Vol. I.

TRANSCRIPT OF RECORD.

SUPREME COURT OF THE UNITED STATES.

OCTOBER TERM, 1893.

No. ~~286~~. 44

THE CONSOLIDATED ELECTRIC LIGHT COMPANY,
APPELLANT,

vs.

THE McKEESPORT LIGHT COMPANY.

APPEAL FROM THE CIRCUIT COURT OF THE UNITED STATES FOR
THE WESTERN DISTRICT OF PENNSYLVANIA.

FILED OCTOBER 17, 1890.

(14,326.)

(14,326.)

SUPREME COURT OF THE UNITED STATES.

OCTOBER TERM, 1893.

No. 286.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY,
APPELLANT,

vs.

THE McKEESPORT LIGHT COMPANY.

APPEAL FROM THE CIRCUIT COURT OF THE UNITED STATES FOR
THE WESTERN DISTRICT OF PENNSYLVANIA.

INDEX.

	Original.	Print.
Caption	1	1
Docket entries	1	1
Bill of complaint	14	7
Subpoena	22	11
Marshal's return	23	12
Demurrer	24	12
Opinion on demurrer	27	13
Order overruling demurrer	28	14
Answer	29	14
Replication	42	22
Order assigning time for taking testimony and appointing H. D. Gamble an examiner	43	23
Order fixing time for taking complainant's evidence in reply	44	23
Stipulation extending time for closing complainant's proofs in reply	45	23
Proof of service of notice of motion for two months in which to take defendant's testimony	46	24
Opinion and order on motion for time to take testimony, &c.	47	24
Motion for extension of time to take defendant's testimony	48	25
Order extending time to take testimony	48	25

JUDD & DETWEILER, PRINTERS, WASHINGTON, D. C., DECEMBER 22, 1893.

	Original.	Print.
Order allowing defendant to impeach William H. Church	49	25
Stipulation for appointment of John H. Kitchen as examiner, &c.	50	26
Order appointing John H. Kitchen as examiner on part of defendant	51	26
Order appointing William T. Farnham as examiner on part of complainant	52	27
Order appointing William T. Farnham as examiner on part of defendant	53	27
Stipulation for appointment of William T. Farnham as examiner, &c.	54	28
Order appointing John A. Shields as examiner on part of complainant	56	28
Evidence-in-chief for complainant	57	29
Exhibits offered	57	30
Testimony of Franklin L. Pope	58	30
Exhibit Sawyer and Man Assignment of October 14, 1878—Assignment from Sawyer and Man to the Electro-Dynamic Light Company, October 14, 1878	113	65
Exhibit Sawyer and Man Assignment of January 9, 1880—Assignment from Sawyer and Man to the Electro-Dynamic Light Company, recorded January 9, 1880	115	66
Exhibit Electro-Dynamic Light Company Assignment of April 6, 1881—Assignment from the Electro-Dynamic Light Company to William H. Church, April 6, 1881	115	66
Exhibit Church Assignment of April 6, 1881—Assignment from William H. Church to the Eastern Electric Manufacturing Company, April 6, 1881	120	69
Exhibit Eastern Electric Manufacturing Company's Assignment of September 30, 1882—Assignment from the Eastern Electric Manufacturing Company to the Consolidated Electric Light Company, September 30, 1882	124	72
Exhibit Sawyer and Man Assignment of April 5, 1881—Assignment from Sawyer and Man to the Electro-Dynamic Light Company, April 5, 1881	130	76
Evidence for defendant	134	78
Exhibits offered	134	78
Testimony of George F. Barker	135	79
Evidence in reply for complainant	138	80
Testimony of Amos Broadnax	138	80
Exhibit Broadnax Sketch	147	86
Stipulation as to facts	242	146
Exhibits offered	243	146
Testimony of J. Edgar Bull	246	148
Exhibits offered	248	149
Evidence from interference case of Sawyer & Man *vs.* Edison	249	150
Testimony of William Sawyer	249	150
William E. Sawyer	266	161
Exhibits offered	281	170
Evidence for defendant	283	171
Notices to take testimony	283	171
Testimony of George W. Sawyer	286	173
John M. D. Keating	325	199
William Hochhausen	332	204

	Original.	Print.
Testimony of William Sharp	362	224
Exhibit Sharp Drawing, figures 1 and 2	405	254
Exhibit Sharp Drawing, figure 3	406	254
Exhibit Sharp's Diagram of Walker-street Shop	419	262
Testimony of Walter K. Griffin	432	271
John M. D. Keating	433	272
Keating Book Exhibit	435	273
Stipulation as to evidence of Thomas A. Edison	436	274
Testimony of Thomas A. Edison	437	274
Charles Batchelor	574	365
Henry E. Vineing	665	425
Cyrus F. Brackett	693	443
Exhibits offered	796	510
Testimony of George F. Barker	801	514
William P. Wilson	861	553
Exhibits offered	892	574
Testimony of William Holzer	893	574
Amos Broadnax	901	579
Jacob Hays	907	583
William Hochhausen	913	587
Albon Man	915	588
William Hochhausen (recalled)	916	589
Hugh R. Garden	917	590
Stipulation as to minutes, &c., of Electro-Dynamic Light Company	921	592
Minutes of board of trustees of Electro-Dynamic Light Company, &c.	922	593
Letter of William D. Baldwin to Thomas Wallace, January 8, 1880	962	618
Stipulation as to evidence	963	619
Evidence in Edison *vs.* Sawyer-Man interference	964	620
Testimony of Martin N. Force	964	620
Edward H. Johnson	971	624
John Kruesi	975	627
Francis R. Upton	979	630
John Kruesi (realled)	996	641
Stephen D. Field	1000	644
Thomas B. Stillman	1002	645
William Sawyer	1007	648
James A. Russell	1010	650
James D. Potter	1012	651
James E. O'Keeffe	1013	652
Francis R. Upton	1016	654
Philip S. Dyer	1021	657
Testimony of Calvin Goddard	1027	661
R. M. Galloway	1031	664
Grosvenor P. Lowrey	1033	665
James Hood Wright	1038	668
Evidence in reply for complainant	1041	670
Testimony of Albon Man	1041	672
Exhibit Man Sketch No. 1	1318	851
Exhibit Man Sketch No. 3	1349	871
Exhibit Man Drawing, December 9, 1887	1446	931

	Original.	Print.
Exhibit Man's Diagram Centre-street Shop, March 27, 1887	1449	933
Exhibit Man Sketch No. 2	1498	963
Exhibit Man,s Diagram Centre-street Shop, March 27, 1887	1651	1057
Exhibit Man's Diagram Walker and Elm Shop, March 27, 1889	1654	1059
Exhibit Man Drawing of Tulip-shaped Lamp, April 2, 1889	1699	1081
Exhibit Cheever Agreement—Agreement between the Electro-Dynamic Light Company and Charles A. Cheever, Jan. 9, 1880	1721	1094
Exhibit Lowrey Letter of October 30, 1878—Letter of G. P. Lowrey to Albon Man, October 30, 1878	1723	1095
Exhibit Man's Letter to Lowrey of October 31, 1878	1725	1096
Exhibit Lowrey Letter of November 6, 1878—Letter of G. P. Lowrey to Albon Man, November 6, 1878	1727	1097
Exhibit Sawyer's Letter, dated March 7, 1878—Letter of W. E. Sawyer, March 7, 1878	1729	1098
Exhibit Lowrey Letter of November 2, 1878—Letter of G. P. Lowrey to Albon Man, November 2, 1878	1730	1098
Testimony of Thomas B. Stillman	1731	1099
Exhibit Stillman No. 1—Drawing	1733	1100
No. 2—Drawing	1736	1100
No. 3—Drawing	1740	1103
Exhibit Stillman Record of Lamp Tests	1745	1103
Exhibit Sawyer-Stillman Letter of March 5, 1879	1765	1119
Testimony of Ida Man Ives	1766	1119
Alice J. Watkins	1772	1123
Hans J. Muller	1776	1125
Edwin L. Hays	1784	1130
David Hennessy	1794	1136
Exhibit Hennessy Memorandum, April 5, 1889	1796	1138
Testimony of Edward Rowe	1797	1138
George S. Beith	1799	1140
Exhibits offered	1803	1142
Testimony of Hugh R. Garden	1804	1143
Edward R. Knowles	1814	1149
James A. Vandegrift	1819	1152
Charles R. Cross	1825	1156
Exhibit Cut of Voltaic Arc	1829	1158
Exhibit Cut of Serrin Arc Lamp	1830	1158
Exhibit Cut of Werdermann Arc Incandescent Lamp	1831	1158
Testimony of Henry Morton	1974	1241
Oliver B. Shallenberger	2085	1313
Frank Stuart Smith	2159	1360
Thomas B. Stillman (recalled)	2172	1368
James W. Packard	2181	1375
Walter K. Griffin	2233	1409
Franklin L. Pope	2234	1410
John M. Robertson	2278	1438
William H. Church	2280	1439
Exhibit Rockwell Kent Letter—Letter of Rockwell Kent to William Church, March 26, 1879	2283	1441
Exhibit Church Statement of Facts, April 26, 1889	2315	1462
Exhibit Tomlinson Telegram—Telegram of John C. Tomlinson to William H. Church, June 28, 188-	2317	1463

	Original.	Print.
Exhibit Church's Letter to Tomlinson—Letter of William H. Church, July 1, 1887	2318	1464
Testimony of Amos Broadnax (recalled)	2319	1464
Edward Berry	2320	1465
Franklin L. Pope (cross)	2325	1468
Tillie J. Sawyer	2392	1513
Evidence for defendant	2399	1518
Testimony of Richard N. Dyer	2399	1518
John C. Tomlinson	2432	1539
Statement of John C. Tomlinson as to his acquaintance with William H. Church	2451	1552
Complainant's Exhibit Penny Encyclopedia Extract	2455	1554

COMPLAINANT'S EXHIBITS.

PATENTS.	Orig'l.	Print.	Original.	Print.
	OFFERED.		COPIED.	
Complainant's patent in suit	57	29	2804	1795
Edison patent No. 1, being No. 214,636	281	170	2706	1703
No. 2, being No. 214,637	281	170	2709	1705
No. 3, being No. 218,866	281	170	2712	1707
No. 4, being No. 219,628	281	170	2714	9
No. 5, being No. 224,329	281	170	2716	11
No. 6, being No. 227,227	281	170	2718	13
No. 7, being No. 227,228	281	170	2721	16
No. 8, being No. 227,229	281	170	2724	19
Sawyer's dynamo-machine patent No. 237,632	1666	1060	4073	2511
Sawyer-Man soapstone switch patent No. 229,476	1667	1061	2764	1752
switch patent No. 210,152	1667	1061	2768	1755
regulator patent No. 205,305	1668	1061	2781	1768
reissue patent No. 10134	1668	1061	2772	1759
electric meter patent No. 210,151	1669	1062	2785	1773
hydrocarbon treatment patent No. 211,262	1857	1174	2512	1591
Edison's patent No. 238,868	1871	1183	2727	1723
No. 248,417	1871	1183	2730	1725
Lane-Fox British patent No. 3988 of 1878	2054	1293	2733	1727
No. 4043 of 1878	2054	1294	2741	1734
No. 4626 of 1878	2054	1294	2747	1740
No. 1122 of 1879	2054	1294	2759	1745
Lichtenstadt patent (U. S.) No. 41627	2056	1295	2492	1578
Heaton patent No. 68863	2056	1295	2494	1579
Russell & Howland patent No. 70474	2056	1295	2505	1587
Robbins & Southmayd patent No. 87295	2056	1295	2509	1589
Sawyer & Man British patent No. 4705 of 1878	2378	1504	2789	1777
Comp. Ex. No. 22—Edison's patent No. 341,644		....	3692	2282
No. 23—Edison's patent No. 263,878		....	3697	2291
No. 24—Edison's patent No. 264,657		....	3701	2293
No. 25—Edison's Canadian patent No. 11968		....	3707	2295
No. 30—Edison's Canadian patent of December 17, 1888		....	3763	2325

DOCUMENTS.	Orig'l.	Print.	Original.	Print.

Deposition of William E. Sawyer			2986	1884
George W. Sawyer			3003	1894
Rebutting testimony on behalf of Sawyer & Man			3007	1896
Second deposition of William H. Church			3007	1896
Second deposition of Albon Man			3025	1907
Notary's certificate to testimony on behalf of Sawyer & Man			3031	1911
Exhibits introduced on behalf of Sawyer & Man, viz:				
No. 1—Drawing			2939	1860
No. 2—Drawing			2946	1863
No. 3—Drawing			2933	1856
No. 4—Drawing			2966	1875
No. 5—Drawing			2982	1883
No. 6—Drawing			2989	1886
No. 7—Drawing			2996	1890
Proofs on behalf of Edison			3032	1912
Notice to take testimony			3032	1912
First deposition of Thomas A. Edison			3034	1912
Stipulation concerning patent put in evidence			3128	1965
Deposition of Martin W. Force			3148	1974
Edward H. Johnson			3155	1978
John Kruesi			3160	1982
—— Upton			3165	1985
Second deposition of John Kruesi			3197	2017
Second deposition of Thomas A. Edison			3201	2019
Deposition of Charles Batchelor			3209	2024
Stephen D. Field			3257	2051
T. B. Stillman			3260	2052
William Sawyer			3268	2055
James A. Russell			3272	2057
James E. O'Keeffe			3276	2059
Notary's certificate			3279	2061
Exhibits introduced on behalf of Edison:				
Edison's Exhibit No. 1—Drawing			3039	1916
No. 2—New York Herald			3046	1919
No. 3—Record of lamps			3134	1968
No. 4—Drawing			3050	1922
No. 5—Drawing			3053	1923
No. 6—Drawing			3061	1926
No. 7—Note book			3145	1973
No. 8—Article from New York Sun			3146	1973
No. 9—Drawing			3096	1946
No. 10—Sheets from Scribner's			3183	1996
No. 11—Record of lamps			3280	2062
No. 13—Drawings			3079	1937
No. 14			3212	2026
No. 23—Draft of article of Sawyer sent to New York Sun			3262	2054
No. 24—Draft of note			3264	2054
No. 25—Sawyer's challenge			3291	2067
Office letter			3292	2068

	Orig'l.	Print.	Original.	Print.
	Offered.		Copied.	
Notice of decision in favor of Sawyer & Man on question of priority of invention			3293	2068
Decision of examiner of interference in favor of Sawyer & Man			3295	2069
Z. F. Wilbur appointed sole attorney			3298	2071
Patent Office proceedings No. 4	243	147	2848	1817
Being file-wrapper and contents of interference proceedings, Sawyer & Man *vs.* Edison.				
Declaration of interference			2852	1817
Drawings accompanying Edison's application			2849	1817
Drawings accompanying Sawyer & Man's application			2851	1817
Preliminary statement of Sawyer & Man			2853	1818
Preliminary statement of Edison			2855	1819
Office letter requiring Sawyer & Man to amend their statement			2856	1819
Office letter requiring Edison to amend his statement			2857	1820
Amended statement of Man			2859	1821
Amended statement of Edison			2860	1821
Official fixing of time for putting in testimony and proofs			2861	1822
Stipulation extending time for taking testimony			2863	1823
Office letter extending time, as per stipulation			2864	1823
Office letter resetting times for putting in proofs			2866	1824
Power of attorney appointing Amos Broadnax attorney for Sawyer & Man in place of Baldwin, Hopkins & Peyton			2867	1824
Office letter notifying parties of Broadnax's appointment			2868	1825
Notice of Sawyer & Man's motion to dissolve interference			2869	1825
Official letter denying motion to dissolve			2870	1826
Notice of appeal to the Commissioner in person			2872	1827
Letter setting day for hearing appeal			2873	1827
Notice of Sawyer & Man's motion to postpone times for taking testimony until after decision of Commissioner			2874	1827
Affidavit of Amos Broadnax			2875	1828
Motion to postpone times granted			2877	1829
Notice of decision by Commissioner denying motion to dissolve			2879	1829
Decision of Commissioner denying motion to dissolve			2880	1830
Letter fixing hearing			2882	1831
Notice of motion for extension of time for putting in testimony			2883	1831
Affidavit of Amos Broadnax			2884	1832
Letter granting motion for extension of time			2885	1833
Letter *in re* stipulation to extend time			2889	1834
Patent Office proceedings No. 5	243	147	3518	2194
Supplemental proofs in reply on behalf of Edison			3519	2194
Notice of taking testimony			3520	2195
Second deposition of F. R. Upton			3521	2195
Deposition of Philip S. Dyer			3526	2198
Notary's certificate			3533	2202

	Orig'l.	Print.	Original.	Print.

1 Among the rolls, records, and judicial proceedings had in the circuit court of the United States in and for the western district of Pennsylvania, in equity, wherein The Consolidated Electric Light Company is complainant and The McKeesport Light Company is defendant, may be found the following words and figures, to wit:

Equity Docket Entries.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
v.
McKEESPORT LIGHT COMPANY.

Broadnax & Bull, Thos. B. Kerr, W. Bakewell & Sons, Magnus Pflaum.

Bill filed December 8, 1887.

Same day subpœna issued, returnable first Monday of January next.

1887, Dec. 9.—Subpœna served personally and by copy upon defendant company by giving a true and attested copy thereof to G. L. Reiber, sec'y and treas. thereof, and also on J. R. Gordon, sup't, by leaving a true copy at their office Mar. 5, '90.

1888, Feb'y 4.—Demurrer to bill filed. On motion of defendant's solicitor, order granted extending time for hearing on demurrer until Feb'y 29, 1888.

1888, Feb'y 29.—Demurrer argued. *C. A. V.*

1888, March 17.—Opinion of the court with order overruling demurrer and allowing defendant 30 days to answer, filed. 2

1888, April 21.—Answer of defendant filed.

Same day complainant's replication filed.

1888, April 24.—Order granted allowing complainant until May 24, 1888, to take its evidence in support of its bill; the defendant until and including Aug. 24, 1888, to take its evidence in defence, with leave to move for further time if necessary and with leave to complainant to move for time to take evidence in reply to defendant's evidence, if it so desires, and appointing H. D. Gamble an examiner to take the same, filed. Same day proof of service of notice of above motion filed.

1888, July 28.—Upon stipulation of counsel presented and filed, order granted appointing John K. Kitchen, Esq., special examiner on part of defendant; testimony taken by him in the city of New York to have like force and effect as if taken by one of the standing examiners of this court, filed. Certificate issued.

1888, September 10.—Order granted allowing complainants three months from Oct. 15 to take its rebutting testimony filed.

1888, Sept. 12.—Testimony on part of complainant taken before H. D. Gamble, examiner, and Complainant's Exhibit "Complainant's Patent" filed.

1888, Nov. 28.—William T. Farnham, Esq., notary public
3 of the city of New York, is named to take testimony on part
of the complainant by the clerk, in pursuance of the 67th
rule in equity, as amended, filed.

1889, February 6.—Stipulation extending time for closing complainant's proofs in reply until and including February 15, 1889, filed. Same day proof of service of notice that complainant will move the court on Sat., Feb'y 9, at 10 a. m., to fix a time for hearing this cause filed.

1889, Feb'y 9.—Motion to fix a time for hearing cause made and motion argued and postponed until Saturday, Feb'y 16, 1889.

1889, Feb'y 11.—Notice of application by defendant for two months' time in which to take further testimony, with proof of service of notice and exception to a part as not in accordance with leave of court, filed.

1889, Feb'y 16.—Affidavits of George F. Barker, Edward H. Johnson, Charles J. Kintner, Amos Broadnax, Frank L. Pope, Walter K. Griffin, J. Hood Wright, and Noah Davis filed on defendant's application for time to take testimony, &c., and arguments had on said motion. *C. A. V.*

1889, Feb'y 18.—Opinion and order allowing defendant 30 days to take further testimony and complainant 30 days thereafter to rebut, and that the cause be set down for hearing at the May term.

1889, February 23.—Motion on part of complainant to strike out
questions 3 to 7 from the deposition of George W. Sawyer
4 taken before William T. Farnham, Esq., and motion argued
by counsel for respective parties and the questions held under
consideration by the court. Same day, upon presentation of stipulation and on motion, order granted appointing Wm. T. Farnham, Esq., N. P. of New York city, examiner. Order made *nunc pro tunc* on motion of defendant's solicitor and same filed.

1889, March 14.—Motion on part of defendant for an extension of 10 days for taking testimony and affidavits of G. P. Lowry and W. K. Griffin for motion and T. B. Kerr in opposition thereto, and after arguments and upon consideration order granted extending defendant's time for closing its testimony until March 23, inclusive, and the period of one month heretofore assigned to the plaintiffs to take proofs in reply, to run from the date above mentioned, filed.

1889, March 26.—In pursuance of the 67 rule in equity, as amended, I hereby name Miss Carrie E. Davison, of New York city, commissioner to take testimony on part of complainants and certificate issued.

1889, April 4.—Order granted appointing John A. Shields, Esq., U. S. com. at New York city, an examiner to take testimony on part of complainant. Same day certificate of appointment issued.

1889, April 9.—Depositions taken before Wm. T. Farnham, N. P., at New York, on part of defendant, of George W. Sawyer, filed.

1889, May 4.—Defendant moves the court for an order
5 to enable it to examine John C. Tomlinson and Richard N.
Dyer, referred to in the cross-examination of the witness

William H. Church, and John Kammer and Henry Mayo, referred to in the cross-examination of the witness Packard, at such times and under such conditions as the court may see fit, etc., with affidavit of W. K. Griffin in support of said motion presented and read and proof of service of notice of said motion filed; and, after argument of counsel *pro* and *con.*, order granted allowing defendant until and including May 7 to call and examine John C. Tomlinson and Richard N. Dyer; the examination of said witnesses to be restricted to the contradiction of the answers of the witness Church on cross-examination and as to the alleged interview of said Church with said Tomlinson and Dyer and the statements by him then made, as detailed in said cross-examination.

1889, May 17.—Testimony of Tillie J. Sawyer, on part of complainant, before H. D. Gamble, examiner, at Lehighton, Pa., filed.

1889, May 21.—The following testimony and exhibits on part of *compl't* and respondent filed:

Depositions of George S. Beith, Amos Broadnax (2), J. Edgar Bull, William H. Church, Chas. R. Cross, Hugh R. Garden, Walter K. Griffin, Edward L. Hays, David Hennessy, Ida Man Ives, Edward R. Knowles, Albon Man, Albon Man (int. dep.), Henry Morton, Hans J. Muller, J. W. Packard, F. L. Pope (2), John M.
6 Robertson, Edw. Rowe, Wm. Sawyer, Wm. E. Sawyer, O. B.
Shallenberger, Frank S. Smith, Thos. B. Stillman (2), J. A. Vandergrift, Alice J. Wakins, and the following stipulations: That the Edison Electric Light Co. is privy to this suit and that Wm. E. Sawyer and Wm. Sawyer are dead; and the following exhibits: Interference proceedings and records of Edison and Sawyer & Man, dep. of Wm. E. and Wm. Sawyer in int. case, agreement between Sawyer & Man, Feb. 5, '78; same of March 19, 1878; same of May 11, '78; Cheever-Man correspondence, Ex. dynamo bill, Ex. ac. and Jay lease, Flannigan agreement, Cheever agreement, Sawyer letter of M'ch 7, 1878; Lowry letter of Oct. 30, '78; same of Nov. 2, '78; same of Nov. 6, '78; Man's letter to Lowry of Oct. 31, '78; Stillman's record of lamp tests, Sawyer-Stillman letter of M'ch 5, '79; Hennessy memorandum, Edison, Maxim, and Swan interference record, Edison's file-wrapper & contents in Edison's application, which was in interference with patent in suit; cert. copy of Dyer & Wilbur letter of Oct. 4, '80; Rockwell-Kent letter, Ap'l 9, '79; Herald article, Scientific American article, Higgs' translation of Fontaine's book, Def't's Ex. 1890, June 10.—Additional affidavit of E. N. Dyer on taxation of costs filed.

1890, October 10.—Decree granted in the above-entitled cause that the bill of complaint be, and the same is hereby, dismissed at the cost of the said complainant filed.

1889, Oct. 10.—Petition of complainant for an appeal from the above decree to the Supreme Court of the United States presented,
and, upon motion, appeal allowed by Honorable M. W. Ache-
13 son, judge; also, citation granted, returnable in U. S. Su-
preme Court on second Monday of October, 1890, by Hon.
M. W. Acheson, J.

Also, bond on appeal in the sum of $5,000, with George Westinghouse, Jr., as surety, presented, and bond approved and filed.

1890, October 10.—Stipulation that certain exhibits offered by defendant need not be copied in the record for the U. S. Supreme Court, filed.

1890, Oct. 10.—Consent of Broadnax & Buhl that Kerr & Curtis may be substituted as solicitors for complainant, filed.

Oct. 11, 1890.—Service of citation accepted by Magnus Pflaum, Esq., of counsel for defendants.

14 In the Circuit Court of the United States in and for the Western District of Pennsylvania.

No. 5, May Term, 1888.

In Equity, on Bill.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY, Complainant,
and
McKEESPORT LIGHT COMPANY, Defendant.

Suit on Patent No. 317,676, Dated May 12, 1885.

To the honorable the judges of the United States circuit court in and for the western district of Pennsylvania:

The Consolidated Electric Light Company, a corporation duly created, organized, and existing under and by virtue of the laws of the State of New York, and especially under and by virtue of a certain act of the legislature of said State, duly approved by the governor thereof, passed February 17th, 1848, and of the several acts supplemental to and amendatory thereof, and having its principal place of business in the city of New York, brings this its bill of complaint against the McKeesport Light Company of McKees- 15 port, Allegheny county, Pennsylvania, a corporation duly created, organized, and existing under and by virtue of the laws of the State of Pennsylvania.

And thereupon your orator, upon information and belief, complains and says: That before the 9th day of January, 1880, William E. Sawyer, then of the city, county and State of New York, but now deceased, and Albon Man, of Brooklyn, in the county of Kings and State of New York, were the joint, first and original inventors of a new and useful improvement in electric lights not known or used before, and not patented or described in any printed publication in this or any foreign country before their invention thereof, and not in public use, or on sale in this country, more than two years prior to their application for letters patent of the United States therefor, and did, on the said 9th day of January, 1880, apply to the Commissioner of Patents of the United States for letters patent for said invention, and did fully and in all respects comply with all the requirements of the law in that behalf, and especially did make oath that they verily believed themselves to be the first, original and joint inventors of the said improvements, and did also pay into the Treasury of the United States the fees required by law, and present to the Commissioner of Patents a petition setting forth their desire to obtain jointly an exclusive property in said improvement, and praying that letters patent might be granted to them jointly; and did also deliver and file in said office of the Commissioner of Patents a written description of their said improvement in such full, clear and exact terms as to enable any one skilled in the art with which the said improvement is most nearly connected to make and use the same, which description was duly signed by the said William E. Sawyer and Albor Man, and attested by two witnesses, as required by law.

That by certain instruments of writing, duly and jointly executed and delivered by said William E. Sawyer and Albon Man,
one bearing date October 14th, 1878, and one dated January
16 8th, 1880, and both duly recorded in the Patent Office,
the whole of said improvements were assigned to the Electro Dynamic Light Company, a corporation duly organized, and then existing under and by virtue of the laws of the State of New York, and by said last-mentioned instrument of writing the Commissioner of Patents was authorized and requested by said Sawyer and Man to issue any patent that might be granted for said improvements to the said Electro Dynamic Light Company as the assignee of the said Sawyer and Man, as by said instruments of writing, both of which are hereby proffered, or duly authenticated copies thereof, ready in court to be produced, will fully appear.

And thereupon due proceedings being had according to law, letters patent of the United States were granted to the said Electro Dynamic Light Company, its successors and assigns for said improvements, as the assignees of said William E. Sawyer and Albon Man, which letters patent were and are executed, recorded, issued and delivered in due form of law, and are dated May 12th, 1885, and numbered 316,367, as by said letters patent, or a duly authenticated copy thereof, ready in court to be produced, as your honors may direct, will fully appear.

That by said letters patent there *were* granted to the said Electro Dyn*o*mic Light Company, its successors and assigns, for the term of 17 years from the date thereof, the sole and exclusive right to make, use and vend the improvements in electric lights described, illustrated and claimed in said letters patent throughout the United States and the Territories thereof, as by said letters patent hereby proffered will fully appear.

That a d*i*scription and claims of said improvements in electric
lights *is* given in the words of said William E. Sawyer and
17 Albon Man, in a specification annexed to said letters patent,
and making part thereof, as required by law, and as fully appears by said letters patent.

And your orator further shows unto your honors that by two certain instruments of writing, both dated April 6th, 1881, and recorded in the Patent Office October 5th, 1882, made, or caused to be made, executed and delivered in due form of law by the said Electro Dynamic Light Company, the whole of the title to said letters patent and invention were conveyed to the Eastern Electric Manufacturing Company, of Middletown, Connecticut, a corporation created, organized and existing under and by virtue of the laws of the State of Connecticut, and then having an office and factory in the city of New York, as by said instruments of writing, hereby duly proffered, or duly authenticated copies thereof, ready in court to be produced, will fully appear.

That by a certain instrument of writing, dated September 30th, 1882, recorded in the Patent Office October 5th, 1882, the said Eastern Electric Manufacturing Company conveyed the whole of the title to said letters patent and invention, and all its rights of action thereunder accruing to your orator, as by said instrument of writing, hereby duly proffered, or a duly authenticated copy thereof, ready in court to be produced, will fully appear.

That your orator is now the sole and exclusive owner of said letters patent and invention, and of all rights of action thereunder accruing, and brings the same here in court ready to be produced as your honors may direct.

That said invention is of great public utility, and your orators has expended large sums of money in the purchase of said letters patent, and in perfecting said improvements and in introducing the same in public use. That your orator is now engaged in the manufacture and sale of said improvement in electric lights, and has been and is now ready and able to fully supply the public demand for
the same, and but for the infringements hereinafter com-
18 plained of, would now — able to fully supply the public de-
mand for the same, and but for the infringements hereinafter complained of, would now be in the peaceful possession and enjoyment of said letters patent and invention, and of the income derivable therefrom.

But your orator shows to this court that the defendant hereinbefore named, as your orator is informed and believes, having notice of said letters patent, and well knowing all the facts and circumstances hereinbefore set forth, with the intent and effect of injuring your orator, and in open and palpable disregard of its rights, has been, and is now infringing said letters patent, and using said invention and availing itself of the gains and profits derivable therefrom to the great loss and damage *to* your orator.

That said defendant, without the license of your orator, against its will, in violation of its rights and of said letters patent, numbered and dated as aforesaid, for said improvement in electric lights, has in the western district of Pennsylvania, caused to be used, and is now using and causing to be used, and threatens and intends still to continue to use, and caused to be used in the western district of Pennsylvania, as aforesaid, said patented invention of an improvement in electric lights, described and claimed in and by said letters patent in whole or in some material parts thereof, and the title to which is thus by law vested in your orator, and that said defendant by such using, and causing to be used has, and is now, and intends to continue to infringe said letters patent in said western district of Pennsylvania, in some material part or parts thereof by using, and causing to be used, electric lights and lamps substantially the same in principal, purpose, construction and mode of operation as the improvement in electric lights described, illustrated and claimed in said letters patent numbered and stated as aforesaid.

That said actions and doings of defendant are contrary —
19 this sort are properly cognizable and relievable, and to the
end that said defendant may, if it can, show why your orator should not have the relief hereby sought, your orator prays that the said McKeesport Light Company, over its corporate name and seal, and upon the oath of such of its officers as have the management of its affairs, and to the best of its or their knowledge, remembrance,

information and belief, full, true, direct and perfect answer make to all the averments, statements of facts and matters and things hereinbefore set forth and charged, and that as fully and particularly as if the same were here again repeated, and the defendant especially interrogated thereto.

And your orator further prays that said defendant may be strictly enjoined and restrained preliminarily and finally by a writ or writs of injunction, issuing out of and under the seal of this honorable court, from directly or indirectly, using or causing to be used, said improvements in electric lights, any or either of them, or any substantial or material part thereof, described and claimed in said letters patent, and such it is now and has been using, as hereinbefore set forth, or such as are substantially the same, or as embody the said patented invention of your orator, and from in any way directly or indirectly infringing said letters patent or any part thereof.

And your orator further prays that said defendant, its agents, associates and confederates, may be decreed to account for and pay over to your orator the gains and profits by them or either of them made or realized by making, using and vending said improvements in electric lights, or any part thereof, and also all damages sustained by your orator, in thrice the amount actually suffered by your orator, by reason of said infringement of said patent, and that your orator may have such further and other relief as may be consistent with equity and good conscience.

And may it please your honors to grant unto your or*or*ator,
20 in thrice the amount actually suffered by your orator, by
reason of said infringement of said patent, and that your
orator may have such further and other relief as may be consistent with equity and good conscience.

And may it please your honors to grant unto your orator not only a writ of injunction, issuing out of and under the seal of this honorable court, directed to said defendant, its agents, servants, attorneys, workmen, employees, associates and confederates, each and every one of them, commanding, enjoining and restraining them, and each and every one of them, both preliminarily and permanently, as your orator has above prayed and in that behalf prays, but also a writ or writs of subpœna, issuing out of and under the seal of this honorable court, directed to the said McKeesport Light Company, the defendant herein, commanding it to appear at a certain time and place in this court to answer the premises and to stand to and abide by such orders and decrees herein as may be consistent with equity and justice, and as may be made against it.

THE CONSOLIDATED ELECTRIC LIGHT CO.,
By GEO. WESTINGHOUSE, JR., *President.*

BROADNAX & BULL,
Complainant's Solicitors.
AMOS BROADNAX,
THOMAS R. KERR,
Of Counsel.

UNITED STATES OF AMERICA,
Southern District of New York, } *ss:*

George Westinghouse, Jr., being duly affirmed, deposes and says that he is president of The Consolidated Electric Light Company, the complainant herein, and has the general management of 21 its business; that he has read the foregoing — verily believes that the said William Edward Sawyer and Albon Man were the first, original and joint inventors of the invention described and claimed in the aforesaid letters patent.

GEO. WESTINGHOUSE, JR.

Subscribed and affirmed to before me this 5th day of December, 1887.

JOSEPH GUTMAN, JR.,
[L. S.] *United States Commissioner, Southern Dist. of N. Y.*

Bill filed December 8, 1887.

22 *Chancery Subpœna.*

UNITED STATES OF AMERICA,
Western District of Pennsylvania. }

The United States of America to McKeesport Light Company, a corporation organized under the laws of the State of Pennsylvania, Greeting:

We command you and every of you that you appear before our judges of our circuit court of the United States of America for the western district of Pennsylvania, at the city of Pittsburgh, in said district, on the first Monday of January, 1888, to answer the bill of complaint of The Consolidated Electric Light Company, a corporation organized under the laws of the State of New York, for infringement of letters patent filed in the clerk's office of said court, in the city of Pittsburgh, then and there to receive and abide by such judgment and decree as shall then or thereafter be made, upon pain of judgment being pronounced against you by default; and this you are in nowise to omit under such penalties as are inflicted by the laws of the United States.

Witness the Hon. Morrison R. Waite, Chief Justice of the Supreme Court of the United States of America, at the city [SEAL.] of Pittsburgh aforesaid, this 8th day of December, in the year of our Lord one thousand eight hundred and eighty-seven, and of our Independence the 112th.

H. D. GAMBLE, *Clerk.*

MEMORANDUM.—The above-named defendant is required to enter an appearance in the above-entitled cause on or before the first Monday of the month ensuing twenty days after the service of this writ; otherwise the complaint may be taken against it as confessed and a decree entered accordingly.

H. D. GAMBLE, *Clerk.*

23 *Service.*

And now, Dec. 9th, 1887, served the within writ on the McKeesport Light Company, defendant company herein named, by giving a true and attested copy of this writ to G. L. Reiber, secretary and treasurer of the company, at McKeesport, and making known to him the contents hereof; also on J. R. Gordon, superintendent, by leaving a true copy at their office in McKeesport, Pa.

So ans.—

United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT CO., Complainant, *against* McKEESPORT LIGHT COMPANY, Defendant.	In Equity. No. 5. May T., 1888. Suit on Patent No. 317,676.

The demurrer of The McKeesport Light Company, defendant, to the bill of complaint of The Consolidated Electric Light Company, complainant.

This defendant, by protestation, not confessing or acknowledging all or any of the matters and things in the said bill of complaint to be true in such manner and form as the same are therein and thereby set forth and alleged, does demur thereto, and for cause of demurrer showeth that it appears by the complainant's own showing, by its said bill of complaint, that letters patent of the United States numbered 317,676, dated May 12th, 1885, and granted to the Electro-Dynamic Light Company, upon which this suit is brought, are void and of no effect and were issued to it without warrant of authority of law for the reasons, as appears by said bill of complaint, that the said Electro-Dynamic Light Company had assigned all its right, title, and interest in and to the invention and improvement in the said letters patent described and claimed by two instruments of assignment duly made, executed, and delivered, and entered of record in the Patent Office prior to the issuance of said letters patent to it. 25

The said Electro-Dynamic Light Company, as appears by said bill of complaint, being neither the inventor and having no interest of record in the improvement in said letters patent described, and having no right to receive the same, and there being no authority or warrant of law to issue the same to it, said letters patent are null and void as aforesaid.

Wherefore, and for divers other good causes of demurrer appearing in said bill, this defendant doth demur to the said bill and to all the matters and things therein contained and humbly demands the judgment of this court whether it shall be compelled to make any other or further answer to the said bill, and prays to be hence dismissed with its costs and charges in this behalf most wrongfully sustained.

MAGNUS PFLAUM,
Solicitor for Defendant.

MAGNUS PFLAUM, *Of Counsel.*

26 I, Magnus Pflaum, do hereby certify that in my opinion the foregoing demurrer of The McKeesport Light Company, defendant, to the bill of complaint of The Consolidated E. Light Company, complainant, is well founded in law and proper to be filed in the above cause.

MAGNUS PFLAUM,
Solicitor for D'f't.

West Dist. of Penna., *ss:*

John Muse, being duly sworn, deposes and says that he is president of the McKeesport Light Company; that he has read the foregoing demurrer to the bill of complaint in this suit, and that the same is not interposed for the purpose of delaying said suit or any proceeding therein.

JOHN MUSE.

Sworn to before me this 7th day of February, 1888.

27 *Opinion on Demurrer & Order.*

In the Circuit Court of the United States for the Western District of Pennsylvania.

The Consolidated Electric Light Co.
v.
The McKeesport Light Co.
No. 5. May Term, 1888.
In Equity.

Sur Demurrer to Bill of Complaint.

Acheson, *J.:*

The precise question here presented was raised in the case of The Consolidated Electric Light Co. *v.* Edison Electric Light Co., 25 Fed. Rep., 719, and was decided favorably to the plaintiff. I have carefully read the opinion of Judge Wallace and perceive no reason for doubting the correctness of his conclusion. How can it be said that the patent was issued without authority of law, and therefore

is void, when in fact it was issued to the very person designated by section 4895, R. S., viz., "the assignee of the inventor?" There was, indeed, a literal compliance with the provisions of the statute. But as, by operation of law, the legal title to the patent was the issuance thereof, *eo instanti*, vested in the plaintiff as the ultimate assignee, the substantial result was the same as if it had formally issued to the plaintiff. Gayler *v.* Wilder, 10 How., 477. While
28 this view saves the patent and subserves the justice of this case, it neither runs counter to sound public policy nor tends to any evil consequences so far as I can see.

And now, March 17, 1888, the demurrer is overruled with leave to the defendant to answer the bill within thirty days.

BY THE COURT.

Filed March 17, 1888.

H. D. GAMBLE, *Clerk.*

29 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY, Complainant,
vs.
MCKEESPORT LIGHT COMPANY, Defendant.
In Equity. On Letters Patent No. 317,676.

The answer of the defendant, McKeesport Light Company, to the bill of complaint exhibited against it by The Consolidated Electric Light Company, the complainant herein.

The defendant, now and at all times hereafter reserving to itself all and all manner of benefit of exception to the manifold errors, uncertainties, imperfections and insufficiencies in the said bill of complaint contained for answer thereunto, or unto so much and such parts thereof as it is advised it is material and necessary for it to make answer unto, answering, says:

I. That it admits that it, the said defendant, is a corporation, created, organized, and existing under and by virtue of the laws of the State of Pennsylvania, and having its principal place of business in the city of McKeesport, in said State; but whether the complainant, The Consolidated Electric Light Company, is a corporation duly created, organized and existing as alleged in the bill of
30 complaint, this defendant does not know, and is not informed, and therefore denies the same; and it leaves the complainant to make such proof thereof as it may be advised.

II. That, as defendant is informed and believes, letters patent of the United States for an alleged invention for an "improvement in electric lights," being numbered 317,676, were on the 12th of May, 1885, issued to a certain alleged corporation, to wit, the Electro-Dynamic Light Company, as assignee of one William Edward Sawyer and one Albon Man; but whether said letters patent were duly issued upon due application made and upon due formalities, and in due and proper form, and in compliance with the various provisions and the requirements of law, and whether due examination was made and due proceedings were had in the United States Patent Office, and whether any, or if any, what adjudication was made in said office as alleged in the bill of complaint, this defendant has no knowledge or information, and leaves the complainant to make, and demands that it make, such full and strict proof in regard to the same as it may be advised is material or necessary.

III. That this defendant, further answering, denies on information and belief that the said invention upon which letters patent No. 317,676 were granted was not patented or described in any printed publication in this or any foreign country before the date of the said alleged invention, or that the application for said letters patent for said invention was made before the same was put in public use or on sale for more than two years, as alleged in the bill of complaint, but avers that said alleged improvements were fully shown and described before the date of the alleged invention thereof by the said Sawyer & Man in printed publications and patents hereinafter mentioned and were publicly made, used and sold for more than two years prior to the filing by the said William Edward Sawyer and Albon Man of the application upon which said letters patent, numbered 317,676, were subsequently granted.

31 IV. That this defendant denies upon information and belief, that William E. Sawyer and Albon Man were the first and original inventors of the improvements described in said letters patent; and further denies upon information and belief, that they were the joint inventors of the same, and alleges that the same are therefore void, and, on information and belief, defendant alleges that at the date at which complainant pretends to have acquired its title to the said letters patent, it was well known to the complainant and to its various officers that the said alleged invention was not the joint invention of the said Sawyer and the said Man, but, in so far as the said improvement was the invention of either, it was the separate invention of the said Sawyer, and that the said Sawyer had so declared repeatedly and in the most public and solemn manner; and that defendant verily believes that complainant bought and acquired whatever interest it now owns, or has ever owned in the said patent, with the full knowledge that the said patent was invalid.

V. That this defendant has no knowledge or information whether the Electro-Dynamic Light Company and the Eastern Electric Manufacturing Company are or were corporations duly created, organized and existing and having their offices of business, all as alleged in the bill of complaint, or were legally capable of receiving or of making the assignments alleged in said bill of complaint, and therefore denies the same, and leaves the complainant to make such full and strict proof in regard to all such averments as it may be advised is material or necessary.

VI. That this defendant does not know and is not informed whether the said invention or said letters patent were assigned by said William Edward Sawyer and Albon Man to the said Electro-Dynamic Light Company, or by said company, assigned to the said Eastern Electric Manufacturing Company, or by said last-named

company assigned, with all its rights of action thereunder to
32 the complainant herein, as alleged in the bill of complaint,
or whether said alleged assignments, or any of them, were duly recorded in the Patent Office; and this defendant therefore denies the same and leaves the complainant to make such proofs of said assignments and of each of them, and of the power of each of said alleged assignors and assignees and of the complainant to hold or assign said invention or letters patent, as it is advised.

VII. That this defendant has no knowledge or information that the complainant is the sole and exclusive owner of said letters patent and invention and of all rights of action thereunder, as alleged in the bill of complaint, and therefore denies the same and leaves the complainant to make strict proof thereof.

VIII. That this defendant denies upon information and belief that the said invention, as described by said letters patent, is of great or any public utility, or that the complainant has expended large or any sums of money in the purchase of said letters patent, or in perfecting said improvements, or in introducing the same in public use, or that the complainant is engaged in the manufacture and sale of said improvement, or is now ready and able to fully supply the public demand for the same; but this defendant, on information and belief, avers the fact to be that said invention is of no public utility whatever, and has never been introduced in public use, and that the complainant is not engaged in the manufacture and sale of said improvement, and that there is no public demand for the same. And this defendant avers, on information and belief, that the said complainant is engaged in the manufacture and sale of electric lamps embodying other and different inventions from that described in said letters patent, which other and different inventions are described and claimed in certain letters patent granted upon the inventions of Thomas A. Edison, under which this defendant is operating; that the complainant has been sued for infringement of the
said letters patent granted upon the said inventions of Thomas
33 A. Edison in the United States circuit court for the southern
district of New York, and that such suits are now pending.

IX. That this defendant denies, upon information and belief, that it has ever infringed at all or in any way, either in the western district of Pennsylvania or elsewhere, upon the said letters patent or any rights of the complainant thereunder, or that it is now infringing upon the same, or intends so to do, either by using or vending the said alleged inventions, or otherwise; and further denies that it has infringed or is now infringing the said letters patent, in any material parts thereof, in the western district of Pennsylvania, or elsewhere, by selling or using, or causing to be used or sold in the western district of Pennsylvania, or elsewhere, the said alleged invention of an improvement in electric lights, in any material parts thereof, substantially the same in principle, purpose, construction and mode of operation as that described and claimed in said letters patent, or that it has made any profit therefrom, or in any way damaged or injured the complainant thereby.

X. That this defendant, upon information and belief, alleges that said letters patent are null and void, because that at and prior to the time said letters patent were issued to the said Electro-Dynamic Light Company it had ceased to exist as a corporation, and was incapable in law of taking, receiving or holding the same.

XI. That this defendant further alleges that said letters patent were issued without authority or warrant of law, and are null and void, because at and prior to the time the said letters patent were issued to the said Electro-Dynamic Light Company, it had parted with all interest in the said invention and in the patent to be procured therefor by certain instruments of assignment duly recorded in the Patent Office, the said Electro-Dynamic Light Company at the time of the issuance of letters patent aforesaid, to wit, 34 being neither the inventor of said improvement nor the assignee of the inventor within the meaning of the statute in such case made and provided.

XII. That this defendant alleges that the said letters patent are for a different, distinct, and separate invention from that which was described in the original application of Sawyer and Man; and that said application was fraudulently and unduly enlarged and changed by making substantial or material changes, omissions or additions in the specifications and claims thereof, and that this was done years after said application was filed, and after the death of one of the alleged joint inventors named in said application, to wit, William E. Sawyer, and after intervening rights had accrued in individuals and the public, and that the said letters patent, as issued, were not based upon a proper application as required by the statute, and are, therefore, null and void.

XIII. That this defendant avers, upon information and belief, that not only was the said original application of Sawyer and Man fraudulently and unduly enlarged and changed and the said letters patent No. 317,676 issued for the different, distinct and separate invention from that which was described in the said original application of Sawyer and Man, but that prior to the issuance of said letters patent No. 317,676 an application for a patent had been filed in the office of the Commissioner of Patents by one Thomas A. Edison, describing and claiming said different and separate invention and upon which the said Edison was seeking a patent; that the said Thomas A. Edison requested the Commissioner of Patents to declare an interference between his said application and the said application of Sawyer and Man upon the said different and separate invention and protested against the issuing of the said letters patent No. 317,676 without such an interference; but, notwithstanding this fact, and notwithstanding the solemn protest of the said Thomas A. Edison against the issue of a patent upon said application of 35 Sawyer and Man for the said different and separate invention without interference first being had with said Edison as to said invention, the said letters patent were obtained surreptitiously and by fraud and without an interference with the application of said Edison as provided by law, although said Edison was at all times ready to contest the question of priority of invention before the Commissioner of Patents, and was seeking a patent for the same invention by an application for said different and separate invention then pending, and which interfered with the said application of Sawyer and Man.

XIV. That this defendant alleges, upon information and belief, that the said letters patent are void and of no effect, because the said Sawyer and Man did not by said letters patent, reveal to persons skilled in the art, or to others, knowledge of any new and useful invention or improvement, or knowledge of any value or importance whatever; and that the devices shown and described in said letters patent, or material and substantial parts thereof, are inoperative and impracticable.

XV. And this defendant, further answering, says that it is advised and avers that the specification of said letters patent does not sufficiently describe the things attempted to be covered by the claims thereof, to enable persons skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct and use the same.

XVI. That, as this defendant is informed and believes, the said letters patent, and each and every part thereof, are void and of no effect in law, because that the said alleged invention had been prior to the said alleged invention or discovery thereof by Sawyer and Man, shown and described in the following-named letters patent, to wit:

In letters patent of the United States:
No. 20706, June 29th, 1858, Gardiner & Blossom.
No. 166,877, August 17th, 1875, Kosloff.
36 No. 181,613, August 29th, 1876, Woodward.

In letters patent of the Kingdom of Great Britain:
No. 8644, 1840.
No. 9053, 1841, De Moleyns.
No. 10919, 1845.
No. 11076, 1846, Greener & Straite.
No. 11783, 1847.
No. 12212, 1848, Straite.
No. 13302, 1850, Shepard.
No. 212, 1852, Slater & Watson.
No. 14198, 1852, Roberts.
No. 119, 1853, Binks.
No. 2547, 1856, Way.
No. 588, 1857, Harrison.
No. 3164, 1857, Burleigh & Danchell.
No. 2841, 1857, Way.
No. 282, 1858.
No. 188, 1862.
No. 847, 1865, Gordon.
No. 3809, 1872, Konn.
No. 91, 1873, Konn.
No. 441, 1875.
No. 970, 1875.
No. 4805, 1876, Werdemann.
No. 4905, 1876, Varley.

No. 1996, 1877.
No. 2585, 1877, Prosser & Moore.
No. 4432, 1877, Rapieff.
No. 861, 1878, Scott.
No. 3470, 1878, Harrison.
No. 3988, 1878.
No. 3991, 1878, Clark.
No. 4043, 1878.
No. 4595, 1878, Heinrichs.
No. 4774, 1878, Pulvermacher.
No. 5281, 1878.

In letters patent of France:
No. 4606, 1849, Le Molt.
No. 7469, 1851, Nollett.
37 No. 113,706, July 12, 1876, Gaudin.

Certificates of addition thereto, dated April 7, 1877, and June 12, 1877.

In letters patent of Belgium:
No. 542, 1851, Nollett.

And various other letters patents not now known to this defendant, but which, when ascertained, the defendant prays leave to make a part of this answer by proper amendment and averment.

XVII. That, as this defendant is informed and believes, the said letters patent and each and every part thereof are void and of no effect in law, because the said alleged invention had been described in some printed publications prior to the supposed or alleged invention or discovery thereof by Sawyer and Man, among which are the following, to wit:

Philosophical Transactions of the Royal Society, London, 1809, p. 32 *et seq.*

Philosophical Transactions of the Royal Society, London, 1815, p. 363 *et seq.*

American Journal of Science and Arts, New Haven and New York, 1853, vol. 16, p. 271.

English Mechanic and World of Science, London, 1875, vol. XXI, p. 611.

New York Herald, a newspaper published at New York city, December 20th, 1879.

And in various other printed publications not now known to this defendant, but which, when ascertained, the defendant prays leave to make a part of this answer by proper amendment and averment.

39 XVIII. That, as this defendant is informed and believes, the said letters patent, and each and every part thereof, are void and of no effect in law, because the said alleged joint inventors, Sawyer and Man, were not the original and first inventors or discoverers of said alleged invention or discovery, or of any material or substantial part thereof, but that the same, and every material and substantial part thereof, had been, prior to the said alleged invention thereof by Sawyer and Man, either known to, or used by, or both known to and used by the following persons at the places set opposite their names respectively, which persons reside now, to the best of the defendant's knowledge and belief, at the places respectively specified, to wit:

Name.	Where known or used.	Present residence.
Edward Weston	Newark, N. J.	Newark, N. J.
Moses C. Farmer	Salem and Boston, Mass., and elsewhere	New York city.
Thomas A. Edison	Menlo Park and Newark, N. J.	Llewellyn Park, N. J.
Hiram S. Maxim	New York city and elsewhere	London, England.
Nathaniel S. Keith	New York city and elsewhere	New York city.
Charles Batchelor	Menlo Park, N. J., and elsewhere	New York city.
Francis R. Upton	Menlo Park, N. J., and elsewhere	Orange, N. J.
John Kruesi	Menlo Park and elsewhere	Brooklyn, N. Y.
John F. Ott	Menlo Park and elsewhere	Newark, N. J.
Martin N. Force	Menlo Park and elsewhere	Menlo Park, N. J.

and various other persons whose names and residences are not now known to this defendant, but which, when ascertained, it prays leave to make a part of this answer by proper averment and amendment.

XIX. That, as this defendant is informed and believes, in view of the state of the art to which said alleged invention or discovery pertains, or with which it is most nearly connected, there was no invention in anything done by said Sawyer and Man, as shown and described in said letters patent.

XX. That this defendant is informed and believes that the said William Edward Sawyer and Albon Man surreptitiously and unjustly obtained the patent No. 317,676 for that which had been invented by another, viz., by one Thomas A. Edison, who was using reasonable diligence in adapting and perfecting the same, and said letters patent are therefore null and void.

XXI. And now, this defendant having answered to the various matters and things set up in the bill of complaint, denies that the complainant is entitled to the relief prayed for, or any part thereof, and this defendant prays the same advantage of the matters contained in this answer as if the same had been set up by plea or demurrer, when a plea or demurrer would have been proper, especially as to the ninth paragraph hereof.

And this defendant denies all and all manner of unlawful and other combinations and false pretending by the bill charged without this, that there is any other matter, cause or thing in the said bill of complaint contained (material or necessary to make answer unto, and not herein and hereby well and sufficiently answered, confessed, traversed and avoided or denied) true to the knowledge or belief of this defendant, all which matters and things the defendant is ready and willing to aver, maintain and prove, as this honorable court shall direct, and hereby prays to be hence dismissed, with its reasonable costs and charges, in this behalf most wrongfully sustained.

MAGNUS PFLAUM,
Solicitor for Defendant.

JOHN A. TOMLINSON,
RICH. N. DYER, *Of Counsel.*

41 STATE OF ——, } *ss:*
County of——, }

—— ——, being duly sworn, deposes and says that he is the — of The McKeesport Light Company, the defendant in this suit; that he has read the foregoing answer and knows the contents thereof, and that the same is true of his own knowledge, except as to the matters therein stated to be alleged on information and belief, and as to those matters he believes it to be true.

—— ——.

Sworn to before me this — day of——, 1888.

—— ——.

It is agreed by counsel for complainant that the foregoing answer may be filed without signature and affidavit of the defendant, which are hereby waived.

42 *Replication.*

Circuit Court of the United States, Western District of Penna.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY, Compl't,
vs.
MCKEESPORT LIGHT COMPANY, Def't.
No. 5. May Term, 1888.
In Equity.

Replication.

The replication of The Consolidated Electric Light Company, complainant, to the answer of McKeesport Light Company, defendant.

This repliant, saving and reserving to itself all, and all manner of advantage of exception to the manifold insufficiencies of the said answer, for replication thereunto says that it will aver and prove its said bill to be true, certain and sufficient in the law to be answered unto; and that the said answer of the said defendant is uncertain, untrue and insufficient to be replied unto by th- repliant; without this, that any other matter or thing whatsoever in the said answer contained, material or effectual in the law to be replied unto, confessed and avoided, traversed or denied, is true; all which matters and things this repliant will be ready to aver and prove, as this honorable court shall direct; and humbly pray-, as in and by its said bill it has already prayed.

THOMAS B. KERR,
Solicitor for Complainant.

Filed April 21, 1888.

H. D. GAMBLE, *Clerk.*

Opinion and Order sur Above Application.

Per Curiam:

It is very clear to us that as a matter of strict legal right the defendant is not entitled to an order allowing the introduction at this stage of the case of evidence-in-chief. It was the duty of the defendant to put in the proofs in support of such of the defenses as were relied on within the period of three months heretofore assigned for that purpose, and we recognize the cogency of the objections urged against the allowance of the present application. Nevertheless, that there may be no possible failure of justice, we have concluded to grant the defendant leave to take further evidence to sustain the defenses generally, but we will limit the time for so doing to one month from this date. At the end of that period the plaintiff shall have one month to put in evidence in reply, and the cause shall be set down for final hearing at the next term of the court; and it is so ordered.

Filed Feb'y 18, 1889.

H. D. GAMBLE, *Clerk.*

48 *Motion for an Extension of Time for Taking Defendant's Testimony and Order Thereon.*

In the United States Circuit Court, Western District of Pennsylvania.

CONSOLIDATED ELECTRIC LIGHT COMPANY *v.* THE MCKEESPORT LIGHT COMPANY.	No. 5. May Term, 1888. In Equity.

And now, March 14, 1889, Magnus Pflaum, solicitor for defendants, moves the court for an order extending defendants' time to take testimony, under the general defenses set forth in the answer, ten days from the expiration of the time assigned to defendants by the order of the court herein of February 18, 1889, and for such further or other relief as may be just.

And now, March 14, 1889, the above motion — argued by counsel, and thereupon, upon consideration, it is ordered that the time for taking the defendants' testimony be extended until Saturday, the 23d day of March, 1889, inclusive, the period of one month heretofore assigned to the plaintiffs to take proofs in reply to run from the date above last mentioned.

BY THE COURT.

Filed March 14, 1889.

49 *Order Permitting Defendants to Take Testimony in Impeachment of Testimony of W. H. Church.*

United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT CO.
v.
MCKEESPORT LIGHT COMPANY.

On motion of defendant, by Walter K. Griffin, its counsel, and on reading and filing the affidavit of said W. K. Griffin, annexed to the notice of motion, and after hearing counsel for the respective parties, it is ordered that defendant have to and including Tuesday, May 7, 1889, to call and examine John C. Tomlinson and Richard N. Dyer as witnesses in its behalf; the examination of said witnesses to be restricted to the contradiction of the answers of the witness William H. Church on cross-examination by Mr. Griffin and as to the alleged interviews of said Church with said Tomlinson and Dyer and the statements by him then made, as detailed in said cross-examination.

By the Court.

51 *Order Appointing J. H. Kitchen Examiner on Part of Defendant.*

United States Circuit Court, Western District of Pennsylvania.

The Consolidated Electric Light Company *against* The McKeesport Light Company.	No. 5. May T., 1888. In Equity. Letters Patent No. 317,676.

On reading and filing the annexed stipulation entered into between the solicitors for the respective parties to the above-entitled suit;

It is ordered that John H. Kitchen, Esq., one of the standing examiners of the circuit court of the United States, for the southern district of New York, be and he hereby is appointed special examiner in the above suit to take the proofs on behalf of the defendant therein, and

It is further ordered that such proofs may be taken in the city of New York, and with the same force and effect as though taken before one of the standing examiners of the circuit court of the United States for the western district of Pennsylvania.

Dated July 28th, 1888.

[SEAL.] By THE COURT.

Filed July 28, 1888.

52 *Appointment of Wm. T. Farnham Examiner.*

United States Circuit Court, Western District of Pennsylvania.

Consolidated Electric Light Co.
v.
McKeesport Light Co.
No. 5. May T., 1888.
Equity.

On motion of W. Bakewell & Sons, William T. Farnham, notary public of the city of New York, is hereby appointed examiner to take testimony of witnesses and other evidence on part of complainant.

H. D. GAMBLE, *Clerk.*

Filed November 28, 1888.

H. D. GAMBLE, *Clerk.*

53 *Order Appointing Wm. T. Farnham Examiner on Part of Defendant.*

In the Circuit Court of the United States for the Western District of Pennsylvania.

Consolidated Electric Light Company
vs.
McKeesport Light Company.
No. 5. May Term, 1888. In Equity.

Upon presentation to the court of the stipulation hereto attached, entered into by the respective solicitors for complainant and defendant.

It is ordered, that Wm. T. Farnham, a notary public in the city of New York, State of New York, be and he hereby is appointed special examiner in the above suit to take proofs on behalf of the defendant therein under the order of this court dated the 18th day of February, 1889, and during any extensions of time given the defendant by such order, and that the proofs so taken before the said Wm. T. Farnham shall have the same force and effect as though taken before one of the standing examiners of the circuit court of the United States for the western district of Pennsylvania. This order of appointment is made *nunc pro tunc.*

Dated Feb'y 23, 1889.

By THE COURT.

54 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
v.
THE McKEESPORT LIGHT CO.

No. 5. May Term, 1888.
In Equity.

It is hereby stipulated and agreed by and between the parties to the above-entitled suit that William T. Farnham, Esq., of New York city, be appointed special examiner in the above suit to take proofs on behalf of the defendant herein under the order of the court dated the 18th of February, 1889, and during any extensions of the time given the defendant by such order, and that the proofs so taken before the said William T. Farnham shall have the same force and effect as though taken by one of the standing examiners of the circuit court of the United States for the western district of Pennsylvania; and

It is further agreed and stipulated that an order in conformity with this stipulation may be entered by the defendant in the above-entitled suit at any time without notice *nunc pro tunc* as of the date of this stipulation.

55 Dated New York, February 21st, 1889.

THOMAS B. KERR,
For Complainant.
MAGNUS PFLAUM,
For Defendant.

H. D. GAMBLE, *Clerk.*

56 *Order Appointing John A. Shields Ex'r Com.*

In the Circuit Court of the United States for the Western District of Pennsylvania.

CONSOLIDATED ELECTRIC LIGHT COMPANY.
vs.
McKEESPORT LIGHT COMPANY.

No. 5. May Term, 1888.
In Equity.

And now, to wit, April 4, 1889, upon motion of Thos. B. Kerr, Esq., solicitor for the complainant, John A. Shields, an U. S. com'r for the southern district of New York, residing in the city of New York, is specially appointed an examiner to take testimony on behalf of the complainant in the above-entitled suit, as provided by the 67th rule, in equity, and the amendments thereto.

BY THE COURT.

Filed April 4, 1889.

H. D. GAMBLE, *Clerk.*

57 *Complainant's Evidence-in-chief.*

Testimony taken on behalf of complainant *of* final hearing, pursuant to the 67th rule, in equity, as amended, before H. D. Gamble, Esq., special examiner.

Pittsburgh, Pa., *May 8th*, 1888.

Met pursuant to notice.

Present: Thomas B. Kerr, Esq., on behalf of complainant; John C. Tomlinson, Esq., on behalf of defendant.

Proof of the incorporation of the complainant and defendant corporations is hereby waived.

Counsel for complainant offers in evidence a certified copy of the patent in suit, No. 317,676, granted on May 12th, 1885, to the Electro Dynamic Light Company of New York, assignee of William E. Sawyer and Albon Man, and the same is marked "Complainant's Exhibit Complainant's Patent, H. D. G., examiner."

(Objected to by counsel for defendant as irrelevant, and upon the further ground that the patent is invalid, having been issued to an assignee, who had, prior to the grant of the patent, parted of record with all interest in the invention or application.)

Counsel for complainant also offers in evidence a copy of an assignment from Sawyer and Man aforesaid, to the Electro Dynamic Light Company aforesaid, of the invention covered by the patent in suit, and the same is marked "Complainant's Exhibit Sawyer and Man Assignment of October 14th, 1878, H. D. G., examiner."

Counsel for complainant also offers in evidence a copy of the assignment of Sawyer and Man to the Electro Dynamic Light Company of the patent in suit, and the same is marked "Complainant's Exhibit Sawyer and Man Assignment of January 9th, 1880, H. D. G., examiner."

58 Counsel for complainant also offers in evidence a copy of the assignment of the Electro Dynamic Light Company to William H. Church, trustee, of the patent in suit, and the same is marked "Complainant's Exhibit Electro Dynamic Light Company Assignment of April 6th, 1881, H. D. G., examiner."

Counsel for complainant also offers in evidence a copy of the assignment of William H. Church, trustee, to the Eastern Electric Manufacturing Company of the patent in suit, and the same is marked "Complainant's Exhibit Church Assignment of April 6th, 1881, H. D. G., ex'r."

Counsel for complainant also offers in evidence a copy of the assignment of the Eastern Electric Manufacturing Company to the complainant of the patent in suit, and the same is marked "Complainant's Exhibit Eastern Electric Manufacturing Company Assignment of September 30th, 1882, H. D. G, examiner."

Counsel for complainant also offers a copy of the assignment from William E. Sawyer and Albon Man to the Electro Dynamic Light Company, and the same is marked "Complainant's Exhibit Sawyer and Man Assignment of April 5th, 1881, H. D. G., examiner."

Testimony of Franklin L. Pope.

FRANKLIN L. POPE, being duly sworn on the part of the complainant, testifies in answer to interrogatories by the counsel for complainant, as follows:

Int. 1. State your name, age, residence and occupation.

Ans. Franklin L. Pope; age, 47; Elmora, Union county, New Jersey. I am an electrical engineer and solicitor of patents, and an editor of a technical periodical published in the city of New York under the name of The Electrical Engineer.

Int. 2. What practical experience have you had in connection with electricity?

59 A. I have been employed for thirty years in more or less intimate connection with work having to do with the industrial applications of electricity, and have devoted much time to study and experimentation relating to this work. I have also tried to keep myself well informed as to the progress of electrical science and art, and have read much that has been written on the subject, and published in scientific and technical publications. I have written many articles on these subjects for my own and other technical periodicals, and have many times been called upon to give testimony in the United States courts in suits involving questions of infringement of patents of methods and apparatus for applying electricity in the arts. I have had much experience in designing, constructing and operating electrical and magnetic apparatus of almost every description, and have made a considerable number of inventions in telegraph and fire-alarm apparatus, electric railways and railway signals, electric lighting and the like, some of which have gone into very extended practical use. I was assistant engineer of the American and of the Western Union Telegraph Company; was assistant engineer in charge of the American division of the telegraph line which was projected, and in great part constructed between the United States and Siberia by way of Behring's straits in 1865, and I also constructed and put in operation the first system of distributing stock exchange and market quotations in private offices, which was in New York in 1867. I was for many years employed by the Western Union Telegraph — as an expert to examine for them new inventions and patents, and for the last eight years have been in business in New York city on my own account, as a solicitor of patents and general expert in electrical work.

3 Q. Are you familiar with the complainant's patent?

A. I am.

4 Q. Look at the incandescent electric lamp now shown you, marked "Exhibit Defendant's Lamp," and with the under-

60 standing that it is made in the following manner, namely:

The incandescing conductor is made from bamboo. The bamboo is received by the defendant's vendor in strips about one-sixteenth of an inch thick, one-quarter of an inch wide, and ten or twelve inches long, the strips being cut from the surface of the cane. The hard surface of these strips being removed, they are planed to the desired thickness, and the piece to be used in the lamp is cut from the strip. The ends of the piece to which the leading-in wires are to be attached are made larger than the light-giving part. This piece is bent into a hair-pin shape upon a hot cylinder, and then placed in an air-tight "form" or mold to hold it in its proper shape, and carbonized at a high temperature in a furnace. When taken from the furnace, it is attached to the leading-in wires, and is put in the lamp bulb from which the air is then exhausted. The completed lamp chamber is one made entirely of glass and hermetically sealed by the fusion of the glass around the leading-in wires: Please compare the said lamp with the complainant's patent, and state whether, in your opinion, it embodies the invention set forth and claimed therein.

Ans. I have carefully read the specification and inspected the drawings of the complainant's patent, and believe that I understand the invention described and claimed therein.

I have examined the incandescent lamp shown me, and with the understanding that it was made in the manner described in the question, I believe that I understand its mode of operation and the method and process of its manufacture.

The defendant's lamp is a structure or article of manufacture composed of three essential parts.

First, an enclosing chamber composed wholly of glass, which has been hermetically sealed after the removal of the atmospheric air originally contained therein.

Second, of a light-giving portion which may be termed the illuminant, consisting of a resisting conductor of arch or horseshoe 61 form, made of a fibrous organic substance, brought to the required shape and then carbonized in a retort, or closed vessel.

Third, of connecting or leading wires or conductors electrically connected to the ends of the carbon illuminant, and made to pass air-tight through the walls of the enclosing chamber of glass.

I find that the structure of defendant's lamp, which I have described, contains the same elements, combined in substantially the same way, and organized to operate in the same manner, to produce the same result, as the structure described and claimed in complainant's patent. The specification of the patent in suit sets forth that the invention is an improvement upon an apparatus shown in prior letters patent granted to the same inventors June 18th, 1878 (No. 205,144.) The specification goes on to say:

"Our invention relates more especially to the incandescing conductor, its substance, its form, and its combination with the other elements composing the lamp. Its object is to secure a cheap and effective apparatus, and our improvement consists, first, of the combination in a lamp composed wholly of glass (as described in patent No. 205,144), of an incandescing conductor of carbon made from a vegetable fibrous material, in contradistinction to a similar conductor made from mineral or gas carbon, and also in the form of such conductor so made from such vegetable carbon, and combined in a lighting circuit within the exhausted chamber of the lamp."

Referring back to patent No. 205,144, I find described therein a lamp for giving light by incandescence, in which a straight, thin rod of mineral carbon included in an electric circuit is supported by means of suitable standards in a vertical position within an air-tight chamber, composed wholly of glass, and having leading-in wires passing air-tight through the glass walls of the chamber. This air-tight chamber is charged with an artificial atmosphere, preferably of nitrogen, for the purpose of absolutely exclud-
62 ing oxygen, a gas which would chemically unite with and destroy the illuminant when at a high temperature.

The essential difference which I find to exist between the invention set forth in the present patent and that of the former patent upon which it is stated to be an improvement, relates, as the specification points out, to the substance and to the form of the incandescing conductor or illuminant, and it consists, according to the statement of the patentees, in the combination with an all-glass lamp chamber "of an incandescing conductor of carbon made from a vegetable fibrous material, in contradistinction to a similar conductor made from mineral or gas carbon, and also in the form of such conductor so made from such vegetable carbon, and combined in the lighting circuit within the exhausted chamber of the lamp."

Hence the improvement in the illuminant is twofold, as it relates to its form, and also to its substance.

Referring first to the form, the carbon illuminant of the patent in suit, is of what is termed by the patentees an "arch" form, as generically distinguished from the straight form of the corresponding part in the former patent. One objection to the straight illuminant arises from the fact that the wires leading from the source of electrical supply are conveniently, and almost necessarily brought to the lamp in a direction parallel to each other; hence it becomes necessary with a straight vertical illuminant, such as that of the former patent, to carry one of the opaque and non-luminous leading-in conductors to the upper end of the carbon and past its luminous portion, which cannot be done without casting a dense shadow in at least one direction, which, for obvious reasons, is objectionable. This objection is avoided by the use of the arch-shaped carbon, as pointed out at lines 9–13, of page 2, of the specification of complainant's patent. A second advantage of this form is that the expansion and contraction of the carbon necessarily arising from the extreme variations of temperature to which it is subjected, are com-
63 pensated for in the arch itself, and this without the necessity of altering the position of the terminal supports, or of providing any special devices or means for adjustment, such as were necessary in the earlier form of lamp described in patent No. 205,144. This feature is referred to in the specification, beginning at line 100 of page 1. A third advantage, which is quite important in practice, although not mentioned by the patentees, is that by thus doubling the incandescent conductor back upon itself in the form of an arch or loop, a much greater length can be placed within a glass globe or bulb of the form and dimensions usually preferred for lamps, than would be possible in case a straight carbon were

used; and a fourth advantage, also not referred to by the patentees, is that the diffusion or distribution of the light through the space to be illuminated is more uniform with an arch-shaped than with a straight illuminant, especially when the arch is placed in an inverted position.

Referring, second, to the substance of the illuminant, the specification explains that this is formed of organic as distinguished from inorganic carbon. Inorganic carbon, of which the so-called mineral or gas carbon is an example, consists of an aggregation of minute particles of carbon, which adhere together in dense and extremely hard masses. This substance can only be worked into shape with extreme difficulty and labor, and is harder and more inflexible and brittle even than glass. Organic carbon, on the contrary, is of a cellular or fibrous character, is comparatively soft, and by proper manufacture may be made extremely flexible, elastic and tough. By the employment of the last-named species of carbon several important advantages are secured. Some of these advantages are mentioned on page 2, line 21, of the specification as follows:

"The advantage resulting from the manufacture of the carbon from vegetable fibrous or textile material, instead of mineral or gas
carbon, are many. Among them may be mentioned the con-
64 venience afforded for cutting and making the conductor in
the desired form and size, the purity and equality of the carbon obtained, its susceptibility to tempering, both as to hardness and resistance, and its toughness and durability."

Moreover, the illuminant may be partially or wholly shaped before carbonizing. This method of procedure, which is referred to on page 1, lines 91–94, permits, first, of a selection of the proper material for producing carbon of uniformly good quality; second, of shaping the same so as to admit of more uniform and complete carbonization than would otherwise be possible; third, of shaping the same with economy and convenience; fourth, of giving to the illuminant, while in the process of manufacture, a predetermined resistance to the electric current, by varying its length, cross-section and density, whereby it can be adapted to any required system of electrical distribution; and fifth, it preserves the organic form and structure of the original blank, thereby conferring upon the illuminant great toughness and durability.

The patent, as I understand it, sets forth both a discovery and an invention. The discovery is that structural or organic carbon possesses an inherent adaptation to the peculiar requirements of incandescent lighting, and the invention consists in endowing such carbon with certain valuable properties and a better form, and in combining the same with other elements already known, but which were necessary to constitute a practical incandescent lamp for lighting by electricity.

I will now compare the structure of the defendant's lamp with the several claims of the patent. The first claim is as follows:

"An incandescing conductor for an electric lamp, of carbonized fibrous or textile material, and of an arch or horseshoe shape, substantially as hereinbefore set forth."

65 I understand this claim to be for what may be termed an article of manufacture, to wit, an incandescing conductor of fibrous or textile material for an electric lamp, and of an arch shape—that is to say, the conductor claimed must be of a certain material, and also of a certain form.

The defendant's lamp contains an incandescing conductor of a fibrous material, to wit, bamboo cane, which is first shaped and then carbonized, and afterwards mounted in the lamp in the form of an arch or horseshoe. The incandescing conductor or illuminant of defendant's lamp is, therefore, composed of the material, and has the same shape as that claimed in the first claim, and it possesses all the advantages I have mentioned as arising therefrom.

The second claim is as follows:

"The combination, substantially as hereinbefore set forth, of an electric circuit and an incandescing conductor of carbonized fibrous material, included in and forming part of said circuit, and a transpatent hermetically sealed chamber in which the conductor is enclosed."

I understand this claim to be for a combination of an incandescing conductor of the material specified, being the same as the material of the first claim, but irrespective of its form, in combination with an electric circuit in which it is included, and a transparent hermetically sealed chamber within which it is enclosed, which chamber I find by reference to the specification is one from which carbon-consuming gases are excluded.

I find all the elements of this combination present in the defendant's lamp when the same is in operation; the structure, combination and mode of operation being substantially the same. In this lamp the air which contains oxygen, a carbon-consuming gas is excluded, having been withdrawn by the exhaustion of the globe.

The third claim is as follows:

"The incandescing conductor for an electric lamp, formed of carbonized paper, substantially as described."

66 I understand this claim to be for an incandescing conductor, not of carbonized fibrous or textile material generally, but of a specific variety of such material, namely, paper. Assuming the patentees to use the term "paper" in a generic sense, it might be held to mean vegetable fiber in thin flat sheets, however produced; whether by the ordinary and well-known process of paper-making, or by shaving with an edge tool from a mass of wood as for example, in the case of the material commercially known as wood-paper hangings. In my judgement the bamboo or endogenous wood from which the defendant's carbon is made, can hardly be considered to properly fall within the class of material apparently intended by the patentees to be covered by this claim.

It might be contended that, inasmuch as the actual material is the same, that is to say, interlaced vegetable fiber, and that this is reduced to thin flat sheets or plates, in one or more directions before carbonizing, it would, in view of the state of the art, and assuming the patentees to be the first to use organic material in any form reduced to such thin sheets or plates, constitute a substantial equivalent, especially as such thin sheets had already been used in the industrial arts as an equivalent for paper for some purposes; but on the whole I am inclined to the opinion that the patentees designed to limit the scope of this claim to the specific article of paper in the common acceptation of the term, that is to say, thin sheets made from macerated vegetable pulp, pressed and dried.

The fourth claim is as follows:

"An incandescing electric lamp consisting of the following elements in combination: First, an illuminating chamber made wholly of glass hermetically sealed, and out of which all carbon-consuming gas has been exhausted or driven; second, an electric circuit conductor passing through the glass wall of said chamber and hermetically sealed therein, as described; third, an illuminating conductor in said circuit, and forming part thereof within said
67 chamber, consisting of carbon made from a fibrous or textile material, having the form of an arch or loop, substantially as described, for the purpose specified."

I find all the elements of this claim present in the structure of the defendants, namely: First, an illuminating chamber made wholly of glass and hermetically sealed, out of which all carbon-consuming gas, that is to say, oxygen, has been exhausted; second, a circuit conductor passing through and hermetically sealed into the glass wall of the chamber; and third, the incandescent or illuminating conductor consisting of carbon made from a fibrous or textile material, and in the form of an arch or loop.

My opinion, therefore, is that the defendant's lamp contains the invention set forth in the specification and claimed in the first, second, and fourth claims of the patent in suit.

Counsel for complainant offers in evidence the lamp shown to the witness in connection with the fourth interrogatory, and referred to throughout the testimony as "Complainant's Exhibit Defendant's Lamp, H. D. G., examiner," and it is so labeled by the examiner.

Counsel for defendant admits that the lamp offered in evidence by complainant, and marked "Complainant's Exhibit Defendant's Lamp," is a type of the lamps in use by the defendant, and is made substantially as described in the assumption of complainant's counsel in Int. No. 4.

Cross-examination of FRANKLIN L. POPE by J. C. TOMLINSON, Esq., counsel for defendant:

5 X Q. In your answer to question 4, you say the defendant's lamp consists of three essential parts, first, an enclosing chamber composed wholly of glass, which has been hermetically sealed after the removal of the atmospheric air originally contained therein. Please look at defendant's lamp, and tell me whether the following is a correct description of its structure: The lamp consists of
68 what may be called two parts, one part consisting of an enclosing globe or bulb made entirely of glass; the other part

consisting of an incandescing conductor and wires to which it is attached in the interior glass portion. The inside part contains a filament of carbon first united mechanically and then electro-plated to two small platinum wires. These platinum wires pass through the glass, the glass being sealed around the wires by the fusion of the glass. The inside part is then inserted in the glass bulb and a seal is made by hermetically sealing the glass bulb and the glass of the inside part by fusion of the glass; the lamp as an entirety being now complete, the air is exhausted from the top of the bulb where the "tit" is, and which previously was an open tube, and after being exhausted a hermetical seal is made at this point by the fusion of the glass.

Ans. I think your question correctly describes the structure of the lamp and the manner in which its parts are assembled together. I am unable to determine from any inspection of the exhibit whether the ends of the incandescing conductor are united to the leading-in wires by the process specifically mentioned, namely, electro-plating. They are, however, united in some manner which ensures a good conducting electrical connection between the incandescing conductor and the leading-in wires.

X Int. 6. Is it not true that the completed lamp chamber of defendant's lamp is composed entirely of glass, except only where the platinum wires pass through the glass, around which the glass is fused?

Ans. Yes.

X Int. 7. At what point or points in defendant's lamp is there any danger of leakage, if at all?

Ans. There is practically no danger of leakage except at the points where the leading-in wires pass through the walls of the chamber.

X Int. 8. Do you know why at this point platinum wires are used?

69 A. Doubtless for the reason that the co-efficient of expansion by variations of temperature is very nearly the same in platinum and in glass. If I am rightly informed, platinum more closely approaches glass in this respect than any other metal.

9 X Q. Have I a correct understanding that these platinum wires are very small, and that the glass is fused around them?

A. Yes. I should say the thickness of the wire in the "Exhibit Defendant's Lamp" would not exceed four or five thousandths of an inch, and the glass is sealed around it by fusion for a length of something like one-quarter of an inch.

10 X Q. What is the electrical resistance of defendant's lamp?

A. This cannot be determined except approximately from its appearance; somewhat more than two hundred ohms when cold, a little more than half the cold resistance when heated would perhaps be a fair approximation.

11 X Q. Is not defendant's lamp intended to maintain a high vacuum?

A. Yes.

12 X Q. What is the length of the conductor that becomes incandescent in the defendant's lamp?

A. I should judge about six inches.

13 X Q. In your fourth answer, when speaking of the patent in suit, you refer to letters patent No. 205,144, granted to Sawyer and Man, and say the points of difference between the patent in suit and the patent No. 205,144, consist in the substance and form of the conductor which in the patent in suit is of a fibrous origin and in the arch form, whereas, in the former patent, the conductor was straight and of non-fibrous carbon. When the patent in suit speaks
of the lamp being made "wholly of glass," do you under-
70 stand that it refers to such a lamp as shown in the patent in
suit, and in the patent No. 205,144 as wholly of glass, in the
sense of these patents?

Ans. I do not understand the meaning of the expression to be restricted to a chamber made wholly of glass and made in the precise form and in the particular manner that is described in patents No. 205,144 and in the patent in suit, but to refer in general to a lamp chamber made wholly of glass of which the construction shown in these two patents is one example.

X Int. 14. Do you understand the construction shown in patent No. 205,144?

Ans. I think so.

X Int. 15. The patent in suit between lines 20–25, page 1, says, "Our improvements consist, first, of the combination in a lamp chamber composed wholly of glass, as described in patent No. 205,144, of an incandescing conductor, &c." Do you understand from this statement that the inventors regarded the lamp chamber of patent No. 205,144, as composed wholly of glass?

Ans. Apparently they did so regard it.

X Int. 16. Do you so regard it?

Ans. Yes.

X Int. 17. Do you think it is composed wholly of glass in the sense in which defendant's lamp is composed wholly of glass?

Ans. I think so, inasmuch as in both structures the chamber is composed wholly of glass, except as to the openings through the walls, which are filled with the substance of the leading-in wires. In the ordinary use of language both chambers may, in my opinion, be regarded as being wholly of glass.

X Int. 18. Do you know where the terms or words "wholly of glass," as applied to incandescent lamps had their first expression in the art?

Ans. I do not.

71 19 X Q. Or as to what style of construction they were first
applied?

A. I do not.

20 X Q. You give them then their popular meaning, and any lamp chamber which in a general sense was wholly of glass would be within the meaning of those terms?

A. I should hardly give it quite so broad a signification as that. The meaning the expression conveys to my mind is a chamber which is wholly of glass except in so far as is necessary to convey an electric current into the chamber and out again by means of the metallic conductors.

21 X Q. Must the chamber be of one continuous piece of glass to be wholly of glass within your understanding of the words, or would a glass dome resting on a glass base, there being an artificial cement between the dome and the base, constitute a chamber composed wholly of glass within your understanding of those words?

A. I think such a chamber as you have described may properly be regarded as a chamber wholly of glass.

22 X Q. Would the thickness of the cement have anything to do with it?

A. I do not see that it would.

23 X Q. You say you understand the construction of patent No. 205,144?

A. I think so.

24 X Q. Is there anything in patent No. 205,144 which describes the chamber as being made wholly of glass?

A. I do not think the patent contains any specific statement to that effect in so many words. It does, however, describe a glass globe fitted and ground air-tight to a glass base, the joint being, as the patentees state, slightly coated with fir-balsam, or some cement, when being put together. It is also stated that two holes are drilled through the base, into which metallic tubes are fitted, through which the conductors pass, and these tubes electrically
form a part of the conductor. Such a structure is, in *of the*
72 *conductor. Such a structure is, in* my opinion, properly de-
scribed as a chamber composed wholly of glass.

X Int. 25. The glass dome of the lamp of patent No. 205,144 is, as I understand, placed upon a glass base, and the two united together by a cement and further held by pressure; am I correct?

Ans. I do not understand that the parts are, strictly speaking, united by a cement. They are held together by a mechanical clamping device, and the function of the cement is solely to prevent leakage. That is to say, if the parts fitted each other with absolute accuracy the action of the clamps would be sufficient to maintain the union between the parts, and the employment of any intervening substance would be wholly unnecessary. The patentees state that the fir-balsam or cement is used "in order the better to insure that hermetical sealing which is indispensable to the preservation of the incandescent conductor." I do not find any other function suggested.

X Int. 26. Would such a structure as is here shown preserve such a vacuum as is required to be preserved in defendant's lamp?

Ans. I think it doubtful if so high a vacuum could be preserved with that particular structure.

X Int. 27. In patent No. 205,144 the conductors "J" "K" are made hollow, are they not?

Ans. Yes.

X Int. 28. They pass through bolts, which bolts in turn pass through the glass plate forming the base of the lamp, do they not?

Ans. Yes.

X Int. 29. Would the structure at these points preserve such a vacuum as is necessary to be preserved in defendant's lamp?

Ans. Probably not; that is, not a high vacuum.

X Int. 30. There are, then, four points of danger of leakage in this lamp; first, where the glass dome rests on the glass
73 base; second, where the bolts pass through the glass base; third, where the tubes pass through the metallic bolts; and fourth, the point outside where the tubes can be connected with the apparatus to charge the lamp with the artificial atmosphere?

A. Yes, such would be the case if constructed in accordance with the drawings.

31 X Q. Is there anything to indicate in this patent that the tubes are made of a material having the same or approximately the same co-efficient of expansion and contraction as the glass?

A. I think not. It is apparently left entirely to the discretion of the constructor as to what metal he would use.

32 X Q. Would this structure, as a whole, preserve such a vacuum as is required to be preserved in defendant's lamp?

A. It undoubtedly would be insufficient to preserve such a high vacuum as that which is actually used in defendant's lamp.

33 X Q. What do you understand to be the object of the lumps of sodium or potassium marked respectively "R" and "S," and shown in this drawing?

A. The patentees state that these are placed in the chamber by preference as a safeguard against an infinitesimal leakage. These substances have a great affinity for oxygen, and the evident intention of the patentees was to have these substances in the lamp, so that in case any small amount of oxygen should penetrate the lamp chamber it would be absorbed, and not brought in contact with the carbon.

34 X Q. This would rather look as though they expected what they call an infinitesimal leakage, would it not?

A. It shows that they contemplated the possibility of it.

35 X Q. Do you not think their contemplation was justified?

74 Ans. Yes; I think it might be fairly assumed that it was.

X Int. 36. What do you understand to be the object of the soapstone disc "C" in this lamp?

Ans. It appears to have been to obstruct the radiation of heat from the illuminant towards the base of the lamp, and thus to prevent the metallic parts at the base from being too much heated.

X Int. 37. Why were the conductors "J" and "K" made so long?

(Before any further examination in regard to patent No. 205,144, it is objected to by counsel for complainant as incompetent and immaterial.)

Ans. Apparently for the purpose of increasing the distance between the illuminant and the base of the lamp.

X Int. 38. I do not know that I understand you: how increase the distance?

Ans. The longer the conductors are the higher the illuminant which is supported upon them is raised above the base.

X Int. 39. That I understand, but these conductors are made fluted, so as to have a greater length than would be required to place the illuminant at the point above the base of the lamp which it occupies. What I intended to ask was, why this length of conductor is employed?

Ans. Apparently for the purpose of increasing the radiating surface, so that a less amount of heat is conducted to the base, or a less amount of heat reaches the base by transmission through the conductors.

X Int. 40. Now, if this structure would have maintained the atmospheric conditions the inventors desired, the soapstone disc and the fluted conductors would have been unnecessary, would they not?

Ans. Perhaps so. The type of lamp shown is calculated to generate a great amount of heat while in operation, and this
75 might be sufficient to cause fractures from unequal expansion
of the glass of the chamber itself when of the configuration shown in the drawing, but it is explained in the specification that the object of the soapstone diaphragm was to prevent leakage which might arise from expansion of the parts surrounding in joints, and the spiral arrangement of the conductors was also designed to aid in bringing about this result.

41 X Q. The presence of these structures, then, would indicate that the inventors did not consider that their lamp without them would maintain the atmospheric conditions desired.

A. They were evidently added as safeguards against a difficulty which they spprehended might arise. It is not perhaps necessary to infer that they considered them absolutely indispensable.

42 X Q. They of course added to the expense of the construction?

A. Undoubtedly.

43 X Q. Do you understand from this patent that the lamp was to contain an artificial atmosphere at atmospheric pressure.

A. The patentees state that the atmospheric air is to be expelled from the globe or chamber and its place supplied by an artificial atmosphere. I think it is not distinctly stated whether this artificial atmosphere is to be maintained at the same pressure as that of the external air, but I infer that such is the design.

44 X Q. It is stated in the patent that "a perfect vacuum is unattainable." If at the time this application was filed this was the best construction the patentees had been able to get, should you not think then that they were quite justified in their statement?

A. I think the statement is justified in any event, for so far as we yet know it is literally true.

76 45 X Q. For all practical purposes at the present time *time*
a perfect vacuum is obtained and preserved in such a lamp as defendant's, is it not?

Ans. For practical purposes, yes.

X Int. 46. Now, if at the time of the application for this patent No. 205,144, the structure shown was the best the patentee had been able to get, should you not think that for all practical purposes of incandescent lighting they were justified in their statement that a perfect vacuum is unattainable?

Ans. I should regard it as quite doubtful whether a perfect vacuum could be maintained in a chamber having the construction described and shown in this patent, but I am not willing to go so far as to say that it is impossible.

X Int. 47. What should you say was the resistance of the incandescent conductor of the lamp of patent No. 205,144?

Ans. I could not say; possibly one ohm or something like that.

X Int. 48. Turning now to the patent in suit, what do you regard the invention of the first claim of the patent to be?

Ans. In my opinion it is what is technically known as an article of manufacture, namely, an incandescing conductor, for an electric lamp, of a specific material and of a particular form, the material being fibrous or textile material which has been carbonized in such a manner as to confer upon it certain properties and to which has been given an arch or horseshoe shape.

X Int. 49. I do not know as I understand what you mean by saying that the material has been so carbonized as to confer upon it certain properties. Suppose you had an arch-shaped conductor made of fibrous carbon which had not been so carbonized as to confer upon it what you mean by certain properties, would it be within the invention of the claim?

Ans. As I understand it, the carbonization must have
77 been effected in such manner as to confer upon the material
the properties set forth in the specification as tending to increase its usefulness as an incandescing conductor. These qualities are particularly mentioned in the specification, lines 24–30, as follows: "Among them may be mentioned the convenience afforded for cutting and making the conductor in the desired form and size, the purity and quality of the carbon obtained, its susceptibility to tempering both as to hardness and resistance, and its toughness and durability." It is possible to carbonize fibrous or textile material or at least to convert it into a form of carbon which does not possess these properties or any of them to a useful extent, and such material would not, in my judgment, be within the meaning of the terms of the claim.

50 X Q. In order, then, to predicate infringement of the claim you would have to know something more than whether the conductor alleged to infringe was of carbonized fibrous or textile material, and of an arch or horseshoe shape?

A. It would only be necessary to know, in addition to this, that it possessed the properties or some of the properties which are mentioned in the specification, and which reference I have quoted in my last answer. The presence of some of these properties can be determined without difficulty by a mere inspection of the lamp.

51 X Q. That may all be, but as I understand you, the possession of these properties, or some of them must be present to constitute infringement?

A. Yes, I so understand it.

52 X Q. Now, as this may become very important, what are the

properties specifically, in your judgment, that must be possessed to predicate infringement?

A. The carbon must, in the first place, have been made from fibrous or textile material. This must have been carbonized in such a manner as to preserve the organic structure of the material, 78 and thereby to possess qualities of tenacity or toughness and durability. The quality of durability implies that it should have a certain degree of flexibility and elasticity, or rather resilience. This quality also implies a certain purity and uniformity of the structure of the carbon throughout. There may be other qualities desirable, but those I have mentioned appear to be essential.

X Int. 53. The possession or absence of these properties depends entirely upon whether the material has been properly carbonized, does it not?

Ans. Yes; they can only be obtained, so far as my present knowledge extends, by carbonizing the material in a retort, or similar vessel, from which air is excluded.

X Int. 54. It comes down to this, then, if I understand you correctly: To infringe this claim the conductor must have been made from fibrous material, be of an arch shape, and have been properly carbonized?

Ans. Yes; I think that expresses it.

X Int. 55. To have the conductor of the fibrous or textile material, and of an arch form which has been properly carbonized so as to come within what you understand to be the invention of this claim, what is necessary to be done to insure such carbonization, in your judgment?

Ans. It is necessary to shape the material either wholly or in part; that is to say, to shape it in at least one of its dimensions, namely, breadth or thickness, before carbonizing, and to carbonize it by heat in a closed retort or similar vessel to which the air cannot have access during the process of carbonization.

X Int. 56. Do we then get down to this: That to predicate infringement of this claim you must not only have a conductor of carbonized fibrous or textile material, and of an arch form, but in carbonizing the material it must have been cut to size in at least one of its dimensions before carbonization, and carbonized in a closed retort, or similar vessel, from which air is excluded?

79 Ans. I am not willing to assent exactly to that statement. The invention, as I have said, is, in my opinion, an article of manufacture made from certain raw material and possessing certain properties or qualities. So far as I am aware, these properties or qualities can only be conferred upon the material by first shaping it in at least one of its dimensions, and afterwards carbonizing it in a closed vessel; but should any process be hereafter discovered by which the same raw material can be treated so as to endow it with the same qualities, the manufactured article would, in my judgment, still be that of the claim.

57 X Q. You regard the claim then as practically covering a conclusion. In other words, you may get the article of manufacture of the claim, to wit, an in*ca*ndescent conductor of carbonized fibrous

or textile material, and of an arch or horseshoe shape, but such article may or may not infringe, according as it does or does not possess certain qualities.

A. It is a conclusion in the sense that any completed manufactured article may be the conclusion of a process consisting of successive steps, and it would not be infringed by an article which did not possess any of the essential qualities such as those mentioned in the specification, in which its peculiar value for the purposes for which it is to be used resides.

58 X Q. Don't you regard your position as taking an extremely novel view of a claim or invention?

A. I do not know that it is. I am not aware that the novelty of qualities found in an article of manufacture is necessarily dependent upon the process employed in producing it. Of course such may be the case, but it is not necessarily the case.

59 X Q. The trouble is that the claim is not for a process, but, as you say, for an article, and it seems to me extremely novel to say that while you may get the article of the claim, you cannot say whether you have got the invention of the claim until you know whether the article has or has not certain properties. This would make an infringement depend upon the skill of the infringer. If he did his work well he would infringe; if he did his work poorly he would not, and yet in each case you have the same article. Isn't that a novel position?

Ans. I do not consider it the same article unless it has substantially the same properties with reference to the purpose for which it is to be used, and so long as it has those properties I am unable to see how it is material by what process the properties are conferred upon the article, so long as there is some process, either well known or pointed out in the specification which will answer the purpose.

X Int. 60. Here we have defendant's lamp, which you say infringes. Suppose I should bring you another lamp exactly like this, excepting that the carbon filament had been improperly carbonized. Would this second lamp infringe the claim of the patent?

Ans. If the second lamp possessed the qualities pointed out in the specification which I enumerated in my answer to Int. 48 I think it certainly would infringe. If the filament had been carbonized in such a way that its organic structure was destroyed, and it was rendered inelastic and brittle, as, for example, like mineral or gas carbon, then it would not be an infringement.

X Int. 61. Your definition of the claim seems to open the door to a question of degree. An infringement must depend, as you say, not upon the article itself, but upon the possession by that article of certain properties. At one end of the line there would be a clear case of infringement; at the other there would be none. Can you point out what you would call the dividing line, and say just when infringement would be present and when it would not?

Ans. It does not appear to me that there is any real difficulty in practice in drawing a distinction between organic material which

has been carbonized in such a manner as to preserve its
81 organic structure, its elasticity, flexibility and toughness, and material which has been carbonized in such a way that these properties have been destroyed, and this, it seems to me, is the real distinction. The claim evidently contemplates an incandescing conductor possessing qualities which render it useful as an element of an electric lamp. If a conductor was formed of fibrous material and carbonized in the open air, or in such a manner that the air had partial access to it, it would be soft and friable, entirely inelastic and utterly useless for the purpose contemplated by the patentees. Such an article, obviously, would not be the one to which the claim is designed to refer.

62 X Q. Do you attach any special meaning to the words "substantially as hereinbefore set forth" in the claim?

A. They are intended to refer, of course, to the description in the specification, but I consider that such reference would be implied even if these words were not present. They have no other meaning to my mind.

63 X Q. Which of the elements of the second claim do you regard as new at the time the application was filed?

A. I am not certain that any of the elements are new.

64 X Q. Is the combination new?

A. So far as I know it was new at the date when this invention is alleged to have been made.

65 X Q. I did not ask that. What I would like to know is if you consider the combination new at the time the application was filed.

A. If I recollect right, the combination had been described in a printed publication prior to the date on which the application purports to have been filed. That is to say, January 9th, 1880.

66 X Q. Had the invention of the first claim also been described in a printed publication prior to that time?

A. I think it had.

82 X Int. 67. Had the invention of the third claim been described in a printed publication prior to that time?

Ans. I think so.

X Int. 68. And of the fourth?

Ans. I think so.

X Int. 69. To what publication are you referring?

(Objected to as incompetent and as not being cross-examination.)

Ans. The publication which I have in mind is the "New York Herald."

X Int. 70. Carbonized fibrous material had been used as an incandescent conductor for an electric lamp long anterior to the application for the patent in suit, had it not? There were many patents and publications showing and describing lamps in which the conductor was stated to have been of carbonized fibrous material?

(Objected to as incompetent.)

Ans. I do not know about the use. There were publications, and possibly patents, in which charcoal was described as the incandescing conductor, and charcoal, broadly speaking, is cabonized fibrous material.

X Int. 71. There were numerous patents and publications in which incandescent lamps were shown having arch or horseshoe shaped conductors, were there not, long prior to the application for the patent in suit?

(Objection repeated.)

Ans. I think there were one or more instances of the use of a conductor which might be regarded as of an arch or horseshoe shape anterior to the date of the application for the complainant's patent.

X Int. 72. Do you know whether any patents or publications long anterior to the application for the patent in suit described cutting fibrous material to the size desired, and carbonizing it after being so cut for use in electric lamps?

(Objection repeated.)

83 A. I do not recall any such instance.

73 X Q. Was it not well known long prior to the application for the patent in suit how to carbonize fibrous or teztile material, and had not such material been carbonized repeatedly, and descriptions published of the way it had been carbonized, so that the material after carbonization would possess the properties pointed out in the patent in suit?

A. Certainly; all this was well known in the arts.

74 X Q. Had you any connection with the application for the patent in suit, or were you consulted in any way in regard to it?

A. I had no connection with it, but I think I was once consulted about it. I recognize the drawing which forms the first sheet of the illustrations accompanying the patent in suit as having been shown me several years ago. I did not, however, read the specification, nor was I made acquainted with its contents.

75 X Q. Have you read recently, and are you famillliar with the original application for the patent in suit?

Objected to as incompetent and as not being cross-examination.

A. I have read a copy of it once since the patent was issued, but cannot say that I am at all familiar with it as distinguished from the specification as issued.

76 X Q. I show you what purports to be a copy of the specification and claims as originally filed. Do you find anything in this specification to indicate a preference on the part of the inventors for fibrous or non-fibrous carbon?

Counsel for complainant objects to the question as not cross-examination, and therefore incompetent, and this objection is now entered to any further questions which may be asked relating to the application, or to the file-wrapper and contents of the patent in suit.

A. The first and second claims refer to incandescing arcs 84 (meaning, I suppose, incandescing curved illuminating conductors) of carbon, broadly, while the third claim includes, as one of its elements, an incandescing arc of carbonized paper. This would seem to indicate a preference for the fibrous material for practical purposes, inasmuch as it is the specific form which is preferred to be claimed in connection with the gerneric form.

X Int. 77. Any preference that they might have then for fibrous or non-fibrous material is left to be inferred and is not expressed?

Ans. No express statement of preference occurs in the specification, so far as I observe.

X Int 78. Does this original specification point out or suggest any advantages that would be possessed by fibrous over non-fibrous carbon?

Ans. I think not.

X Int. 79. In the specification it is stated "we have tried carbonized paper covered with powdered plumbago." What do you understand such statement to mean?

Ans. It means to my mind exactly what it says, that carbonized papĕr had been used by the patentees in the combination which they describe.

X Int. 80. What meaning do you attach to the words "covered with powdered plumbago" as connected with the statement of the use of carbonized paper?

Ans. Its most obvious meaning is that powdered plumbago had been applied to the surface of the paper after carbonization. It may possibly mean that paper covered with powdered plumbago had been carbonized. I think the first is the most probable meaning of it.

X Int. 81. Or, in other words, that what they tried was not pure carbonized paper, but a composit conductor of paper covered with plumbago?

Ans. The passage appears to mean a combination of carbonized paper and powdered plumbago. Whether the plumbago is applied before or after carbonization, or both, does not appear to be clear.

85 82 X Q. What advantages does this original specification point out as being possessed by the arch form?

A. I do not find that anything is mentioned beyond the fact that the shadow cast by the arched burner is less than that produced by other forms of burners, referring, I presume, to such an arrangement of the burner as that shown in patent No. 205,144, upon which this invention professes to be an improvement.

83 X Q. Bearing in mind that patent No. 205,144 contemplated the use, as you think, of an inert atmosphere at atmospheric pressure, do you find anything in this original application for the patent in suit to suggest that the lamp contemplated in this original application was to have anything but an inert atmosphere at atmospheric pressure?

A. The specification says "we have used such burners in close transparent chambers, in a vacuum, in nitrogen gas, and in hydrogen gas, but have attained the best results in the vacuum, or attenuated atmosphere of nitrogen, the great desideratum being to exclude oxygen from the combustion chamber, as is well understood." This appears to distinctly imply that the desideratum being to exclude oxygen from the chamber this might be effected in different ways mentioned, preference being expressed for either a vacuum or an attenuated atmosphere of nitrogen. The plain meaning of the statement is that either the nitrogen atmosphere or a vacuum may be used, according to the convenient or preference of the constructor.

84 X Q. Bearing in mind patent No. 205,144, and reading this original application, and considering the drawing of the lamp which I now show you, what should you say the resistance of this lamp was? (Drawing of the patent in suit shown witness.)

A. It is difficult to say exactly, because so much depends upon the density and consequent conducting power of the carbon. Assuming figures 3 and 4 to be drawn to the actual size of the
86 carbon, I should imagine the actual resistance of the incandescing conductor would be about one ohm, possibly somewhat less than that. I assume, of course, that the carbon is of the ordinary quality of fibrous carbon.

X Int. 85. Suppose this conductor were of hard carbon, what would its resistance be?

Ans. It would be considerably less; perhaps not more than half as much.

X Int. 86. It would be about half an ohm, you would think?

Ans. Say half an ohm or less.

X Int. 87. In this lamp, as I understand, we have the soapstone disc, the fluted conductors, and the same general construction of the lamp base as is shown in patent No. 205,144?

Ans. Nothing is said about the soapstone disc, although the reference to the former patent 205,144 might raise a presumption that it was intended to be used.

X Int. 88. There are the same fluted conductors, are there not?

Ans. Yes.

X Int. 89. And the same general construction of the lamp base?

Ans. Yes.

X Int. 90. Is it your opinion that the lamp, as shown in the drawings of this patent as explained by the original specification, and the reference to patent No. 205,144 would be practically operative as an incandescent lamp?

Ans. I think so.

X Int. 91. Capable of use commercially?

Ans. I see no reason why it should not.

X Int. 92. Do you think it would maintain a vacuum under conditions of actual use?

Ans. As I have before said I think it doubtful if it would maintain a high vacuum for any great length of time. I see no reason, however, why, if carefully made and filled with nitrogen at or
87 somewhat less than atmospheric pressure, it might not operate successfully for a considerable length of time.

93 X Q. You would prefer then the atmosphere of nitrogen to an attempt at a vacuum in such a lamp?

A. Speaking from my general knowledge and in the absence of experimental knowledge, I should say that with the precise mechanical construction shown the best results would be obtained with a nitrogen atmosphere.

94 X Q. Suppose you had a thousand of these lamps, bearing in mind that they would have a resistance of about one ohm each, arranged in multiple-arc circuit and a quarter of a mile from the point where the current that supplied them was generated, what, approximately, would be the size of the conductors running from the scource of electrical supply to the lamps?

A. Under the conditions of distribution assumed, it would be very absurd to make the incandescent conductor of the size and shape shown in the drawings, but assuming that this were done, the conductors leading from the scource of supply to the lamps would necessarily have to be very large.

95 X Q. In order that we may get at some idea of their size, suppose these conductors to be of copper, what should you say their diameter would have to be? I, of course, understand that any answer you may make to this would be only approximate.

A. They would need to be very large; possibly 4 or 5 inches in diameter.

96 X Q. As a practical question, considering the cost of installation, such an installation would be absurd, would it not?

A. Of course it would be utterly absurd. If there were any reason why the constructor should be confined to the precise length and section of an incandescent conductor shown in the drawings of the
patent, he would get a much better result by placing his
88 thousand lamps in series, in which case a conductor large
enough for one lamp would be large enough for all.

X Int. 97. Well, now, we will suppose you arrange your thousand lamps in series, the resistance of each lamp being an ohm. Do you think that would be a practical installation?

Ans. Certainly it would.

X Int. 98. You would have to have in this case a current of much greater pressure, or electro-motive force, than in the other, would you not?

Ans Certainly.

X Int. 99. What would have to be the electro-motive force or pressure of your current for such an installation?

Ans. Perhaps it might be something like 1,000 volts.

X Int. 100. If you are to arrange such lamps as these in series, is it not an advantage to have the resistance as low as possible?

Ans. Yes.

X Int. 101. As you increase the electro-motive force coming to such lamps as these, do you increase the chances of destruction of the lamp, or lessen its light?

Ans. No, because the difference of potential between the terminals of any individual lamp is no greater when 1,000 lamps are in series than with any less number. Increasing the pressure in proportion to the number of lamps in series increases the electric strain on the generator, but not on the individual lamps.

X Int. 102. Your first lamp in such an installation would have a resistance of one ohm in the conductor and a current of an electromotive force of 1,000 volts passing through it, would it not?

Ans. Yes.

X Int. 103. Don't you think that would destroy the lamps, such lamps as shown in this patent?

Ans. No, because the same current passes through the other
89 999 lamps also, and the combined resistance of these diminishes the current, so that the actual strength of the current passing through any one lamp and the actual difference of potential between the terminals of any one lamp is the same, irrespective of the number of lamps in the circuit.

104 X Q. Do you think incandescent lighting would have come into practical use if the art had never gone further than such a lamp as shown in this patent?

A. Not into anything like the universal use that it is at present, but nevertheless, such a system as I have referred to, namely, a large number of lamps of low resistance placed in series in a single circuit has many elements of utility, and would have found extended practical application. Substantially the same principle is now coming into use in many places for street lighting by incandescence.

105 X Q. What form of arrangement, multiple arc of series, would you consider best adapted for a lamp of the kind shown in this patent?

A. For a lamp of the particular dimensions shown in this patent, the series system, but I consider that it would be the same kind of a lamp if the length of its illuminant were increased, and its cross-section diminished so as to increase its resistance. An incandescent lamp is like a telegraph instrument or any other translating device. Its resistance is made greater or less according to the system of distribution or strength of current in which it is designed to be operated.

106 X Q. Was it not old at the time the application for the patent in suit was filed, to enclose an incandescent conductor in a transparent, hermetically sealed chamber?

A. Yes; such an organization had been described in printed publications prior to that date.

107 X Q. Was not this construction also old at the date of the application for the patent in suit: an electric lamp consisting of an illuminating chamber made wholly of glass hermetically
90 sealed, and out of which all carbon-consuming gas had been exhausted or driven, an electric circuit conductor passing through the glass wall of such chamber and hermetically sealed therein, and an illuminating conductor in such circuit?

Ans. It had been described in prior publications before that date.

X Int. 108. In your direct examination you have enumerated what you consider the advantages of the arch-shaped form. Please briefly restate these advantages, numbering them consecutively?

Ans. First, by making use of this shape the objectionable shadows are avoided; second, the expansion and contraction of the carbon, arising from changes in temperature, are compensated for in the arch itself without the necessity of adjusting its point or points of attachment; third, a longer carbon having a greater resistance can be placed in a globe or chamber of given dimensions; and, fourth, the distribution of light throughout the space to be illuminated may be made somewhat more uniform than with a straight carbon.

X Int. 109. So far as the original application is concerned, none of these advantages but the first is mentioned or hinted at; is this not true?

Ans. The first is the only one referred to as far as I observe.

X Int. 110. You have stated in your direct examination on the advantages which you consider to be possessed by a conductor of carbonized fibrous material; please restate what you consider the advantages of such a conductor to be, numbering them consecutively.

Ans. First, greater facility of selecting raw material of good and uniform quality for carbonization; second, ability to bring the material into proper form and size for thorough and uniform carbonization; third, ability to predetermine approximately the resistance to be given to the carbon before carbonization; fourth, convenience of thus shaping and forming while the material is 91
in a condition to be easily worked; fifth, the uniform specific resistance and mechanical condition of the carbon thus obtained; sixth, its susceptibility of being hardened and its resistance brought to a standard after carbonization; seventh, its superior mechanical qualities in respect to toughness, resilience, and durability. There are, perhaps, other minor advantages, but I think this list comprises the most essential ones.

111 X Q. Now, not one of these advantages are pointed out or even hinted at in the original application, are they?

Former objection repeated.

A. I think not.

112 X Q. If the inventors knew of these advantages, either of form or substance, don't you think it rather remarkable that in their original application no reference was made to them, or any of them?

Objected to as incompetent, and also for the reason stated in the former objection.

A. I do not know that it is. Such a statement of the advantages of an invention is very often omitted in the specification, and, in fact, in my practice as a solicitor before the Patent Office, I have occasionally been required by the examiner to erase every reference of the kind from the specification.

113 X Q. If your opinion as to the invention be correct, that the invention is not merely a conductor of fibrous carbon and in a horseshoe form, but such a conductor and in such a form, possessing certain qualities, do you not think it strange that the existance of these very things, namely, the qualities of the conductor on which you

would predicate infringement are in no way mentioned in the original application?

Objection continued.

A. I think it quite possible that the applicants were not
92 fully aware at the time the application was made of the *of the*
relative importance of this feature of their invention. The specification indicates that at the time of preparing the application they regarded the form of the incandescent conductor as the most important part of their invention. There is nothing unusual about this, as it is the most common thing in the world for inventors at first to fix upon some comparatively unimportant portion of their invention or discovery as its great feature, whereas this may be something that is old and well known, and no invention at all, while a better-informed person would see in some part of the invention, which its originators had regarded as of minor importance, a principle or combination of great value.

X Int. 114. Who, in such case, would be the inventor, the man that discovered the value or the man who had no idea of it?

(Objected to as incompetent.)

Ans. The latter, unquestionably. If a man should pick up a shining stone and show it to a lapidary, and he should tell the man that it was a diamond, it would none the less be the property of the original finder.

X Int. 115. Do you gather from the original specification that the point to which the inventors attributed value was the arch or horseshoe form?

(Objected to as incompetent.)

Ans. They certainly attributed value to the form, because they specially state its advantages, and they also claim the form, but they did not overlook the advantages of the carbon made from fibrous material, otherwise they would not have taken the trouble to specially claim an incandescing arc of carbonized paper as distinguished from carbon generally.

X Int. 116. But do you think, reading the original specification, that they considered the great point of their invention the arch form rather than the material?

Ans. I think that, taken as a whole, the specification and
93 claims perhaps indicate that the applicants attached rather
more importance to the form than to the specific material, but it is clear that they did not overlook the importance of the latter.

117 X Q. So far as there is any advantage in the arch form; that advantage is independent of the material of which the conductor is composed, is it not?

A. It may be said to be in one sense, but it is nevertheless true that the form and dimensions which it is possible to give to the arch may depend very greatly on the material of which it is made.

118 X Q. Take such form and dimensions as are shown in the

drawing of the patent. The advantages of such a form and dimensions are independent of the material, are they not?

A. The particular form and dimensions shown in the drawing could probably be constructed from almost any material which is capable of being used at all for an incandescent conductor.

119 X Q. Now are the advantages of the material independent of the form in which the material may be in?

A. Substantially, I think they are.

120 X Q. The original application speaks of the use of arches, both of fibrous carbon and of hard carbon; would there be any difference as to the durability in a lamp such as is shown in the drawing of a patent of a hard carbon conductor, and of a fibrous carbon conductor of the size of the conductor shown in such drawing?

(Objected to as incompetent.)

A. It would be hard to say, in the absence of experimental knowledge, but I should expect that it would be difficult to form such an arch from hard carbon which would be as uniform in its density and cross-section throughout as one made from structural carbon, and in case there were any want of uniformity giving rise to a greater resistance at one point than another, I should expect the carbon to become overheated at that point, and hence to be
94 liable to become fractured; but, as I have already intimated, I have no experimental knowledge which would enable me to answer the question positively.

X Int. 121. Are there not advantages of economy in the use of a vacuum over an artificial atmosphere of inert gas?

Ans. Undoubtedly.

X Int. 122. The inert gas would conduct the heat and thereby reduce the candle power and increase the heat of the lamp?

Ans. To some extent, unquestionably.

X Int. 123. This very increase of heat would endanger the life of the lamp?

Ans. I am not sure as to that; it might have some effect on it.

X Int. 124. You have referred to a publication in the "New York Herald," as I understand you, in your judgment, anticipates and describes the inventions of the claims of the patent in suit. I hand you what purports to be a copy of the fifth sheet of the "New York Herald" of Sunday, December 21st, 1879. Is this the article to which you referred?

(Objected to as not cross-examination and therefore not competent, and the alleged sheet of the "New York Herald" is objected to as incompetent.)

Ans. To be exact, I did not state the publication anticipted the invention, but that to the best of my recollection, it was published prior to the date on which the application for the patent in suit purports to have been made; that is to say, January 9th, 1880. The paper now handed me is, to the best of my recollection, similar to the publication which I had in mind, and I presume is a correct copy of the same.

X Int. 125. If the invention were made on the date of the application, this publication would anticipate it, as I understand you, in your judgment?

Ans. I have no doubt it would.

95 MAY 10TH, 1888.

Counsel for defendant produces what purports to be a copy of the Herald article referred to by the witness yesterday, and requests the examiner to mark the same "Herald article of December 21, for identification, H. D. G., examiner (L. C. W.) May 10th, 1888."

126 X Q. In your answer to the 55th question yesterday, if I understood you correctly, you said that in order for the fibrous conductor to possess the qualities necessary to be possessed in order to constitute infringement it would have to be cut either in the dimension of its thickness or width prior to carbonization. Would a conductor cut from a block of carbonized fibrous or textile material infringe the first claim of the patent?

A. In my opinion it would if it possessed the qualities which I have specified as being, in my judgment, essential to constitute it the article referred to by the first claim. I think, however, it is doubtful if carbon cut from a car-ized mass or block would, as a matter of fact, possess the qualities which would bring it within the scope of the first claim.

127 X Q. Do you base this opinion on the belief that the block of material could not be properly carbonized?

A. I think that in carbonizing a block of material the character, or at least the degree of carbonization would vary in different parts, being more complete and thorough near the external surface than in the interior. If it were possible to carbonize a block with uniformity in every part, and to cut from it an incandescing conductor which would possess all the qualities which I have said that I regarded as essential to constitute it the incandescing conductor of the first claim, then I should regard it as the conductor meant by the claim whether it was cut from a block or mass of fibrous carbon or not.

96

128 X Q. I understand it to be your opinion, however, that a block of carbon could not be so carbonized as — confer upon a conductor cut from it the properties you consider necessary. If this be so, assume that the patent as issued had contained the specification and claims as originally filed; would it in that case have stated to persons skilled in the art the invention so fully and completely as that those persons could have availed themselves of what you consider the valuable features of the invention? In answering this question, please bear in mind that there is no statement or suggestion in the original specification that the material is to be cut to size in the dimension of its width or thickness and carbonized as so cut.

Ans. While it is true that there is no explicit statement to this effect in the specification as originally filed, yet it is true that the use of paper is mentioned as one of the materials from which the incandescing conductor may be constructed, and paper is also specifically claimed as a material in one of the claims. Paper is unquestionably a fibrous material which has been brought to a shape adapting it for the purpose required in one of its dimensions before carbonization. I think therefore, that while there is no specific mention of the advantages to be derived from the use of paper, yet the fact that it is specifically claimed shows that the applicants considered it to possess such advantages.

X Int. 129. That may all be, but the point I should like your opinion on is, as to whether if the patent had issued with the specification and claims as originally filed, you would think that such a patent pointed out the invention in such a way as to enable persons skilled in the art to make, use and construct the same? You will of course bear in mind your testimony that the great point of the invention is in so carbonizing the material that it will possess the properties you have referred to?

Ans. The essential point of the invention seems to me to be the article of manufacture to which I have referred in my testimony heretofore, made of a certain material and possessing certain 97 qualities. Now this material, in one of its forms, is described in the original specification and pointed out in one of the claims, and it seems to me that it is quite sufficient not only to show what the invention is, but to enable it to be practised.

130 X Q. For the moment let us assume that all mention of paper were left out in the original specification and claim; would there then be anything to indicate to persons skilled in the art the way of making the conductor of the application so that it would possess the properties which give it value?

(Former objection repeated as to the file-wrapper and contents.)

A. I scarcely think so. The only reference which can at all be considered as bearing upon the matter is the mention of wood carbon among the substances which the applicants have tried, and wood carbon is apparently used as an alternative term for charcoal. Charcoal, however, is a substance which does not necessarily possess the qualities which I have said that I consider the essential characteristics of the material of the first claim; hence I think the original specification aside from the mention of paper does not definitely refer to the subject.

131 X Q. Now if you should take this original application and the drawing of the patent and wished to follow closely the apparatus shown and described, and were to make your conductor of paper covered with plumbago, please tell me just how you would prepare such a conductor. I ask you in making the conductor to follow the dimensions shown in the drawing.

(Objection continued.)

A. I think a person designing to follow the directions of the specification would first form his carbon of one or more thicknesses

of paper cut to the arch or horseshoe form, that he would then carbonize it and afterwards apply powdered plumbago to its surface,
and finally mount it in the lamp by attaching it to the lead-
98 ing-in conductors. As I have once before said, the language
of the specification does not make it quite clear whether the plumbago is intended to be applied before or after carbonization, but I think the most probable inference is that it meant after carbonization.

X Int. 132. Well, how would you apply it, and how much would you apply?

Ans. I should probably apply it by rubbing it on with a brush. As to the quantity, I should probably put on all that would adhere to the surface.

X Int. 133. How much would adhere to the surface?

Ans. I cannot say.

X Int. 134. What effect would the plumbago, as you would apply it, have on the conductor?

(Objected to generally as incompetent.)

Ans. I should not expect it to have any other effect than to diminish the electrical resistance of the incandescing conductor as a whole.

X Int. 135. Would the carbon, after the plumbago had been so applied, have the uniformity and purity of structure which the patent contemplates, according to your judgment?

Ans. I think so. I do not think that the purity or uniformity of structure is diminished by the external application of plumbago.

X Int. 136. Now let us see; if the plumbago had any effect, would it not lessen the resistance of the portion of the conductor to which it was applied?

Ans. It would be more nearly right to say that it would constitute an additional conductor parallel to and on the surface of the carbon conductor.

X Int. 137. The internal part of the conductor which the plumbago had not reached would have a different resistance than the outside on which the plumbago was, or the plumbago shell, if you choose to look at it in that way?

Ans. Yes.

X Int. 138. The practical effect would then be, would —
99 ance, and it would be deflected from the inner part to the
outer part of the conductor?

A. That would be the tendency, unquestionably.

139 X Q. Would the organic structure of the conductor at the point where the plumbago had been applied be interfered with by the filling up of the pores or cells?

A. No, I do not think it would. While the pores might be filled up, the organic structure or frame-work would remain unchanged, and the advantages which follow from its presence would be undiminished, the advantages being the toughness, flexibility and resilience which characterize the fibrous or cellular carbon.

140 X Q. Now, if you put enough plumbago on, all the current would leave the fibrous or paper interior, and you would practically

have as the light-giving part of the conductor a hard carbon conductor, would you not?

A. I think it would be quite impossible to mechanically attach a sufficient quantity of powdered plumbago to the surface of a conductor to deflect the whole or even the greater portion of the current from the organic part of the conductor.

141 X Q. From your knowledge of the art would you consider it an advantage or a disadvantage to cover the carbon with powdered plumbago?

A. I do not conceive that any disadvantages would arise from it except under certain conditions, as for example, when it was desired to make the resistance of the incandescing conductor as high as possible, in which case the plumbago would diminish it, and therefore be disadvantageous. On the other hand, if it were desired to make the resistance of the conductor very small, then the plumbago might possibly be of some advantage.

142 X Q. You express a doubt as to whether the true meaning of
this original application is that powdered plumbago is to be
100 placed upon the paper after carbonization or *or* before. If you
should conclude that it was to be placed upon the paper before, how would you make the paper conductor in accordance with the application?

(The former objection as to all examination relating to the application is repeated.)

Ans. I should brush the plumbago onto the surface of the paper after it was shaped, and before it was carbonized?

X Int. 143. Would this have any different or other effect than placing plumbago on the paper after it was carbonized?

Ans. I should expect it to have the same kind of effect, put perhaps in less degree.

X Int. 144. You say you would take several pieces of paper and put them together so as to get the thickness shown in the drawing; how would you cause the separate sheets of paper to adhere?

Ans. I should probably use some such material as molasses, which is capable of being converted into carbon by heat, and apply it to the surface and force them together by strong pressure.

X Int. 145. Would your pressure affect the organic structure of your carbon?

Ans. Only by diminishing the size of the cells or interstices. It would not injuriously affect it.

X Int. 146. Would the resistance of such a conductor be uniform in its different layers after carbonization?

Ans. Yes, if the different layers were cut from the same quality of paper.

X Int. 147. How about the molasses paste?

Ans. That might, of course, form a stratum of different conducting capacity from the paper, but as these strata are longitudinal and extend throughout the whole length of the incandescing conductor, and not transversely, they could produce no injurious results.

101 X Int. 148. How many sheets of paper would you have to

put together do you think to make up a conductor of the thickness shown in the drawing?

A. It would depend on the thickness of the paper used; possibly half a dozen thicknesses.

149 X Q. Would the molasses paste be about as thick as the sheets of paper between which it was placed?

A. No; it would need only to be very thin.

150 X Q. In the resultant mass what would be the relation in material between the paper and the molasses paste?

A. Possibly 50 to 1, or something like that.

151 X Q. To produce such a result you would have to lay the molasses on very thin, would you not?

A. Certainly.

152 X Q. Do you think it would be possible to lay it on so thinly as to have it bear that relation to the paper?

A. I should not expect to find any difficulty in doing so.

153 X Q. What would be the resistance of the carbonized molasses compared with the paper?

A. I have no means of judging. It probably would not be precisely the same; it might be more or less, I cannot say.

154 X Q. Would not the molasses penetrate the paper so that the resultant mass would be really a compound of paper and molasses?

A. That would depend on the condition of the paper. It would penetrate unsized paper, but in the case of sized or calendered paper I should expect it to remain on the external surface.

155 X Q. If you, as a result of this process, got a conductor in which the molasses had penetrated the paper to such an extent as to form a composite solid mass with the paper, would such a conductor have the same properties as a conductor of carbonized paper?

102 Ans. I should expect its properties to be the same except that its resistance would be lessened.

X Int. 156. In view of the fact that the only mention of paper in the original application is paper covered with plumbago, would you understand from the claim of the original application that the paper of the claim was the paper covered with plumbago, which the inventors had said they had tried?

(Former objection repeated.)

Ans. I do not think the claim would necessarily be limited to paper prepared with plumbago, even though no mention were made in the specification of paper not so prepared, provided that the use of paper, either with or without plumbago, was new, and either with or without plumbago would serve a more or less useful purpose in the application for which it was designed by the inventors.

X Int. 157. What do you understand to be meant by paper as used in the original application?

Ans. I suppose it to mean vegetable fiber, macerated and pressed into sheets and dried; the ordinary paper of commerce.

X Int. 158. You say the mention of paper suggests to your mind that the conductor was to be of the size of the paper in the dimension of its width or thickness. Upon what do you base that opinion?

Ans. Upon the fact that if paper in that form was carbonized, and cut to shape in its other dimensions before or after carbonization it would form a suitable incandescent conductor for the purposes contemplated by the applicants.

X Int. 159. Is there not on the market material which would come under the term "paper," which, as purchased, would not have the width or thickness desired for an incandescent conductor?

Ans. Material is sold in the market which is manufactured by substantially the same process as paper, which perhaps would
103 be too thick to be capable of thorough and suitable carbonization for the purpose intended. Such material does not, I think, go under the ordinary designation of paper. The thicker papers or paper-like fabrics, being usually termed cards or boards. I suppose there must be in trade some certain thickness that technically distinguishes paper from board, although I do not know what it is, except in a very general way.

160 X Q. Do you think that all material that is of the same general composition and character and origin as paper, but which does not come in sheets like sheets of writing paper, is excluded from the term paper, as used in the application?

A. It would be to some extent a matter of experiment to determine whether material of this character were included or not. In speaking of paper, the applicants evidently intended to convey information that paper of the ordinary and usual thickness would serve the purpose. It might be found by experiment that fibrous board of considerable thickness, not commercially known as paper, would also serve the purpose, and it might also be found by further experiment that beyond a certain thickness the material would be incapable of receiving proper and uniform carbonization; therefore it would be left to the discretion, knowledge and observation of the constructor as to how far he might safely go in this direction.

161 X Q. How thick would a sheet of paper have to be outside of what you consider the inventors to have meant by the term paper in the application?

A. It is difficult to say exactly; perhaps something like one sixty-fourth of an inch might be considered as a very thick paper. I am not sufficiently conversant with the technicalities of the paper trade to say exactly, if, indeed, there be any exact limit.

162 X Q. How do you know that the inventors in their
104 original specification did not contemplate carbonization of a large block or mass of paper and the cutting of the conductor from this mass after its carbonization?

(Former objection repeated.)

Ans. If they had meant to include such blocks or masses I should have expected them to use some more appropriate term, as for example, papier-mache, which is one of the names given to masses of paper-like material of that character. In their use of the word paper it is reasonable to suppose that they use the word in its ordinary signification.

X Int. 163. If they had contemplated cutting fibrous material to size in the width or thickness of the conductor, would it not be equally reasonable to suppose that they would have pointed out that fact.

(Objection repeated.)

Ans. Possibly.

X Int. 164. If in point of fact the inventors contemplated carbonizing a mass of fibrous material and cutting the conductor from such mass, all that you regard as of value in the invention was not contemplated by them?

Ans. If they had contemplated that method of procedure alone to the exclusion of the process of bringing the mass to form in one of its dimensions, then I think as a matter of fact that what I regard as the most important part of the invention would not have been present, because I do not consider that the results aimed at could have been reached in that way.

X Int. 165. If we assume that fibrous material carbonized was original with the inventors of the patent in suit, and if we further assume that the patent had been issued on the application as filed, do we not practically come to this point: That the patent would not disclose in and of itself the value you attribute to the invention, but its value could only be ascertained by independent and outside experimentation. To be more specific: If a man should carbonize
a mass of fibrous material, and cut his conductor from it he
105 would not attain the value of the invention; if, however, he
should cut his material to size and then carbonize it, he
would, but it would be left to his judgment and to experiment and test on his part to ascertain which was the valuable thing to do. To conclude, the work of getting the valuable conductor would not depend on his following the patent, but upon his ascertaining for himself, outside of the patent and independent of the patent, what was the proper thing to be done?

A. I cannot quite agree with you in your statement. The application describes the use of carbonized paper, and expressly claims it as the specific form of carbon, which it may be presumed from this fact the inventors considered either the most novel or the most useful form of it. If the constructor followed the specification in this particular he would obtain a product having certain valuable qualities. I do not see why any further experimentation should be required. He has simply to put this carbon into the lamp as directed, and it is ready for use.

166 X Q. But how about the fibrous material other than paper?

A. The descriptions and directions as to other fibrous material are very meagre, and possibly insufficient to identify any particular material, but it seems quite clear to me that the applicants have described one form of material namely, paper, which is useful, and which is sufficient to support the claim which is made for it, and also a broad claim for fibrous or textile material.

167 X Q. If they regarded their invention in the same light as you regard it, this original application is a mighty bad one, isn't it?

A. It must be admitted that it is susceptible of much improvement.

168 X Q. In pointing out the properties which the carbon made
from fibrous material must possess in order to infringe the in-
106 vention as you regard it, you say in your 52d answer, "it
must have been carbonized in such a manner as to preserve
the organic structure of the material." Suppose the organic structure of the fibrous material to have been destroyed, would a conductor made from this material, in your judgment, infringe the invention of the first claim?

Ans. If the organic structure of the material be destroyed, the carbon would be friable and inflexible, destitute of toughness, elasticity and strength, and would, therefore, be useless for the purposes contemplated by the patentees; hence, in my opinion, it would not be within the scope of the claims.

X Int. 169. Are you familiar with what is known as tamadine?

(Objected to as incompetent.)

Ans. I know something of its character and properties.

X Int. 170. Would a conductor of such material be within the invention of the patent, as you understand it?

Ans. I think so.

X Int. 171. Is the organic structure of the fibrous material there destroyed?

Ans. I do not think it is. The coarser organic structure is broken up, but the extreme toughness and tensile strength of the material shows that the essence of the organic structure is still present.

X Int. 172. Suppose I got a hard carbon conductor which had the requisite flexibility, elasticity and toughness and durability, and had the same general properties which you consider necessary to the invention of the patent in suit, would such a conductor infringe, in your opinion?

Ans. It would not, because, in the language of the first claim, the carbon must be of carbonized fibrous or textile material, and, in the language of the second claim, of carbonized fibrous material, and, in the language of the fourth claim, made from a fibrous or textile material, and neither of these things would be true, in any sense, of
the material technically known as hard carbon.

107 173 X Q. In a series arrangement of lamps, assuming the
same conditions to which I referred yesterday, namely, a
thousand lamps in the series, the destruction of the first lamp would cause the other 999 to go out unless some means were provided for switching the current from the lamp that was broken?

A. Yes.

174 X Q. Under the conditions we have assumed of a thousand lamps in series, each lamp of one ohm resistance, you have said that a current of approximately a thousand volts would be required to bring them to incandescence. If this current of 1,000 volts were put through but one lamp, would it not destroy the lamp?

A. Undoubtedly.

175 X Q. In referring to the drawing of the patent in suit you have mentioned that the length, thickness and width of the carbon conductor there shown could be reduced. As you increase the length of the conductor or decrease the width or thickness, would you not have to introduce corresponding changes in the structure itself, and would not the difficulty of maintaining the life of the carbon be increased as you decreased its width or thickness, or increased its length?

A. It would undoubtedly be advisable, though perhaps not strictly necessary, to modify the construction of some of the other parts of the lamp, if the length of the incandescing conductor were greatly increased and its cross-section diminished, and it is unquestionably true that, other things being equal, the longer and thinner the incandescent conductor the less is the life of the lamp.

176 X Q. Suppose you took the exact structure shown in the drawing and put in place of the fibrous conductor shown in the drawing the fibrous conductor of defendant's lamp; how long do you think it would last?

A. I have no means of forming even an approximate es-
108 timate, but I may say that its life would be very much —
than that of the thick and short conductor shown, and would be much shorter than it would be in a chamber so constructed as to maintain continuously a high artificial vacuum.

X Int. 177. Please tell me in units of time what your best judgment would be as to how long it would last. I, of course, understand that any answer you may make to this question is largely of the nature of a guess.

Ans. I prefer not to express any opinion in the absence of any experimental knowledge on the subject.

X Int. 178. I am sorry to press the question, and we will take your answer with due allowance for the absence of experimental knowledge. Will you be good enough, therefore, to answer my previous question, in units of time?

Ans. It would be quite impossible for me to express an opinion on this matter which would be of any value whatever. I am quite willing to repeat the statement I have already made; that its life would be very much shorter than that of the short and thick incandescent conductor, and very much shorter than it would be in a high vacuum.

X Int. 179. The difficulty is that in general expressions like "very much shorter" we do not present the sharp contrast which I would like to get upon the record. The life of such a lamp as defendant's is, in the present state of the art, I assume, thoroughly well known. The average life of such a lamp would be in the neighborhood of a thousand burning hours, would it not?

Ans. In the case of a well-constructed lamp, such as is easily attainable in the present state of the art, I think your assumption quite within limits.

X Int. 180. Well, now what, in burning hours, minutes or seconds, do you think would be the life of a carbon filament such as is shown in defendant's lamp, if put in the exact structure shown in the drawing of the patent?

Ans. I must repeat that I cannot form an opinion, for while I have considerable experimental knowledge of the performance of lamps substantially of the construction and dimensions of the defendant's lamp, I have no practical experience whatever with incandescent carbons enclosed in a chamber constructed precisely like that described in complainant's patent, and in the absence of such knowledge I must decline to express a definite opinion. 109

181 X Q. Are you aware that a suit on this same patent is pending in the United — circuit court for the southern district of New York between The Edison Electric Light Company as defendant and The Consolidated Electric Light Company as complainant?

A. I am.

182 X Q. Have you read the deposition of Professor Edwin J. Houston, who was called as an expert by the complainant in such suit?

A. I have read portions of it.

183 X Q. In that case the following question was asked and the following answer made by Professor Houston:

"264 X Q. What do you understand to be meant by carbonized paper covered with plumbago?"

"A. By the use of the phrase 'carbonized paper covered with plumbago,' as contained in the language of the original specification, I understand the phrase as a somewhat awkward manner of expressing the method employed in obtaining the carbonized paper. The paper was *to* covered with powdered plumbago while subjected to the carbonizing heat. This method of carbonizing material was well known in the art, and is the method most commonly used at this time in the manufacture of incandescent electric lamps, and I suppose that the inventors did not consider it necessary to enter more fully into detail."

I understand that you do not agree with his opinion of Professor Houston that the expression "carbonized paper covered with plumbago" means that the paper was covered with plumbago while undergoing the process of carbonization?

110 (Objected to as incompetent.)

Ans. While I do not wish to traverse the statement of Professor Houston, yet his interpretation of the phrase in the specification is one which had not occurred to me, and I still think that my own interpretation is a more natural and probable one.

X Int. 184. Are you aware that in the suit referred to Professor Houston regarded the use of bamboo as an infringement of the third claim of the patent in suit?

Ans. That is my understanding of his testimony.

X Int. 185. I understand that you do not concur in that view.

Ans. No; I have not felt myself justified in taking that position.

X Int. 186. In the patent, as issued, the specification states that the inventors have used the burners of the patent in a vacuum, in nitrogen gas and in hydrogen gas. The statement is then made "but we have obtained the best results in a vacuum, or an attenuated atmosphere of nitrogen gas." I understand it to be your opinion, as an expert, that such a lamp as shown in the drawing of the patent would yield the best results if an inert atmosphere were used instead of a vacuum; or, in other words, your opinion theoretically would be contrary to their statement. Am I correct in so understanding you?

Ans. I do not understand that there is any real conflict between the statement in the specification and the opinion which I have expressed. The patentees say that the two best results are those which have been attained in a vacuum and in nitrogen gas, but they do not undertake to say which of these two is the best. I have said that, in my opinion, the nitrogen would be likely to give the best results of those two.

Redirect examination by Mr. Kerr:

Int. 187. Refer to your answer to question 22, and explain what thickness of cement you had in mind.

111 A. Such a layer of cement as would ordinarily be used for the purpose of packing the joint in the manner indicated by the patentees. A thin layer would be all that would be necessary or proper to be used.

New York, *May 24th*, 1888.

The examination of Franklin L. Pope is continued by consent at the office of John C. Tomlinson, counsel for defendant, No. 40 Wall street.

188 Q. State whether the incandescing conductor formed of carbonized paper, mentioned in the third claim, would, in your opinion, possess the properties or advantages which in your answer 110 you consider to be possessed by a conductor of carbonized fibrous material.

A. It would unquestionably. The quality of paper may be very readily determined upon by inspection; it is already in proper size in one dimension for thorough and uniform carbonization; its resistance can be approximately predetermined, being in proportion to the area of its cross-section, or very nearly so; it is readily shaped before carbonization; its resistance after carbonization is quite uniform; it may be hardened and its resistance standardized after carbonization, and its mechanical qualities are excellent.

189 Q. Assuming that the expression "fibrous or textile material," as used in the first, second and fourth claims should be merely held to be synonomous with the word "paper" as used in the third claim, would you still have the same opinion as you have expressed about that claim, and its embodiment in the defendant's lamp?

A. In my direct testimony I have stated the understanding of this patent, which appeared to me to be the most natural and proper one; that is to say, that it contains certain generic claims for an

illuminant made of carbonized fibrous or textile material
112 broadly, and also a specific claim to such an illuminant when
made of one particular kind of such material, namely "paper," a material formed by artificial means as distinguished from other organic material in which the structural arrangement is natural, or the result of organic growth. If the word "paper," as used in the third claim, is to be regarded as synonymous with the expression "fibrous or textile material," as used in the first, second and fourth claims, then I should regard any sort of fibrous or textile material having the same properties as respects this particular use, which I have named in my fourth answer, and by which the same advantages are reached, as constituting an equivalent thereof, and covered by the said claim; that is to say, supposing the specification to remain as it now is, and the third claim to be the only claim of the patent, there is no doubt in my mind that other organic substances capable of the same use, and having the same properties, so far as the object and purpose of the invention is concerned, would be equivalents of paper. The specification mentions wood as a suitable material, and bamboo being a particular variety of wood, would fall within the general definition, and would therefore, under these circumstances, be an equivalent of paper.

Recross-examination by Mr. TOMLINSON:

X Int. 190. Do you still adhere to the opinion expressed by you in your direct examination and cross-examination, that the defendant's lamp is not covered by the third claim?

Ans. With my present understanding of the specification and claims, I still think that the third claim, in view of the language of the first, second and fourth claims, is limited to a carbon made of paper in the ordinary signification of that term, and, therefore, that the defendant's lamp does not infringe it.

X Int. 191. If then fibrous or textile material, as used in
113 the first, second and fourth claims, should be held to be merely
synonymous with the word paper as used in the third claim, as assumed by you in answer to question 189, would you consider such holding to be correct?

A. I should hardly think so. All paper is, of course, fibrous or textile material, but all fibrous or textile material is not paper in any usual or proper signification of the term. I regard paper as a material in which the structural organization is partially or entirely artificial, and therefore it does not seem to me proper to consider the term synonymous with the broader expression "fibrous or textile material."

FRANKLIN L. POPE.

Proof of the incorporation of the Electro-Dynamic Light Company, and of the Eastern Electric Manufacturing Company, is hereby waived by counsel by defendant.

Certification of the copies of the afore-mentioned six assignments is hereby waived by counsel for defendant.

Complainant's case closed.

Complainant's Exhibit Sawyer and Man Assignment of October 14, 1878. H. D. G., Ex'r.

Whereas, we, William Edward Sawyer, of the city, county and State of New York, and Albon Man of Brooklyn, county of Kings and State aforesaid, have made the following-entitled inventions, viz:

Firstly. Certain improvements in "electrical lighting apparatus and circuits."

Secondly. Certain improvements in "carbons for electric lights," and in the treatment thereof—for which we are about to apply for letters patent of the United States—and whereas the "Electro-Dynamic Light Company," a corporation created and existing under and by virtue of the laws of the State of New York, has purchased of us all our right, title and interest in and to said 114 inventions, and any and all letters patent of the United States, which may be hereafter granted for the same; and has paid us for the said inventions the sum of one dollar, and given us other good and sufficient considerations for the same, the receipt of which we hereby acknowledge, and with which we hereby declare ourselves satisfied, contented and paid—now, therefore, upon consideration aforesaid, we, the said William Edward Sawyer and Albon Man, have — and do hereby sell, assign and convey to the said company the whole of our right, title and interest in and to the said inventions, and any and all United States letters patent, which may hereafter be granted for the same, for the said company to have, hold and enjoy for its own use and behoof, and for the use and behoof of its legal representatives as fully and entirely as we would have held and enjoyed the same had this assignment and sale not been made, for the whole term for which said letters patent may be granted including any extensions thereof, and through the whole of the United States and the Territories thereof; and we do hereby covenant for ourselves and our legal representatives, that we are now the sole owners of said inventions, and have good right and lawful authority to make and execute this conveyance, in manner aforesaid, and that we will at any and all proper and reasonable times make and execute any and all proper papers that may be necessary to apply for and obtain letters patent of the United States, for said inventions and any and all proper papers that may be necessary to vest the title thereof in said corporation.

In witness whereof, we have hereunto set our hands and seals this the 14th day of October, 1878.

COMPLAINANT'S EXHIBIT ELECTRO-DYNAMIC LIGHT COMPANY ASSIGNMENT OF APRIL 6TH, 1881. H. D. G., Ex'r.

This deed of assignment, made this, the 6th day of April, 1881, between the Electro-Dynamic Light Company, a corporation created and existing under and by virtue of the laws of the State of New York, of the first part, and William H. Church, of Brooklyn, county of Kings and State of New York, of the second part.

116 Witnesseth: That for the consideration hereinafter mentioned the said Electro-Dynamic Light Company has and does hereby assign, transfer and convey to the said William H. Church, all and singular the letters patent of the United States dated and numbered as follows, viz: One dated June 25, 1878, and numbered 205,303 for "improvement in electric lighting systems;" one dated June 18th, 1878, and numbered 205,144 for "improvement in electric lamps;" one dated June 25th, 1878, and numbered 205,305 for "improvement in regulators for electric lights;" one dated November 19th, 1878, and numbered 210,152 for "improvement in switches for electric lights;" one dated December 10th, 1878, and numbered 210,809 for "improvements in electric lamps;" one dated January 7th, 1879, and numbered 211,262 for "improvements in carbons for electric lights;" one dated June 29th, 1880, and numbered 229,335 for "carbons for electric lights;" one dated June 29th, 1880, and numbered 229,476 for "improvement in electric switches;" one dated November 19th, 1878, and numbered

210,151 for "improvement in electric meters;" one dated September 16th, 1879, and numbered 219,771 for "improvements in electric lamps;" one dated February 8th, 1881, and numbered 237,632 for "dynamo-electric machines," and also two undivided fifths of the whole of letters patent of the United States numbered and dated as follows, viz: One dated August 14th, 1877, and numbered 194,111 for "electric engineering and lighting apparatus and system;" one dated August 21st, 1877, and numbered 194,500 for "electric candles;" one dated August 28th, 1877, and numbered 194,563 for "electric lighting apparatus;" one dated November 6th, 1877, and numbered 196,834 for "electric engineering and lighting systems;" which interests in said last-mentioned letters patent were assigned by William E. Sawyer to Albon Man by a certain deed of assignment dated May 14th, 1878, and recorded in Liber S 22,
117 page 464, Transfers of Patents, and which interests in said
patents were duly assigned by said Albon Man to said Electro-Dynamic Light Company by deed of assignment duly recorded in the Patent Office in Liber C 24, in pages 294, 295, 296, and 297, and dated, all of them, July 15th, 1878, together with all and singular the invention owned by said company, and described, illustrated, claimed or suggested in said letters patent; and also all inventions owned by said company, for which applications for patents are now pending in the United States.

And also all covenants, assignments and agreements made by William E. Sawyer with Albon Man, and assigned to said Electro Dynamic Light Company, and which are now owned by said company, having reference to said patents and inventions, any or either of them, in which said company is interested, in so far as the said covenants or agreements appertain to letters patent for said inventions, any or either of them, in the United States of America, but not elsewhere, for the said William H. Church to have, hold and enjoy for his own use, benefit and behoof, and for the use, benefit and behoof of his assigns and legal representatives to the full end of the term for which said letters patents have been, or may hereafter be granted, issued, reissued, or extended, any or either of them, in and for the whole of the United States and the Territories thereof, and also all covenants and agreements at any time made by the said William E. Sawyer and Albon Man, or either of them, jointly or severally, with the said Electro-Dynamic Light Company for the reissue or extension of said letters patent, any or either of them, or that in anywise appertains to said patents and inventions, or applications for patents for the same in the United States of America, but not elsewhere, and that as fully and entirely as the same would, might and could have been held and enjoyed by the said Electro-Dynamic Light Company had this assignment and transfer not been made.

In trust, nevertheless, for the said William H. Church
118 to hold to the use and benefit of the said Electro-Dynamic
Light Company, and especially to assign, transfer and convey to the Eastern Electric Manufacturing Company, of Middletown, Connecticut.

All and singular the said letters patents and inventions, and applications for letters patents, and the covenants and agreements aforesaid, the same to all intents and purposes as the said Electro-Dynamic Light Company, does hereby assign, transfer and convey the said letters patents, inventions, applications for patents, covenants and agreements to the said William H. Church and his assigns.

The consideration for this deed is that the said William H. Church subscribe for nine-twentieths of the whole of the capital stock of the Eastern Electric Manufacturing Company, and pay for the same by transferring, conveying and assigning to said company the whole of said letters patents, inventions, applications for letters patents, covenants and agreements aforesaid. The said William H. Church being hereby authorized to receive from said company the certificate or certificates of transfer of said stock of said Eastern Electric Manufacturing Company, and hold the same for the use and benefit of the share and scrip holders of the Electro-Dynamic Light Company, according to their respective interest in said company, after having first assigned and transferred to such persons as shall be designated by the trustees of the Electro-Dynamic Light Company such shares of stock of the Eastern Electric Manufacturing Company as the said board of trustees deem expedient and proper, and which division of shares having been made and accepted as aforesaid, the trust hereby created shall cease and determine, and the said trustee shall be discharged of his said trust.

It being the intention of this instrument that the said William H. Church, as such trustee, shall convey to the said Eastern Electric Manufacturing Company the title absolutely to the letters pat-
119 ents, inventions, applications for letters patent, covenants and agreements aforesaid, and not to continue the trust hereby created.

In witness whereof, the said Electric Dynamic Light Company has hereto subscribed its name and affixed its seal by its president and treasurer, the day and year above written.

Complainant's Exhibit Church Assignment of April 6th, 1881.
H. D. G., Ex'r.

This deed of assignment made this, the 6th day of April, 1881, between William H Church, of Brooklyn, in the county of Kings and State of New York, trustee of the Electro-Dynamic Light Company, and of its share and scrip holders, of the first part; and the Eastern Electric Manufacturing Company, of Middletown, Connecticut, a corporation created and existing under and by virtue of the laws of the State of Connecticut, and having an office and workshop in the city of New York, of the second part.

Witnesseth: That whereas by a certain instrument of writing bearing even date herewith, the Electro-Dynamic Light Company, a corporation created and existing under and by virtue of the laws of the State of New York, assigned, transferred and conveyed to the said William H. Church all and singular the letters patent of the United States dated and numbered as follows, viz: One dated June 25th, 1878, and numbered 205,303 for "improvement in electric lighting systems;" one dated June 18th, 1878, and numbered 205,144 for "improvement in electric lamps;" one dated June 25th, 1878, and numbered 205,305 for "improvement in regulators for electric lights;" one dated November 19th, 1878, and numbered 210,152 for "improvement in switches for electric lights;" one dated December 10th, 1878, and numbered 210,809 for "improvements in electric lamps;" one dated January 7th, 1879, and numbered 211,262 121 for electric lights;" one dated June 29th, 1880, and numbered 229,476 for "improvement in electric switches;" one dated November 19th, 1878, and numbered 210,151 for "improvement in electric meters;" one dated September 16th, 1879, and numbered 219,771 for "improvement in electric lamps;" one dated February 8th, 1881, and numbered 237,632 for "dynamo-electric machines," and also two undivided fifths of the whole of letters patent of the United States numbered and dated as follows, viz: One dated August 14th, 1877, and numbered 194,111 for "electric engineering and lighting apparatus and system;" one dated August 21st, 1877, and numbered 194,500 for "electric candles;" one dated August 28th, 1877, and numbered 194,563 for "electric lighting apparatus;" one dated November 6th, 1877, and numbered 196,834 for "electric engineering and lighting systems," which interests in said last-mentioned letters patents were assigned by William E. Sawyer to Albon Man by a certain deed of assignment dated May 14th, 1878, and recorded in Liber S 22, page 464, Transfers of Patents, and which interests in said patents were duly assigned by said Albon Man to said Electro-Dynamic Light Company by deed of assignment duly recorded in the Patent Office in Liber C 24, in pages 294, 295, 296 and 297, and dated, all of them, July 15th, 1878, together with all and singular the inventions owned by said company and described, illustrated, claimed or suggested in said letters patent, any or either of them, and all interests in said letters patent owned by said company, any or either of them, whether owned by said company in whole or in part, and also all inventions owned by said company for which applications for patents are now pending in the United States, and also all assignments, covenants and agreements made by William E. Sawyer with Albon Man, and assigned to said Electro-Dynamic Light Company, or which are now owned by said company, having reference to said patents and inventions, any 122 or either of them, in which the said *by said company, having reference to said patents and inventions, any or either of them, in which the said,* company is now interested in so far as the said covenants or agreements appertain to letters patent for said inventions, any or either of them, in the United States of America, but not elsewhere, for the said William H. Church to have, hold and enjoy for his own use, benefit and behoof, and for the use, benefit and behoof of his assigns and legal representatives, to the full end of the term for which the said letters patents have been or may hereafter be granted, issued, reissued or extended, any or either of them, in and for the whole of the United States and the Territories thereof, and also:

All covenants and agreements at any time made by the said William E. Sawyer and Albon Mann or either of them jointly and severally, with the said Electro-Dynamic Light Company for the reissue or extension of said letters patent, any or either of them, or that in any way appertains to said patents and inventions or applications for patents for the same in the United States of America, but not elsewhere, and that as fully and entirely as the same would, might or could have been held and enjoyed by the said Electro-Dynamic Light Company had said assignment and transfer not been made.

In trust, nevertheless, for the said William H. Church, to hold to the use and benefit of the said Electro-Dynamic Light Company, and especially to assign, transfer and convey to the said Eastern Electric Manufacturing Company of Middletown, Connecticut.

All and singular the said letters patent and inventions and applications for letters patent and the covenants and agreements aforesaid, the same to all intents and purposes as the said Electro-Dynamic Light Company conveyed the same to said William H. Church and his assigns.

123 The consideration for said deed from said Electro-Dynamic Light Company to said Church being that said Church shall subscribe for nine-twentieths of the whole of — company, and pay for the same by transferring, conveying and assigning to said company the whole of the said letters patents, inventions, applications for letters patent, covenants and agreements aforesaid.

The said William H. Church is authorized by said deed to receive from said company the certificate or certificates of transfer of said stock of said Eastern Electric Manufacturing Company.

Now, therefore, the said William H. Church having accepted the trust created by said deed hereby covenants that he has subscribed for said nine-twentieths of the whole of the capital stock of the said Eastern Electric Manufacturing Company, and that the certificate of transfer of said stock has been delivered to him by said company.

Wherefore, in consideration of said nine-twentieths of the whole of said capital stock of said Eastern Electric Manufacturing Company, the said William H. Church, as trustee for said Electro-Dynamic Light Company, and its share and scrip holders, has, and he does hereby assign, transfer and convey to the said Eastern Electric Manufacturing Company, all, and singular the aforesaid letters patents and inventions and applications for letters patents, and all and singular the covenants and agreements so conveyed to him by the Electro-Dynamic Light Company, as aforesaid, and that as fully and entirely as the same were conveyed to said Church by said deed, for the said Eastern Electric Manufacturing Company, its successors and assigns, to have, hold and *and* enjoy for its and their own use, benefit and behoof absolutely through the whole of the unexpired term of said letters patent, any or either of them, and through all the renewals, reissues and extensions thereof.

In witness whereof, the said William H. Church, trustee, has hereunto set his hand and seal, the day and year above written.

WM. H. CHURCH, *Trustee.* [SEAL.]

Complainant's Exhibit Eastern Electric Manufacturing Company's Assignment of September 30th, 1882. H. D. G. Ex'r.

This deed of assignment made this 30th day of September, 1882, by and between the Eastern Electric Manufacturing Company, of Middletown, Connecticut, a corporation created and existing under and by virtue of the laws of the State of Connecticut, and having an office in the city of New York, of the first part; and the Consolidated Electric Light Company, a corporation created and existing under and by virtue of the laws of the State of New York, and having its principal place of business in the city of New York.

Witnesseth: That whereas the said Eastern Electric Manufacturing Company is the owner of certain inventions and letters patent of the United States, hereinafter mentioned and designated.

And whereas, by a certain instrument in writing dated June 10th, 1882, and a certain supplemental agreement dated July 8th, 1882, the said Eastern Electric Manufacturing Company, for the consideration of four thousand and five hundred shares of the capital stock of said Consolidated Electric Light Company of the par value of one hundred dollars each, full paid and non-assessable, and for other considerations mentioned in said contract of June 10th, 1882, and said supplement of July 8th, 1882, agreed to convey to said Consolidated Electric Light Company all and singular the
125 inventions, letters patent, rights and franchises now belonging to it, and belonging to it at the time of making said agreement of June 10th, 1882.

Now, therefore, in performance of said agreement, and in consideration of said four thousand and five hundred shares of the capital stock of said Consolidated Electric Light Company of the par value of one hundred dollars each full paid and non-assessable, and for other considerations mentioned in said contract ,the rec-ipt of which is hereby acknowledged,

The said Eastern Electric Manufacturing Company hereby assigns, transfers and conveys to the said Consolidated Electric Light Company all and singular the inventions, letters patent, rights and franchises now owned by it, and owned by it at the time of making said contract of June 10th, 1882, and especially the joint letters patent of the United States granted to William Edward Sawyer and Albon Man, dated and numbered as follows, viz:

One dated June 25th, 1878, and No. 205,303.
One dated June 18th, 1878, and No. 205,144.
One dated June 25th, 1878, and No. 205,305.
One dated November 19th, 1878, and No. 210,152.
One dated December 10th, 1878, and No. 210,809.
One dated January 7th, 1879, and No. 211,262.
One dated June 29th, 1880, and No. 229,335.
One dated June 29th, 1880, and No. 229,476.

And also the letters patent granted to William Edward Sawye*d* dated and numbered as follows, viz: One dated November 19th, 1878, and No. 210,151; one dated September 16th, 1879, and No. 219,771; one dated February 8th, 1881, and No. 237,632.

And also two undivided fifths of the whole of each of the following letters patent granted to William Edward Sawyer, viz:

One dated August 14th, 1877, and No. 194,111.

One dated August 21st, 1877, and No. 194,500.

One dated August 28th, 1877, and No. 194,563.

126 One dated November 6th, 1877, and No. 196,834.

And also the joint letters patent of the United States granted to William E. Sawyer and Edward R. Knowles dated May 10th, 1881, and No. 241,242.

And also the joint letters patent of the United States granted to William Edward Sawyer and Robert Street, dated and numbered as follows, viz:

One dated May 10th, 1881, and No. 241,430.

One dated August 23d, 1881, and No. 245,976.

Also the joint letters patent of the United States granted to William Edward Sawyer and William Sawyer, dated and numbered as follows, viz:

One dated December 14th, 1880, and No. 235,460.

One dated January 11th, 1881, and No. 236,460.

And also the letters patent of the United States granted to Thomas B. Stillman, numbered and dated as follows, viz:

One dated March 23d, 1880, and No. 225,730.

One dated April 20th, 1880, and No. 226,632.

One dated May 11th, 1880, and No. 227,454.

And also the letters patent of the United States granted to Edward R. Knowles, dated May 11th, 1880, and No. 227,365.

And also the letters patent of the United States granted to William Sawyer, dated and numbered as follows, viz:

One dated February 17th, 1880, and No. 224,612.

Six dated May 11th, 1880, and numbered respectively 227,386, 227,387, 227,388, 227,389, 227,390 and 227,845.

Two dated May 25th, 1880, and numbered respectively 228,122 and 228,123.

Two dated July 20th, 1880, and numbered respectively 230,345 and 230,346.

One dated October 12th, 1880, and No. 233,284

Two dated December 14th, 1880, and No. 235,385 and 235,459 respectively.

One dated February 8th, 1881, and No. 237,608.

Together with all and singular the inventions owned by 127 the said Eastern Electric Manufacturing Company, and described, illustrated, claimed or suggested in said letters patent, any or either of them, and all interest in said letters patent, any or either of them whether owned by said company in whole or in part, and also all inventions owned by said company for which applications are now pending in the United States, and especially the application No. 547, filed January 9th, 1880, and all the divisions thereof, and also any and all applications which may be made, arise or grow out of, or in anywise appertain to any or either of said letters patents, or applications for patents now pending.

And also, all assignments, grants, licenses, covenants and agreements owned by said Eastern Electric Manufacturing Company, in anywise appertaining to said patents, any or either of them, or to any patents or inventions appertaining to electric lighting now owned by said company, are hereby conveyed to said Consolidated Electric Light Company for the said company to have, hold and enjoy for its own use, benefit and behoof; and for the use, benefit and behoof of its successors, assigns and legal representatives to the full end of the term for which said letters patent are, or may hereafter be granted, issued, reissued or extended, any or either of them, in and for the whole of the United States and Territories thereof.

And also all the property and assets of every nature and kind whatsoever belonging to the said Eastern Electric Manufacturing Company, and all which belonged to it at the time of making said contract of June 10th, 1880, is hereby transferred and conveyed to the said Consolidated Electric Light Company, and that as fully and entirely as the same would or might have been held and enjoyed by the said Eastern Electric Manufacturing Company *and* this assignment and transfer not have been made.

And the said Eastern Electric Manufacturing Company hereby covenants with the said Consolidated Electric Light Company that it is now the sole owner of the whole of said inventions and letters patent; that it has now the sole and exclusive right to use said inventions, and to work said letters patent, subject only to the licenses and agreements hereinafter mentioned, the whole of which are hereby conveyed to said Consolidated Electric Light Company as aforesaid; and that said inventions and letters patent are free, clear and not encumbered by, or for any claim, lien, mortgage or demand whatsoever; and that it has good right and lawful authority to make and execute this deed of assignment, and transfer in manner and form as aforesaid. 128

And said Eastern Electric Manufacturing Company hereby covenants with the said Consolidated Electric Light Company that the following and no other licenses and contracts under and appertaining to said patents have been made by it, and are now outstanding, viz: A certain license dated March 1st, 1881, to the Commonwealth Electric Light and Manufacturing Company of Pennsylvania, and a certain supplement thereto dated June 8th, 1882, granting the right to use said patents and inventions in the State of Pennsylvania. A certain license dated October 14, 1881, to the Illinois Electric Manufacturing Company for the State of Illinois. A certain agreement by said company with A. J. Works, dated August 27th, 1880, appertaining to certain rights under the patents then owned by it in the District of Columbia, and the State of West Virginia.

The said Eastern Electric Manufacturing Company hereby conveys to said Consolidated Electric Light Company all its right, title and interest in and to said licenses and agreements, and all its rights of action thereunto appertaining both in law and equity, and all benefits and advantages growing out of the same:

The said Consolidated Electric Light Company taking this assignment subject to the conditions and advantages of said licenses and agreements.

And it is hereby covenanted and agreed between the said Eastern Electric Manufacturing Company and said Consolidated
129 dated Electric Light Company, and this assignment is made
upon this express condition:

That said Consolidated Electric Light Company shall not sell, lease or otherwise dispose of all its patents, patent rights, and other rights and property to any individual or corporation, nor by lease, license, or otherwise grant to any individual or corporation having an interest, directly or indirectly, in any other patents or system of electric lighting, any rights under said patents, nor permit the use or exercise of such rights by such individual or corporation without the consent in writing of holders of not less than five-sixths of the capital stock of said Consolidated Electric Light Company, and that all conveyances, grants and licences made by said Consolidated Electric Light Company under said patents, any or either of them, in violation thereof, shall be absolutely null and void as being without authority and of no force or effect in law.

In witness whereof, the said Eastern Electric Manufacturing Company has hereto signed its name and affixed its seal the day and year first above written.

The words "and agreements" in the fourth line of seventh page having been first interlined. Also on page 3 the words, "and also the letters patent granted to William Edward Sawyer, dated and numbered as follows, viz: One dated November 19th, 1878, and No. 210,151; one dated September 16th, 1879, and No. 219,771; one dated February 8th, 1881, and No. 237,632," having been first written in the margin. And the words, "and all which belonged to it at the time of making said contract of June 10th, 1880," having been first interlined between the sixteenth and seventeenth lines on the sixth page.

THE EASTERN ELECTRIC
MANF'G CO.,
By HORACE LITTLE, *President.*
W. N. PEARNE, *Secretary.*

Signed, sealed and delivered in presence of—
WILLIAM H. CLARKSON.
JAMES M. SULLIVAN.

130 STATE OF NEW YORK, } ss:
County of New York, }

NEW YORK CITY, *Sept. 30th, A. D.* 1882.

Personally appeared Horace Little, president, and W. N. Pearne, secretary of the Eastern Electric Manufacturing Company, signers and sealers of the foregoing instrument, and acknowledged the same to be their free act and deed, before me, as the president and secretary respectively of said company, and the free act and deed of said company; and they also made solemn oath before me that they were the above-described officers of said company, and that the seal affixed to the foregoing instrument was the corporate seal of said company, and that it was affixed thereto by proper authority of said company, and that they signed their names thereto by like authority as the president and secretary of said company.

In witness whereof, I have hereunto set my hand and affixed my official seal this 30th day of September, A. D. 1882.

[SEAL.] WILLIAM H. CLARKSON,
Commissioner for Connecticut in New York, 117 Broadway, N. Y. City, and Notary Public for New York County, N. Y.

Received for record October 5th, 1882, and recorded in Liber J 28, page 441, of Transfers of Patents.

In testimony whereof I have caused the seal of the Patent Office to be hereunto affixed.

E. M. MARBLE,
Commissioner.

Ex'd: M. T.

COMPLAINANT'S EXHIBIT SAWYER AND MAN ASSIGNMENT OF APRIL 5TH, 1881. H. D. G., EX'R.

This deed of assignment, made this 5th day of April, 1881, by and between William E. Sawyer, of New York city, county and
131 State, and Albon Man, of Brooklyn, county of Kings and State aforesaid, of the first part, and the Electro-Dynamic Light Company, a corporation created and existing under and by virtue of the laws of the State of New York, of the second part.

Witnesseth: That whereas the said William E. Saw*p*er and Albon Man are the joint inventors of certain improvements in electric lighting, for which they have made and filed a joint application for letters patent of the United States, and which application was filed in the Patent Office January 9th, 1880, and which invention, by a brief instrument in writing, bearing no date, was assigned to the said Electro-Dynamic Light Company, said assignment having been recorded in the Patent Office January 9th, 1880, in Liber, W 24, page 380.

But whereas said assignment is not accompanied with sufficient covenants to enable said company to fully control said invention and to properly protect it with letters patent, the said Sawyer and Man, for the consideration mentioned in said assignment, and for other good and sufficient considerations, the receipt of which is hereby acknowledged, and with which they, jointly and severally, declare themselves satisfied, contented, and paid, hereby jointly and severally assign, transfer, and convey to the said Electro-Dynamic Light Company the whole of the said invention described, claimed, illustrated, or suggested in said application for said patent, together with all drawings, models, and papers appertaining to said inven-

tion and application for said patent; and also any and all patents that may be hereafter issued for said invention upon said application, or any subdivisions that may be made of said application, including any part or parts of said invention for the said Electro-Dynamic Light Company, its successors and assigns, to have, hold, and enjoy for its and their own use, benefit, and behoof through the whole of the term for which letters patent or patents may be granted, issued, reissued, or extended for the said invention or any
132 subdivision thereof, for, to, and in whole of the United States and the Territories thereof, as fully and entirely as the said William E. Sawyer and Albon Man, or either of them, might, could, or would have held and enjoyed the same jointly or severally had this assignment and transfer not been made.

And for the consideration aforesaid the said William E. Sawyer and Albon Man do hereby covenant individually, each for himself, with the said Electro-Dynamic Light Company that since the making and executing by them of said assignment of said invention, and said application for said letters patent for the same, they have not done or caused to be done, jointly or severally, any act or deed calculated or intended to defeat or encumber the title to said invention, or any letters patent that may be granted therefor.

And for the consideration aforesaid the said William E. Sawyer and Albon Man hereby covenants, each for himself individually, with said company that they will at any time hereafter, upon the advice of the counsel of said company, or the counsel for its successors or assigns, that the same is necessary for the better and more perfect enjoyment of said letters patent and invention by said company, execute any papers, drawing, or writing necessary to procure additional patents for said inventions, or which may be necessary to amend said applications or patents by reissue, disclaimer, or otherwise, as provided by law, and also any papers or writing that may be necessary to more fully vest the title to said inventions, or any letters patents that may be granted for the same unto said company.

And for the consideration aforesaid William E. Sawyer and Albon Man hereby declares, each for himself, that the purpose of this instrument is not to supersede any instrument of conveyance heretofore made by them to said company of said invention or application for letters patent, but is intended to confirm and supplement the same, and to supply any defect, deficiency, or omissions of said previous assignments, and to make and add such additional
133 covenants as are herein contained for the purpose of perfecting and enlarging the title of said company to said inventions, and any letters patent that may be granted therefor, and to enable it at any time hereafter to apply for any additional patents for said invention, or to reissue, disclaim, or otherwise amend those above specified as aforesaid.

And the Commissioner of Patents is hereby authorized and requested to issue any and all patents that may be granted for said inventions, or any part or subdivision thereof, to the said Electro Dynamic Light Company, its successor or assigns, as the assignee of the entire right and title of said Sawyer and Man, either jointly or severally, in and to the same.

In witness whereof the said William E. Sawyer and Albon Man have hereto set their hands and seals the day and year above written.

W. E. SAWYER. [SEAL.]
ALBON MAN. [SEAL.]

Witness:
AMOS BROADNAX.

Received for record April 18th, 1881, and recorded in Liber, N. 26, page 366, of Transfers of Patents.

In testimony whereof, I have caused the seal of the Patent Office to be hereunto affixed.

V. D. STOCKBRIDGE,
Acting Commissioner.

Ex'd: F. C. T.

134 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY *against* THE MCKEESPORT LIGHT COMPANY.	No. 5. May Term, 1888. In Equity. Suit on Letters Patent No. 317,676.

NEW YORK, *July 31st*, 1888.

Testimony taken before John H. Kitchen, Esq., one of the standing examiners of the circuit court of the United States for the southern district of New York, pursuant to a consent between the parties to the above-entitled suit, dated July 20th, 1888, and to an order made in the above-entitled suit dated July 28th, 1888.

Present: Mr. Thomas B. Kerr, for complainant; Messrs. John C. Tomlinson and Richard N. Dyer, for defendant.

Counsel for defendant produces a fac-simile copy of an article published in the "New York Herald" on December 21st, 1879, headed "Edison's light" and previously referred to in this suit and marked for identification "Herald article of December 21st for identification, H. D. G., examiner" (L. C. W., May 10th, 1888).

Complainant's counsel hereby stipulates on the record and agrees that the "New York Herald" is a newspaper published in the city of New York and largely circulated throughout the United States and that it was so published and circulated during and prior to the month of December, 1879.

135 Complainant's counsel further stipulates on the record that the paper referred to and marked "Herald article of December 21st for identification, H. D. G., examiner (L. C. W., May 10th, 1888)," is a correct and exact copy of an article published in the "New York Herald" on December 21st, 1879.

Complainant's counsel consents that the paper referred to may be offered in evidence with the same force and effect as though a copy of the "New York Herald" of December 21st, 1879, containing such article was offered in evidence and due and proper proof made of the publication of such article in the "New York Herald" and due and proper proof made that the "New York Herald" is a paper published and circulated in the city of New York and was so published and circulated during the month of December, 1879.

Defendant's counsel offer in evidence the paper marked "Herald article of December 21st for identification, H. D. G., examiner (L. C. W., May 10th, 1888)," and the same is marked Defendant's Exhibit Herald Article of December 21st, 1879.

GEORGE F. BARKER, a witness produced on behalf of the defendant, being duly sworn according to law and interrogated by Mr. TOMLINSON, testifies as follows:

1 Q. What is your name, age, residence, and occupation?

A. George F. Barker; age, 51 years; residence, Philadelphia; I am a professor of physics in the University of Pennsylvania.

2 Q. Please state what experience you have had as a scientist and the recognitions you have received as such and more especially with respect to the subject of electricity?

A. I went to Philadelphia in 1873 from Yale college, where I had held a professorship of physiological chemistry for several years. I had also been the professor of chemistry in several
136 other institutions previously. I am a member of the National Academy of Science and have been president of the American Association for the Advancement of Science. I was one of the commissioners of the United States at the Paris electrical exhibition of 1881 and a delegate to the International Congress of Electricians. I was also appointed by the Government a member of the United States electrical commission, in the fall of 1884.

3 Q. Please state how closely you have followed the advancement of the application of electricity to the useful arts, and more especially its application for purposes of illumination?

A. I have always taken a special interest in electrical matters and have made them a subject of instruction to my classes, and have been called as an expert in a great variety and number of cases involving their useful applications. I have attempted to keep myself informed of the progress of electrical science from the published literature on the subject, have always had an extensive collection of apparatus at my disposal for purposes of experiment and investigation, and have experimented variously in the applications of electricity to useful purposes, especially to electric lighting, for some years past.

4 Q. Have you read and are you familiar with and do you understand the invention described and claimed in letters patent of the United States No. 317,676, dated May 12th, 1885, the patent in suit?

A. I have read the patent referred to, and am familiar with it, and believe that I understand the invention described and claimed in such patent.

5 Q. Have you read and are you familiar with the article headed

"Edison's light," printed and published in the "New York Herald" on December 21st, 1879, which has been offered in evidence in this suit and is marked "Defendant's Exhibit Herald Article of December 21st, 1879"?

A. I have carefully read such article, and understand and am familiar with the statements and matter therein contained.

137 6 Q. Have you read and are you familiar with the following questions submitted to, and the following answers made by, Mr. F. L. Pope, who was called as an expert for the complainant herein, to wit, questions and answers 59, 60, 61, 62, 63, 64, 65, 120 and 121?

A. I have read the testimony of Mr. Pope, referred to, and am familiar with it.

7 Q. Please state whether, in your opinion, the "Herald" article referred to contains a complete and full description of the invention of the first, second, third and fourth claims of the patent in suit?

A. In my opinion the article referred to is a complete and full description of the invention described and claimed in the patent in suit and is a complete and full anticipation of the inventions of the 1st, 2d, 3d and 4th claims of that patent.

8 Q. Do you, then, agree with Mr. Pope that if the invention of the patent in suit was made on the day of the application, this publication would be a complete anticipation of it?

A. I agree entirely with Mr. Pope, and, to use his language, "I have no doubt it would."

GEORGE F. BARKER.

Direct examination closed.

138 *Complainant's Testimony in Reply.*

Testimony in reply on the part of complainant, taken herein pursuant to the 67th rule of the United States Supreme Court, in equity, as amended, before William T. Farnham, Esq., of the city of New York, special examiner herein.

NEW YORK, *November* 28, 1888.

Met pursuant to notice.

Present: Thomas B. Kerr, Esq., and Leonard E. Curtis, Esq., on behalf of complainant, and John C. Tomlinson, Esq., on behalf of defendant.

Testimony of Amos Broadnax.

AMOS BROADNAX, being called and duly sworn, testifies as follows:

Int. 1. What is your name, age, residence and occupation?

Ans. My name is Amos Broadnax. I am 61 years of age, I reside at 41 Jefferson avenue, Brooklyn. I am a lawyer by profession, engaged more especially in the practice of the patent law, and have been since 1856, having had my office since 1862 in the city of New

York, previous to that in Washington, and previous to that in St. Louis, Missouri.

Int. 2. When, and under what circumstances, did you first see an incandescent electric lamp?

Ans. To the best of my recollection, I first saw an incandescent electric lamp in June or July, 1878. The circumstances which led to my seeing the lamp are these: I met Mr. Albon Man, some
139 time in either of the months I have mentioned, on the corner of Nassau and Wall streets, in the city of New York, and he there told me about an electric lamp that he and Mr. Wm. E. Sawyer had invented and made. He invited me to come up to his office, No. 3 Mercer street, in New York, and see the lamp. A few days after that I called at Mr. Man's office, No. 3 Mercer street, and he there showed me the lamp, taking it out of his safe and showing and explaining it to me. He, thereupon, invited me to go with him to No. 2 Howard street, on the corner of Centre street, N. Y., to the workshop of himself and Mr. Sawyer, and see the lamp illuminated. I went with him, and there and for the first time I met and was introduced to Mr. Wm. E. Sawyer. After a little talk about patents, the lamps and electric lighting, Mr. Sawyer put the lamp on the lighting circuit, that had its source in the shop of Arnoux & Hockhausen, and the lamp was illuminated. Perhaps it will be proper to add in this connection, that I was at that time very well acquainted with Mr. Albon Man, having made his acquaintance in the latter part of the year 1868, and had obtained a number of patents for him or in which he was interested.

3 Q. Can you produce a lamp such as you saw at that time? And if so, please do it.

A. I have here in my possession an incandescent electric lamp, substantially such as was shown to me by Mr. Man at that time. This lamp, however, has not got the cup upon its base by which it was to be screwed on the fixture, as I think that lamp had. The lamp I am referring to is an exhibit in case 3472, between The Edison Electric Light Company and The Consolidated Electric Light Company, and also in case 3469, between the same parties, both in the southern district of New York. I have also a lamp in my possession which I now produce, which is substantially the same lamp as the one last referred to, differing from it, however, in the
140 manner of its sealing; otherwise, I don't think there is any substantial difference between the two lamps.

Said lamp is offered in evidence and marked "Complainant's Exhibit Broadnax Sawyer-Man Lamp No. 1, November 28, 1888."

Int. 4. When, if ever, did you next see a Sawyer-Man incandescent lamp, and if so, under what circumstances?

Ans. Some time in the fore part of October, 1878, Mr. Albon Man and William E. Sawyer came to my office and retained me as solicitor for the Electro Dynamic Light Company, a New York corporation, more especially to take out some patents for improvements in incandescent electric lamps, the inventions of Sawyer & Man. I then again saw, within a few days after that, a number of their incandescent electric lamps, and I prepared applications for patents for the inventions, or a part of them, that were then brought to me, and drew an assignment dated October 14, 1878, of some of those inventions to the Electro Dynamic Light Company, which assignment is in evidence in this case as Complainant's "Exhibit Sawyer-Man Assignment of October 14, 1878."

Int. 5. Please describe the lamps you then saw.

Ans. I saw then, or about that time, say between October 15 and November 15, at their works on the corner of Walker and Elm streets in New York, two practical types of lamps. The one type is illlustrated in patent 210,809, granted to Wm. E. Sawyer and Albon Man; the other is fairly illustrated, although not exactly so, in the drawing of the patent in suit; the principal difference between the two lamps, being in the form and substance of their illuminants. In the one case, the illuminant was a straight pencil or filament of carbon, and in the other case, the illuminant was in the form substantially of the letter U. In this case the absolute continuity of the circuit was maintained, both ends of the illuminant being permanently connected to the leading- in conductors of the lamp. In the
141 other case, I mean the case of the straight pencil or filament,
only one end is fixed, that is, clamped to the leading-in conductor, the other end being held in contact with the conductor by means of a spring or weight.

6 Q. Can you state what material the illuminants of these lamps was composed of?

A. The illuminants were composed of carbon in both cases; the straight carbons were composed of what is known as treated carbon, or pure-deposit carbon, that is, carbon produced by treating the illuminant electrically in the presence of a *d*ydrocarbon gas or fluid. In some cases the original pencils was made of some fibrous material cut to size, carbonized and then treated as described in the patent to Sawyer & Man, 211,262, the fibrous part of the carbon being afterwards removed, leaving a straight shell either in the form of a tube, or in the form of a trough of pure-deposit carbon. In the other case, the carbon was made of paper cut to size and shape and then carbonized, and more or less treated by the process of the patent I have mentioned, and then put in the lamp. It must be understood, however, that in neither case did I see these carbons put into the lamp, but I frequently saw the carbons treated, I saw the blanks, in the case of paper, out of which they were made, and I saw these blanks after they were carbonized; that is to say, I saw blank illuminants taken out of the box in which they had been carbonized, and I saw them treated, but I don't remember that I ever saw any put in the lamp, but I saw the lamp with the carbons in them, and which I was told by both Sawyer and Man were the carbons about which I have been testifying, and I have every reason to believe, acting as I was in a confidential relation to those gentlemen, that they were the same carbons that I had seen, as I have already stated.

7 Q. What do you mean by the expression, "put into the lamp"?

142 Ans. When I say "put into the lamp," I mean that I did not see the illuminant put in the lighting circuit, and the lighting circuit put in the lamp. In short, I did not see the lamp made, but did see the different parts of the lamp before they were assembled, and did see them after they were assembled, but did not see them being assembled. I saw these carbons, nevertheless, in the electric circuit while they were being treated and prepared for use in the lamp. I desire to add, also, that in the case of the straight pencil it was a common practice for them to make the illuminant by simply treating it slightly, preparatory to using it in the lamp, leaving the fibrous carbon intact as a part of the illuminant.

Int. 8. State how often, and how many of these Sawyer-Man lamps with arch-shaped carbons made of paper or fibrous material you saw in use during the period from November, 1878, to December, 1879?

Ans. During the month of November, 1878, I saw a number of these lamps at the works of Sawyer & Man, or the Electro Dynamic Light Co., rather, at the corner of Walker and Elm streets; just how many I cannot say. I have a very distinct recollection of seeing in November, 1878, two of these lamps suspended from a chandelier hanging in the center of the room very brilliantly illuminated, and in addition to these central lamps, there were, I think, either three or four, perhaps more, set in brackets around the room, of the same lamps. I saw these lamps there, I can't say now how many times, but quite often. Sometimes they would be illuminated and sometimes not, when I went there. It is impossible for me, after so much time has elapsed, to state how many times I saw those lamps as well as other lamps.

Int. 9. How did the lamps mentioned in your last answer operate when you saw them in use?

Ans. The practical operation of the lamps was perfect, so far as I was able to judge; I could see no defects in the operation of 143 the lamps, nor did I hear of any. The luminosity of the lamps was very high, ranging, I should say, from thirty to fifty candle power. There was no break in the operation of the lamps during the time I was there.

10 Q. How did their operation compare with the operation of the incandescent electric lamps in common commercial use at the present time?

A. As to that I can only testify as to their operation during the time that I saw them. During the time that I saw them their operation was as perfect as any lamp of to-day, that is, their light-giving quality or power. Whether they were as economical as the lamp of to-day I don't know, but in so far as their function of giving a steady bright light is concerned, they were equal to any incandescent electric lamps I ever saw from that time to this.

11 Q. It seems to me that you have not fully answered my question 8, as to the number of these lamps that you saw. Please do so now.

A. I saw a number of lamps as I have stated in November, and I think also in December, 1878, and possibly in January, 1879, but as to January, I am not clear or certain of seeing any of these lamps in operation, but I think I saw some of these lamps in operation in November or December, 1879, at Mr. Sawyer's house in 54th street, I think it was 54th street, I am not certain as to the number of the street, but I think it was 54th street or in that neighborhood. Mr. Sawyer had a number of these Sawyer-Man lamps there on exhibition, and some of them I think were these hoop carbon lamps. As to the number of these lamps that I saw, I cannot tell how many of them I did see.

Adjourned till 2½ p. m.

Resumed after adjournment.

144 12 Q. Please describe the apparatus and operation of treating the fibrous material or blanks from which the illuminants were made, as far as you obtained knowledge of the same from seeing the apparatus and operation?

Ans. The apparatus used in treating these carbons, or rather a portion of it, I now produce. The apparatus as a whole consisted of a large lamp chamber. I mean by that the globe of a lamp which was made of glass. To the bottom of that chamber a disc of glass was ground and sealed. On the inside surface of this disc was placed two electrodes, secured by tubular pieces of metal passing through and sealed into the disc. The two electrodes raised up above the disc side by side, were somewhere about eight inches in length. The top ends of these electrodes were connected to the bottom side of a soapstone disc through which two holes were bored, in which were inserted studs, the tops of which were made in the form of clamps. In these clamps the two ends of the carbon to be treated were secured so as to complete the circuit in the lamp, the clamping studs passing through the soapstone disc and uniting the conductor below the discs in the circuit, the two conductors being of course separated and insulated from each other so as to make a complete electric circuit. The globe of the apparatus was filled with hydrocarbon gas or fluid. I think gas was used when I saw it in operation. The electric circuit was then connected to the tubes, and the current sent through the carbon while it was immersed in the gas, and was continued until the carbon was treated to the degree required, the carbon being raised electrically to high incandescence. The globe of the apparatus I have not got, but I have got the glass discs with the two electrodes set thereon united to the soapstone disc and the clamping studs, and I now produce it.

Int. 13. Please describe the apparatus and operation of carbonizing the fibrous material or blanks from which the illuminants were made, as far as you obtained knowledge of the same from seeing the apparatus and operation?

145 Ans. I do not know that I can describe with much minuteness the retort in which the carbons were made. I mean, of course, the paper carbonized, but a general description of it is this: It consisted of an iron or clay retort, as I should judge,

about four inches long and two inches or perhaps two and a half inches in diameter. This retort was taken out of the furnace of the steam boiler used to drive the machinery in the Walker and Elm streets shops. It was quite hot when I first saw it or when it was brought into the exhibition room, and it was allowed to cool down there sufficiently to enable them to open it. I think Mr. Wm. Sawyer (Dr. Wm. E. Sawyer's father) who was employed there, and who was a machinist by trade opened it. After he opened it, he called my attention to it. He said: "Here Mr. Broadnax, you can see what these carbons are like." I went to him and together we looked at them, he taking them out with a piece of wire and showing them to me. I did not see the paper blanks put in the retort, but I understood from him that the retort was first charged with a layer of powdered carbon, which was pressed down to a smooth surface upon which the material to be carbonized was laid. This material was covered over with a layer of powdered carbon, and pressed down as in the first instance. Another course or layer of the material to be carbonized was then put in the retort, and another layer of carbon was put in and so on till the retort was full. It was then covered with a lid, which was fastened. Just how it was fastened I cannot tell, as I did not observe the thing in detail especially. What I was interested in most was to see the carbons as they appeared when they came out of the box.

Some of the carbons when they came out were quite hard, dense, smooth and strong. Some of them were soft and only partially carbonized, and as I should say, scarcely fit for use, but they were sufficiently carbonized, as Mr. Sawyer explained to me, to enable him to get a current through them in the treating apparatus. I think old Mr. Sawyer told me in response to my question as to how hot he had made the retort in which the carbons were contained,
146 that they had heated it up as high as they could in the furnace of the boiler, and then put it in the ash pit and covered it with ashes until it was cooled down to the condition it was when he brought it in, which was scarcely a dull red heat. Some parts of it were not red hot. I recollect asking him if he could get heat enough in the boiler furnace to make perfect carbonization. He replied that he did not, and that that would account for the imperfect condition of some of the carbons.

Int. 14. State how these paper carbons compared with those you saw in the lamp, in appearance.

Ans. They were the same in appearance, but there was a great variety of shapes.

Int. 15. Please state what these great varieties of shapes were.

Ans. Some of them were straight pieces of carbon, slips or filaments cut from drawing paper, I should say. I say that, because the pieces that I saw that were not carbonized, were pieces cut from drawing paper. Some of them were in the form of a circular washer, a complete ring having a small section broken out: some of them were in the form of a bow or loop of irregular form, like that shown in the sketch I now make and produce.

Said sketch is offered in evidence and marked "Complainant's Exhibit Broadnax Sketch, Nov. 28, 1888."

(Here follows diagram marked p. 147.)

Int. 16. Did you see any lamps at that time, viz: October, November or December, 1878, in which the fibrous carbon illuminant was made of any other material beside paper?

Ans. I cannot be certain that I did. There was a good deal of talk there between Mr. Man and Sawyer and I about carbons made of all sorts of fibrous material, but I don't recollect of seeing lamps in which carbons made from such fibrous material were used; I have a very distinct recollection of seeing the paper carbons, and of talking about the others.

148 17 Q. What other materials do you refer to?

A. Broom corn and willow twigs, the fibre of the twigs and a great variety of wood that Man told me about, the names of which I cannot now undertake to repeat, hemp, manilla and cotton thread was especially mentioned, I recollect that. I cannot say now that I saw any of these materials carbonized or used in the lamps.

18 Q. Can you produce a lamp such as you saw used in 1878, by Sawyer and Man, having a fibrous carbon illuminant, and if so, please do it.

A. Yes. The lamp I now produce, or substantially such a lamp. The two ends of the bow-shaped illuminant are slipped down in the divided ends of the carbon-holders of this lamp and were fastened in there by some sort of carbonaceous cement, I don't know what the cement was made of. The bow or arch of the illuminant projecting above the holders.

The lamp referred to is offered in evidence and marked "Complainant's Exhibit Sawyer-Man Broadnax Lamp No. 2, Nov. 28, 1888."

19 Q. State what you know of the history of the two lamps now in evidence. "Exhibits Broadnax Sawyer-Man Nos. 1 and 2?"

A. The two lamps referred to in the question were given to me by Albon Man, I should say from six to eight months to a year ago, to be used as exhibits in the case of The Consolidated Electric Light Co. *vs.* The Edison Electric Light Co. and Thomas A. Edison, in the southern district of New York, a suit founded on the patent in suit here, and I have had them in my possession ever since, and I recognize them as the same lamps or substantially the same lamps, that I saw in the laboratory of the Electro Dynamic Light Co., in the fall of 1878, as I have testified.

The portion of the treating apparatus referred to by the witness in answer to 12 Q. is now offered in evidence as "Complainant's Exhibit Sawyer-Man Treating Apparatus, Nov. 28, 1888."

149 Int. 20. State whether you were at any time requested by Sawyer & Man, or either of them, to apply for a patent on

No. 286
C. E. Light Co.
v

S. E.

the fibrous-carbon illuminant, and if so, please give all that occurred in regard to the same?

Ans. Two or three days previous to October 14, 1878, Sawyer & Man came to my office and brought the inventions mentioned in the assignment, dated Oct. 14, 1878, to me to patent for the Electric Dynamic Light Co., as inventions of theirs, and Mr. Man more especially requested in the presence of Mr. Sawyer, and to which Mr. Sawyer assented, that those inventions should at once be conveyed to the Electro Dynamic Light Co., and that I should then proceed to patent them, and I accordingly did proceed, and drew the assignment, and at once prepared an application for a patent for two of the inventions mentioned in that assignment, viz.: the "improvement in electric-lighting apparatus and circuits," and also for the improvements in the "treatment of carbons to be used for electric lighting." The preparation of the application for the carbons themselves was temporarily deferred until I could have time to consider the best form to put the application in. I mean, of course, the invention of the bow or U-shaped carbon made of paper or other fibrous material. The application for the lighting circuits and apparatus, and for the process for treating carbons was filed as soon as I could prepare them, which was within a week probably. The preparation of the application for what we now call the fibrous-carbon conductor, making the subject-matter of the patent in suit, was deferred at first because I was in doubt as to the patentability of some of the features that Sawyer & Man wanted to claim. The feature about which I was in doubt, and about which they were very tenacious, was the making the incandescent conductor of paper or other fibrous material. I had no doubt about the patentability of the loop form of the carbon conductor in combination with the lighting circuit in the lamp, believing as I did, and as they did
150 at that time, that such a form of conductor was new, irrespective of the carbon of which it was made; but whether the incandescent conductor made of fibrous or textile material irrespective of its form or combination was a patentable invention, was a question about which I had my doubts, and I took a good deal of time to think about it and to make up my mind as to the best form to put it in, and whether if such a patent could be obtained, it could be sustained. Upon this subject I had a good many interviews with Sawyer and Man, and we discussed the subject in its various aspects under all the light that we had at that time upon the matter. Mr. Man and Mr. Sawyer and myself, respectively, drew a good many different forms of claims to cover that invention. Finally, I drew a complete specification of the invention in lead pencil on buff drafting paper at my house in Baltic street, Brooklyn, Mr. Man having become very solicitous and urgent in having me prepare such an application. After the specification was prepared I took it over to Mr. Man's office, No. 3 Mercer street, going directly from my house to his office. Mr. Man took the draft of the specification in his hand and glanced over it, but was so much occupied with the business of his office that I could not get his attention. He told me to take the paper to Sawyer and go over it with him. I took

the paper, going directly from Man's office to Sawyer's office, which was then in Walker street, and tried to get Sawyer to read it over with me, but he was busy writing a paper of some sort and would not take the time to go through the specification and discuss it with me, but said he would take the paper and read it and amend it, if necessary, so as to convey his thoughts, and return it to me. I explained to him that the paper contained probably more than it ought to contain in some aspects of it, and in some it probably did not contain enough, and I specially requested him to write in and strike out what he thought would be proper, he being then, or was
thought to be, a very good electrician, and I having very lit-
151 tle knowledge of the subject. I left the paper with *ject. I*
left the paper with him, and I have never seen it since. This took place, as I think, in April, 1879. At all events, it was just before Sawyer went to Ansonia to superintend the making of the Sawyer & Man lamps at the works of Wallace & Sons. During that same summer I went to Ansonia on a visit to the works of Wallace & Sons, along with Thomas Sault, an engineer of New Haven, and while there I met Mr. Sawyer and asked him if he had revised the specification that I had given him. He said he had not, but that he had read it over, and would give it his attention as soon as he could get time. I do not recollect of ever having spoken to him about the paper afterwards, nor do I remember his mentioning the paper to me afterwards. In fact, I did not see Mr. Sawyer again until quite late in the fall, either in November or December, 1879, when he was engaged in an effort to organize the Eastern Electric Manufacturing Company, and had become bitterly hostile to the interests of the Electro Dynamic Light Co. I went to see him either in November or December at his house, I think, which was in 54th street, New York, where he was engaged in making an exhibition of the Sawyer-Man lamps, as a part of his scheme in organizing the Eastern Electric Manufacturing Co. I went there, I think, with Albon Man to get him to execute some papers, which he refused to do. What the papers were that I took to him for his execution I do not now remember, but they were some papers in the interest of the Electro Dynamic Co., which he very positively and peremptorily refused to execute. After that I don't think I saw Mr. Sawyer or had any intercourse with him till after the organization of the Eastern Electric Manufacturing Co. and the assignment of the patents of the Electro Dynamic Light Co., known as the Sawyer-Man patents, to the Eastern Electric Manufacturing Company.

Adjourned till Tuesday, the 4th day of December next, at 11 a. m.

152 TUESDAY, *December 4th*, 1888—11 a. m.

Met pursuant to adjournment and adjourned till 2½ p. m.

2½ P. M.

Met, present counsel as before, and the examination of Mr. BROADNAX proceeded as follows:

21 Q. You have referred to an assignment dated October 14, 1878,

which is in evidence as "Complainant's Exhibit Sawyer-Man Assignment of October 14, 1878," please state whether any of the inventions referred to in that assignment were patented, and if so, give the number and dates of such patents.

A. Yes, there were. Two of them were patented immediately. The first patent is entitled "Improvement in switches for electric lights," and is numbered 210,152, and is dated November 19, 1878. The application for that patent was filed October 15, 1878, and in the first paragraph of this specification the invention is described as "certain new and useful improvements in electric-lighting apparatus and circuits," the same as in the assignments referred to. The second invention is entitled in the assignment as "Carbon for electric lights." For that invention the application was not filed until January 9, 1880, and the patent is dated and numbered as follows: May 12, 1885, No. 317,676, the same being the patent in suit. The third invention which was conveyed by that assignment was for a novel process of treating carbons for electric light. The application for that patent was filed October 15, 1878. The patent is dated January 7, 1879, and is numbered 211,262. These three inventions were all conveyed by Sawyer and Man to the Electro-Dynamic Light Company by the assignment mentioned in the question.

153 Int. 22. There is an assignment in evidence called "Complainant's Exhibit Sawyer-Man Assignment of January 9, 1880;" can you state the purpose of that assignment, in view of the fact that the invention therein conveyed is in accordance with your last answer, one of those conveyed by the assignment of October 14, 1878?

Ans. I did not draw the assignment referred to in the question, but I was present when the assignment was executed by Albon Man, and I understood from him at that time, that the object of that assignment was to authorize the Commissioner of Patents to issue the said patent to the Electro Dynamic Light Company as the assignee of Sawyer & Man, which the assignment of October 14, 1878, omitted to do.

Int. 23. What was the attitude of Sawyer to Man and to the Electro Dynamic Light Company during the period from November, 1878, until December, 1879?

Ans. As I understood it, from my intercourse with them, the relation between Sawyer and Man was quite friendly in November, 1878. In December of the same year, the relations between Sawyer and Man as individuals, and between Sawyer and the Electro Dynamic Light Company became somewhat strained, on account of the intemperate habits of Mr. Sawyer. In January of 1879, about the same strained condition continued, but perhaps growing a little more pronounced, and it continued in that way until March, 1879, when the Electro Dynamic Light Company and Mr. Man, who was president of that company, determined to close their shop or laboratory of which Mr. Sawyer was the superintendent. Mr. Sawyer then, or about that time, as I understood it, demanded of the Electro Dynamic Light Company a license or right to work under all their patents, which the company, as I understood it, refused to give him;

but shortly after that, or about that time, as I now remember, an arrangement was made with Wallace & Sons to manufacture
154 the Sawyer-Man lamp, under the supervision of Mr. Sawyer at the workshop of Wallace & Sons at Ansonia, Conn. Mr. Sawyer, in performance of this arrangement, went to Ansonia and had under his supervision a lot of lamps manufactured. I saw Mr. Sawyer at the works of Wallace & Sons in the summer of 1879, I think it was June or July. I talked with him about the lamps in a general way, and about the Electro Dynamic Light Company. Sawyer during that interview, while he did not say anything that was pronounced, against Mr. Man or the Electro Dynamic Light Company, seemed to me from his conversation to be restless and dissatisfied with his position there. From that time on, until some time in November or December, 1879, I don't recollect of seeing Mr. Sawyer, but at the time last mentioned, I in company with Albon Man visited his house, which I think was in West 54th street, west of Sixth avenue. I went up there with Mr. Man and took some papers with me, in the interest of the Electro Dynamic Light Company for Mr. Sawyer to execute. What those papers were, I cannot now be certain, but my impression is, that it was an application for the reissue of the Sawyer-Man patent No. 205,303, dated January 25, 1878. I recollect that I had been instructed by the Electro Dynamic Light Company to prepare an application for the reissue of that patent and I think it was that application that Mr. Man and I went to get Mr. Sawyer to execute at the time mentioned. Mr. Man solicited in my presence Mr. Sawyer and urged him in a friendly way to execute the paper, which Sawyer refused to do. I afterwards, on the same occasion, when Mr. Man was not present, urged upon Mr. Sawyer the importance of executing the paper. Mr. Sawyer replied that he had considered all that, and said he would be "damned if he would execute any papers in the interest of the Electro Dynamic Light Company." I don't recollect of having any further intercourse with Mr. Sawyer until the time the negotiations were pending about the transfer of the patents of the Electro Dynamic Light Company to the Eastern Elec-
155 tric Manufacturing Company, which was in the early part of April, 1881.

Int. 24. Did you during the period between the time you prepared the specification which you gave to Sawyer, in December, 1879, make any effort of any kind to get the application for the patent in suit executed?

Ans. I have already stated that I never saw the draft of the specification for a patent of the invention covered by the patent in suit, after I gave it to Sawyer, just before he went to Ansonia, but at the time I saw Mr. Sawyer at the works of Wallace & Sons, in Ansonia, I asked him why he did not revise the specification I had given him and send it to me that I might perfect the application for the patent; to which he replied, that he had been very busy in getting the work at Ansonia started, meaning the manufacture of the lamps, and had had no time to do anything else, but he said he would look the paper up and go through it and send it to me. From that time I did not see Mr. Sawyer again till November or December, as I have mentioned, and I do not remember to ever have spoken again to him about that paper; I have an impression that about the time that I visited Mr. Sawyer with Mr. Man in November or December, 1879, at 54th street, that Mr. Man asked me about the application for a patent of the invention of the patent in suit, referring to the draft of the specification I had given to Mr. Sawyer, at which time I think I told him of my interview with Mr. Sawyer at Ansonia. After that I don't recollect of my saying anything further to Man on the subject, or he to me, until the Sunday morning succeeding the publication in the New York Herald of an article describing Mr. Edison's invention of his electric lamp, and the use of the fibrous or paper carbon. I found Mr. Man is his office, very much engaged with people upon the business of his office, and did not get an interview with him of more than a few minutes. I called his attention to the article in the Herald, and urged upon him the importance of the getting in the Patent Office an application 156 for the invention in question at the earliest possible moment. He replied that he was busy in carrying on some negotiations which he hoped would result in an application for the patent in question. That, I think, is the last interview I had with Mr. Man upon the subject, until the day the application for the patent in suit was executed at the office of Charles A. Cheever.

25 Q. What description, if any, did Sawyer and Man give you of their improved lamp, having the fibrous-carbon illuminant, at the time they first spoke to you about it, including the time when you first saw the lamp in operation?

A. The lamp they described to me, and a sample of which they brought to my office, was, as I now recollect it, exactly like the lamp "Complainant's Exhibit Sawyer-Man Broadnax Lamp No. 2," but in the lamp that they showed me there was set in the top of the two electrodes an arch-shaped carbon, one end of the arch of said carbon being set in one of the carbon electrodes that appears in this lamp, and the other end of said arch in the other of said electrodes. Whether this lamp was brought to me on the day that the assignment of Oct. 14, 1878, was made, or whether it was brought to me a few days after that, I cannot now remember; but I am clear that it was either at the time, or within a few days after that, that a lamp like this was brought to me, and I think with it was brought the lamp that is illustrated and described in their patent 210,809, and the distinction between that lamp and this was pointed out to me, as was also the advantage of this lamp over that, in that the connection between the electrodes and the two ends of the illuminant was a fixed close union of the two parts of the circuit, by which the possibility of the formation of the electric arc at the junction between the illuminant and the electrodes was avoided. The method of sealing the lamp, and of exhausting and filling the chamber of the lamp was also explained to me, as was also the method of making contact between the lamp and the lighting circuit in which it 157 was to be set. I do not see that I can describe any better or more accurately the method of making, sealing, exhausting, and filling of the lamp of the patent 210,809 than it is described in that patent; and this lamp, I mean the "Exhibit Sawyer-Man Broadnax Lamp No. 2," last referred to, was made, exhausted and charged precisely as was the lamp of patent 210,809; differing from that, however, in its interior construction, by leaving out of the chamber of the lamp all of its machinery excepting the leading-in conductors and the soapstone disc fixed to the top of said conductors. In place of the machinery above the soapstone disc in patent 210,809, the inventors used in this lamp two straight studs, in the top of which the arch-formed carbon made of paper was set and cemented with some sort of carbonaceous cement. The bottom end of the globe of the lamp was ground upon a glass disc and was fastened and sealed substantially as shown and described in patent 210,809 and in the patent in suit. The inventors at the time explained to me that they had used in the chambers of their lamps a vacuum in place of the gas or gases described in the patent 210,809. This was in response to a question of mine, why they did not use a vacuum in the chamber of their lamp instead of the gases; to which they explained that they had used a vacuum, and that it answered first-rate when they could get a good vacuum, but they had no pump with which they could get a vacuum that was at all effectual, as a rule, in the construction of their lamps, and that they had, therefore, adopted an atmosphere of pure nitrogen for the interior of their lamp, which atmosphere they could make more or less attenuated as practice might seem to require, to ensure a satisfactory lamp.

Adjourned till Wednesday, the 5th inst., at 11 a. m.

158 WEDNESDAY, *December* 5, 1888.

Met pursuant to adjournment. Present, counsel as before, and the examination of Mr. BROADNAX continued as follows:

Int. 26. State whether or not, in your intercourse with Sawyer and Man, or either of them, you observed any want of appreciation on their part of the value and importance of the invention of the patent in suit.

Ans. No, I did not; on the contrary, they expressed a very high estimate of its value, and Mr. Man was especially enthusiastic over it, and was very persistent in claiming a patent for it in the broadest language, both in the presence of Mr. Sawyer and in his individual interviews with me, and urged upon me the importance of getting the specification in good shape, and getting the application for the patent filed.

Int. 27. What, if anything, did you know of Sawyer's habits of sobriety, and their effects on his conduct during this period?

Ans. Mr. Sawyer was intemperate in his habits when I first made his acquaintance, and his habits in this particular grew worse up to the time he died. At intervals he would be sober, reasonable and manageable, and then again at intervals he would be half or wholly intoxicated, capricious and utterly unmanageable, and do and say all sorts of foolish and extravagant things. It was that, as

I understood it, that led to the disruption between him and Man, and to the closing of the workshop or laboratory of the Electro Dynamic Light Company, and to his dismissal from the works of Wallace & Sons at Ansonia. As solicitor for the Electro Dynamic Light Company, I was frequently brought in contact with Mr. Sawyer and know of my own knowledge how very capricious he was. One day he would talk a thing up, and the next day he would talk the same thing down. From what I knew of my own knowl-
159 edge, and from what I heard of Sawyer from others, in a general way, I made up my mind, and frequently told my clients, that notwithstanding Sawyer's great reputation as an electrician, it was utterly impossible to carry on any business enterprise with him at the head of it, or in any controlling position.

Adjourned till Thursday, to-morrow, 6th inst., at 11 a. m.

THURSDAY, *Dec.* 6, 1888.

Adjourned till Monday the 10th inst., at 11 a. m.

MONDAY, *Dec.* 10, 1888.

Attended and adjourned subject to new notice.

TUESDAY, *Dec.* 18, 1888.

Met pursuant to annexed notice. Present, Thomas B. Kerr, Esq., on behalf of complainant, and Richard N. Dyer, Esq., on behalf of defendant, and the taking of testimony herein was adjourned till January 7, 1889, at 11 o'clock a. m.

MONDAY, *Jan.* 7, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX by Mr. DYER proceeded as follows:

The following objections to questions and answers are made by counsel for defendant, with the consent of counsel for complainant, that said objections shall have the same force and effect as if made on the conclusion of said questions and answers, respectively.

6 A. What was told the witness by Sawyer and Man, objected to as hearsay.

8 Q. Objected to as assuming that the witness has testified that he saw lamps having carbons of paper or fibrous material.

13 A. What the witness says as to the material that was put into the retorts, and what the carbons that came from the retorts were made from, and how the retorts were packed and how or
160 where the carbonizing was done, and whether there was any carbonizing done by means of the retorts, objected to as hearsay.

16 A. Talks between Man and Sawyer, objected to as hearsay.

17 Q. Objected to as calling for hearsay.

17 A. Objected to as hearsay.

25 Q. Objected to as containing hearsay testimony so mixed up

with pretended statements of facts as to leave it uncertain as to which are facts and which hearsay.

Cross-examination *de bene esse*, without waiving objections:

28 X Q. Did you not on the 17th day of March, 1881, testify as a witness for Sawyer and Man in an interference case with Thomas A. Edison, involving the application of Sawyer and Man, upon which the patent in suit was subsequently issued?

A. I testified as a witness in an interference between Sawyer and Man and Thomas A. Edison, on the day in which was involved the application for the patent in suit. On what day, I don't recollect, but the record will show on what day the testimony was given, and what the testimony was.

29 X Q Was not the application of Sawyer and Man involved in that interference, the application on which the patent in suit was subsequently issued?

A. Yes.

30 X Q. Have you not records or memoranda in your office by which you can refresh your recollection as to the date when you gave that testimony?

A. I have what purports to be a printed copy of the record in that interference; I have no other memorandum in writing by which I could determine that date. It appears by that record that my deposition in that case was given on the 17th of March, 1881.

161 X Int. 31. You were acting as the attorney for Sawyer & Man in taking the testimony in the interference case, were you not?

Ans. I was.

X Int. 32. And you then produced yourself as a witness on behalf of Sawyer & Man to establish, so far as you knew, the facts of their claim to priority of invention upon the use of carbonized paper as the conductor for an incandescent lamp?

(Objected to as incompetent, as not cross-examination, and as not the best evidence, the production of the interference record being the proper evidence of the issue involved in said interference and the nature and object of the witness' testimony in such case, as the same may appear by the production of his deposition referred to.)

Ans. On the earnest solicitation of my client, Mr. Man, I gave the deposition referred to for the purpose of establishing the fact that Sawyer & Man made and used an incandescent conductor for an electric lamp in the fall of 1878.

X Int. 33. Was that the only object of your deposition in the interference?

Ans. The only object that I remember now. Generally, the object of my deposition, and that of the other depositions in the case, was to establish priority of invention in Sawyer & Man upon the issue involved in the interference.

X Int. 34. How would your testimony "that Sawyer & Man made and used an incandescent conductor for an electric lamp in the fall of 1878" help the case? Was the issue as broad as that?

(Objected to as incompetent, as not calling for the best evidence in regard to what the issue of the interference was.)

Ans. I have not got the record before me, and cannot,
162 therefore, swear what the issue was. I can only give you my best recollection of it. As I recollect it, the claim that was made the subject-matter of the issue was an incandescent conductor for an electric lamp formed of carbonized paper. How far my testimony went to support priority of invention in Sawyer and Man on that issue will appear by the record.

35 X Q. Your object in giving the deposition, however, was to assist in the establishment of priority of invention in behalf of Sawyer and Man by means of such facts as were within your own recollection?

(All after "Man" objected to as an assumption, and forming no part of the question.)

A. I take it for granted that that was my object, for I can see no other object that I could have had in making that deposition.

36 X Q. In that interference case you testified as follows, did you not?

"Immediately after November 5, 1878, I was at the shop of Sawyer and Man on the corner of Walker and Elm streets, in this city, in consultation with them about certain applications for patents which I was then preparing for them: that while there I saw illuminated an electric lamp substantially like that illustrated by the drawing "Sawyer Exhibit No. 4." The lamp was fitted with a section of carbon in the lighting circuit, that being the illuminating part of the lamp. The section of carbon was U or arch shape, resembling the letter U inverted. The carbon was held between the divided ends of the metallic part of the circuit in the lamp by clamps like that shown in the drawing. Mr. Sawyer told me that the section of carbon in the lamp, being the illuminating part of it, was made of paper, and expressed the determination to get a patent for it. Whether the carbon was made of paper or not, I do not know. I did not see it made nor did I have the carbon in my hand. The lamp was sealed up and in place and illuminated. I was probably in the shop half an hour—certainly not
163 more than that talking with Mr. Sawyer about his lamps and his carbon, while I was there Mr. Sawyer arranged the light so as to throw a shadow of it on a screen to show me that that form of burner cast no shadow. Mr. Broadnax adds that he was solicitor for the Electro Dynamic Light Company at that time, and was consulting Mr. Sawyer upon the subject of patents for which he was then applying, and fixes the date which he has mentioned of the time he called there by the date of the application for the patent 210,809, which application was prepared and filed by me."

(Objected to as incompetent, irrelevant and not the best evidence.)

Ans. I do not know whether I did or not. I swore to something to that effect, speaking in a general way. I cannot swear at this time what I stated then.

X Int. 37. Have you any doubt of it?

(Same objection.)

Ans. I have no doubt that what I signed and swore to at the time was the truth, but what that was I do not know now, excepting as it appears in the record which I have not got. I will be very glad to verify my statement in the record if you will present it.

X Int. 38. As a matter of fact, you examined your deposition in the interference case just before or at the time of giving your direct examination in this case?

Ans. No, I did not.

X Int. 39. When did you examine it last?

Ans. I cannot tell you exactly the date, but it was some time after my examination-in-chief here in this case.

X Int. 40. Then your direct examination in this case was given without refreshing your recollection by referring to what you testified to on the same subject-matter nearly eight years ago in the interference case?

(Objected to because it don't appear that the alleged testimony of the witness was about the same subject-matter.)

164 Ans. Yes. The facts about which I testified upon my examination-in-chief here have been kept so fresh in my mind since they occurred that I had no difficulty in stating them without refreshing my memory by reading up the deposition referred to. I did not even think of it until my examination-in-chief was concluded.

X Int. 41. Have you not in your possession memoranda by which you can refresh your recollection as to what you did testify in the interference case?

(Objected to as incompetent.)

Ans. I have only what purports to be a printed copy of the interference record in my possession.

X Int. 42. Have you not a certified copy of that record?

Ans. No, not now.

X Int. 43. Where is the one you did have?

Ans. In the possession of the printer.

X Int. 44. Have you not in your possession copies of the printed record which you retained as attorney for Sawyer & Man in the interference case.

(Objected to as incompetent.)

Adjourned for lunch.

Resumed after lunch.

Ans. I have not: although since our adjournment I have looked through my papers in that case. My recollection is that the last copy I had of that interference case I sent to the Patent Office to be certified as a part of the interference record.

X Int. 45. Are you not the solicitor for the complainant in a suit pending in the southern district of New York on the same patent against the Edison Electric Light Co. and Thomas A. Edison, commenced in 1885, after the issue of the patent in suit No. 35531 in equity?

Ans. I am.

X Int. 46. And is it not a fact that in that case, as solicitor
165 for the complainant, you have taken hundreds of pages of
testimony in order to carry back the date of the invention
by Sawyer and Man to a date anterior to the filing of the application?

Objected to as incompetent.

A. It is a fact that I have taken hundreds of pages of testimony in that case to prove, among other things, that Sawyer and Man made the invention, the subject of the patent in suit, long before the application for the patent was filed. Perhaps it would be nearer accurate to say that hundreds of pages of testimony have been taken, most of which is cross-examination, about matters not pertinent to the issue.

47 X Q. And in that case you put in evidence, did you not, a duly authenticated copy of the record in the interference case, including the record in your deposition given in March, 1881?

A. I did put in what purports to be a certified copy of that record, and I presume it contains or includes a copy of the deposition referred to in the question.

48 X Q. Has the record of that case yet been filed in the clerk's office?

A. No, the record is not completed.

49 X Q. It is a fact still in your possession as counsel for complainant?

A. Yes, it may be said to be so.

50 X Q. Will you then kindly refresh your recollection from that record which you yourself have offered in another case as a correct copy of the record, and give me an answer to cross-question 36?

A. I have not got the record in my office, as I explained this morning, it is at the printer's, but I suppose I can get it up here in the morning.

51 X Q. Will you kindly do so?

A. I will.

52 X Q. How long after the fore part of October, 1878, did you remain under retainer as solicitor for the Electro Dynamic Light
Co.?
166 A. I was solicitor for the Electro-Dynamic Light Co., if my
memory serves me right, down to the time that the patents of
the Electro-Dynamic Light Co. were transferred to the Eastern Electric Manufacturing Co., and indeed after that, and although I went into the service of the Eastern Electric Manufacturing Co., I still con-

tinued to be counsel for the Electro-Dynamic Light Co., at least in matters appertaining to their patents.

53 X Q. What were the relations — Sawyer and Man with the Electro-Dynamic Light Co., and the Eastern Electric Manufacturing Co., with regard to their joint inventions in electric lighting?

A. Sawyer and Man assigned all their inventions and patents to the Electro-Dynamic Light Co. and they both of them became officers in that company. After the patents were assigned to the Eastern Electric Manufacturing Co. Mr. Sawyer became a stockholder in that company. Whether he was an officer in that company or not, I don't know. Mr. Man also became a stockholder in that company. Whether he became an officer in it, I don't know.

54 X Q. The assignment to the Eastern Electric Manufacturing Co. is dated April 6, 1881, is it not?

A. It so appears by the assignment itself.

55 X Q. And at the date of the application for the patent in suit, viz., January 9, 1880, the Electro-Dynamic Light Co. was the owner of the inventions of Sawyer and Man relating to electric lighting, and you were retained solicitor of that company for the purpose of applying for patents for inventions owned by that company?

A. I was the solicitor of that company to do anything required of me that I might properly do, and I did apply for patents for all the inventions that were brought to me to be patented, or at least I prepared the papers for the applications. In some instances, however, the applications were not perfected and filed by me. I think it is proper for me to say that I did not prepare and file the 167 application for the patent in suit, although the Electro Dynamic Light Co. evidently regarded me as its solicitor at that time, because at the time the application was executed I was called upon by Man, who, I think, was the vice-president and acting president of the company at that time, to go with him to the office of Mr. Cheever and consult with him about the application, and I did go, and was present; but I took no part in the preparation of the application, although Mr. Man consulted me about the specification, or asked me what I thought of it, or something to that effect. I told him I thought the specification was rather crude, to which Mr. Baldwin replied, who was the solicitor for Mr. Cheever, that he had written the specification in great haste, and that it was his intention to immediately file an amended specification. After that I had nothing to do with the case until after the interference was declared.

X Int. 56. What was the first application you prepared for Sawyer & Man as solicitor for the Electro Dynamic Light Co.?

Ans. I really do not recollect. There were a lot of inventions brought to me by Sawyer & Man in the fore part of October, 1878, to be patented, but which application was prepared first I could not tell you.

X Int. 57. As a matter of fact, did you not, after your employment in 1878, prepare and prosecute all the applications made by Sawyer & Man for electric lighting, except the application for the patent in suit?

Ans. As a matter of fact I do not know. Sawyer & Man may have sent some applications to other solicitors about which I have no knowledge, but I did prepare several applications for patents for them right along, from the time I was first employed down to the time that Sawyer & Man, or Sawyer and the Electro Dynamic Light Co. got at loggerheads, and among the rest was a draft of a specification for the patent in suit mentioned by me in my examination-in-chief.

168 58 X Q. Judging from the patents issued to Sawyer and Man, with which I assume you are entirely familiar, do you know of any such application except the application for the patent in suit, which was not prepared and prosecuted by yourself?

A. I cannot say that I do so as to be able to distinguish them, but there were some applications prepared by Sawyer himself, but the numbers of those applications or the inventions described by them I cannot tell at this time, for the reason that I do not remember, but I know there were such applications filed by Sawyer, because after they were filed a power of attorney was given to me to prosecute them, and there were quite a number of them.

59 X Q. So far as you know, were there any applications for patents filed on behalf of Sawyer and Man, relating to electric light between the time of your employment in October, 1878, by the Electro Dynamic Light Co., and April, 1881, when the assignment was made to the Eastern Electric Manufacturing Co., except the application for the patents in suit, in which any other solicitor except yourself was employed, either to prepare or prosecute the applications?

A. I don't know of any application made by Sawyer and Man for joint inventions in which I was not employed as solicitor between the dates mentioned by you, excepting the application for the patent in suit. The application that was filed in that case I did not prepare and was connected with it only as I have stated.

Adjourned till Tuesday the 8th inst. at 11 a. m.

TUESDAY, *January* 8, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX continued as follows:

60 X Q. Have you obtained from the printer the authenti-
169 cated copy of the interference record which you offered in evidence as counsel for complainant in case 3553, in the southern district of New York?

Ans. I have.

X Int. 61. Will you refresh your recollection and tell me whether or not you testified in that case as stated in cross-question 36?

Objected to as incompetent, and as an effort to bring into the case
rbled portion of a record in another case, and as inadmissible in
sence of the production of the entire record in such case.
for defendant is notified that in following this line of ex-
he makes the witness his own, and that a motion will

be made to expunge all such examination from the record at or before the hearing of this cause.

Ans. I have read the deposition as it is printed in the certified copy referred to in the question, but whether that statement is a true statement of what I said in giving my testimony at that time in that case I do not know, as I have already stated, I recollect testifying in that case, and whatever I said was undoubtedly true, but whether that is a correct statement of what I said, I don't remember.

X Int. 62. Have you any doubt as to the correctness of this copy which you yourself offered in evidence in another case as a correct copy?

(Same objection.)

Ans. I put it in evidence in the case referred to, assuming the statement of what I said to be correct, but I can't swear now that it is.

X Int. 63. The matter quoted by me in cross-question 36 is your entire direct examination in the interference case, is it not?

(Same objection.)

Ans. Yes, if the statement quoted is a correct statement of what I said.

X Int. 64. And the direct examination quoted contains the only
statements in the deposition with regard to your knowledge
170 and information as to the making and using of paper carbons by Sawyer and Man?

(Same objection.)

A. What is contained in that statement in my deposition appears in that statement itself. Whether the statement contains all I said or not I don't know. The statement does not contain all the knowledge and information I had at that time about the making and using of paper carbons by Sawyer and Man. The object of the deposition, as I remember it, was to fix the date of their use of paper carbons. I very reluctantly made any deposition in the case at all, but the object was merely to corroborate the other witnesses as to the date, and I purposely omitted saying anything more than was just necessary to fix that date.

65 X Q. If however, you then knew of your own knowledge that the carbon in any lamp of Sawyer and Man you had seen was made from paper, you would have said so in the deposition in the interference case, would you not?

(Same objection.)

A. What I wanted to do, and did do, was to fix a date as nearl
as I possibly could by reference to some circumstance that I v
sure of at which time I had certainly seen their lamp illumi
with a paper-carbon illuminant. If there had been any ear
that I could have fixed with certainty, I think I would
tioned it without doubt.

66 X Q. And if you had known of your own knowledge of lamps made and used by Sawyer and Man, you would have said so instead of resting on the statement as you did, that Sawyer told you that the section of carbon in the lamp was made of paper?

(Same objection.)

A. If I had seen the paper carbon put in the lamp that was then sealed up and illuminated, I would undoubtedly have said so, but I did not see the paper carbon put in that lamp, and could 171 not, of course, swear that the illumi- was made of paper, although I had no doubt but that it was.

X Int. 67. And if at the time of so testifying you recollected having seen any other lamp of Sawyer & Man in which you knew of your own knowledge the carbon to be made of paper you would have said so, would you not?

(Same objection.)

Ans. Well, I don't know whether I would or not. I knew that they were making paper carbons and incandescent electric lamps, but I don't recollect that I ever saw either Sawyer or Man, or either of their workmen, take one of the carbons that I knew to be of paper and put it in the lamp. In that interference I had abundantly proved the fact by other witnesses that they did make paper carbons, and did put them in the lamps, and did illuminate them so that I made my own deposition as brief as possible, intending only to corroborate the other witnesses as to the date. If I had been examined by another counsel the deposition would probably have been very much fuller, but being counsel, I very reluctantly made any deposition at all. In the deposition that I did make, I said as little as possible, and satisfy Mr. Man, who insisted that I should at least swear to the date

X Int. 68. At the time of your visit to Mr. Man's office, as stated in answer 2, how many lamps like "Exhibit Sawyer-Man Lamp No. 1" did he show you?

Ans. Upon my visit to Mr. Man's office on that occasion, I followed him into his private office, and in my presence he opened his safe door, I standing directly in front of the safe, so that I could look right into it, and I saw there a number of lamps, I should say not to exceed three or four. He took one of them out and showed it to me, as I have stated, but he did not take any of the others out.

Adjourned till 1.30 p. m.

Resumed after adjournment.

172 X Int. 69. After being shown this lamp at Mr. Man's office, was the same lamp taken to the shop No. 2 Howard street?

Yes, I think it was.

Q. That lamp had a straight illuminant in it, did it not?

id.

Please explain how it was put in circuit?

A. They had strung alongside of a partition wall circuit wires, leading, as I was told, up to the shop of Arnoux & Hochhausen, and the circuit wires of the lamp were connected on that wire and hung wrong side upwards.

72 X Q. As I understand you, it was supported by the wires on the partition?

A. By the main circuit wires to which the lamp was hung.

73 X Q. How long did you see it remain lighted in that position?

A. Well, I can't tell you; not long. I went there to see it illuminated. Probably it was illuminated there fifteen minutes, perhaps half an hour. It was hung, as I have stated, and we stood there, Sawyer, Man and I, for some little time talking about it, and I expressed a desire to see the dynamo, which was something I had never seen before, as I recollect of. Man took me upstairs to the shop of Arnoux & Hochhausen and showed me a dynamo, and we lingered around there some minutes. Then we came down-stairs; the lamp was still illuminated, and Sawyer took it off the current wires and gave it to Man. I took it in my hands and looked at it again, handed it back to him, and he took it with him. We walked together as far as Broadway through Howard street, where we parted, he going to his office and I to mine. I should say that the lamp was illuminated altogether certainly half an hour.

74 X Q. How much of a shop did they have at that time, and what was in it?

173 A. Well, they had only a small shop, what I would call a laboratory, with one room, which, I should say, was about fifteen feet wide by about thirty to thirty-five feet long. I could tell you what was in it. There was a work-bench, at which Mr. Sawyer was at work fitting together some lamps, several parts of which stood around on the work-bench. I don't recollect that any one else was in the shop but Mr. Sawyer and his father; of the latter, however, I won't be certain.

X Int. 75. What amount of tools and apparatus did they seem to have at that time?

Ans. I cannot tell; at this date I can't recollect what they did have. I felt no interest at that time, of course, in their machinery, so did not take notice, and so really have no recollection of what machinery they had there.

X Int. 76. Is it your impression that the room was one full of machinery and apparatus, presenting the appearance of a busy workshop, or that it was quite bare of machinery and apparatus?

Ans. My recollection about it is—what recollection I have on the subject is—that the laboratory was quite bare of machinery, but was in immediate connection with the machine shop of Arnoux & Hochhausen, which was full of all kinds of machinery, to which they had constant access, as I understood it. There was a door leadin up from their room up a short stairway to the factory of Arnou Hochhausen, into which Mr. Man took me and showed me ar y-

X Int. 77. That is, the shop of Arnoux & Hochhausen w te by floor above? for the

Ans. That I don't recollect. I only recollect that short stairway leading from the laboratory of Sawyer and Man into the shop of Arnoux & Hochhausen.

X Int. 78. How many lamps did you see in the Howard St. shop at the time of your first visit?

Ans. The lamps that I saw there were lamps that were
174 either in process of construction or had been taken apart to
put new carbon in. I think the only lamp that was there that was in condition to illuminate was the one that Man took there from his office.

79 X Q. You saw no lamp with an arch-shaped conductor at that time?

A. No, I did not see any arch-shaped conductor in any lamps there, but Sawyer had some arch-shaped conductors in a paper box standing on the work-bench, which Man took in his hand and showed me, but what they were made of I don't know.

80 X Q. At the time of the visit to Mr. Man's office, and your visit with him to the shop, did Mr. Man tell you of the commercial character of the enterprise he had on hand?

A. I don't recollect now whether he did or not, we were together probably an hour, and during that time I don't think there was anything talked about except the lamps and incandescent electric lighting. The subject was entirely new to me at that time, and the lamps and general idea that he talked about of illuminating houses and cities, and all sorts of things, excited in me a good deal of interest, but what was said I don't know, except in a general way.

81 X Q. Did you understand that they had a perfected and commercial lamp, and that the one you saw like "Exhibit Sawyer-Man Lamp No. 1" was thats lamp?

A. The understanding with which I left Mr. Man, after talking with him about the lamp and the patent or patents, which they had already obtained for it, was that they had worked out a system of incandescent electric lighting, which they were going to introduce into public use as soon as they could perfect their arrangements to do so, and Man said, I recollect, when I left him, that they had a lot of improvements on the lamp that they were going to patent, immediately after vacation, and that as soon as they got ready they would come down and see me. He said that they would take the
patents out right then, before he went into the country, but
175 that they were about organizing a company, and they wanted
the company to pay the expense of taking out the patents. I don't recollect of seeing Man after that till after the summer vacation.

X Int. 82. Was the lamp which you saw illuminated the commercial form of the lamp that Mr. Man proposed to use, as he told you, or was some other lamp to be used?

Ans. I don't recollect now that he said anything about that.
showed me that lamp, and I don't recollect that he said any-
to me about whether he intended to use that particular lamp
cially or some other form of lamp; that they had a lot of
ents on their lamp which they intended to patent, and
ould come and see me when they got ready. I don't

recollect of seeing the lamp again until they brought it to me in the fore part of October, 1878, at my office.

X Int. 83. How many times did you visit this shop at No. 2 Howard street?

Ans. I cannot say now whether I was there again after this visit, of which I have been testifying, or not. I have a vague recollection, or rather impression, of going there and seeing Mr. Church there with Mr. Sawyer, but I do not feel certain enough about it to swear to it.

X Int. 84. When you next visited the shop of Sawyer and Man, it had been moved, as I understand you, to the corner of Walker and Elm streets?

Ans. Yes, it was then the shop of the Electro Dynamic Light Co. which had been organized in the meantime.

X Int. 85. How long was that shop occupied?

Ans. As I recollect it, the company commenced to work there, with Mr. Sawyer as superintendent, and with Mr. Sawyer and Mr. Man as general head and managers of it, about the first of October, 1878, and the shop was occupied by the company until some time in March or April, 1879.

176 X Int. 86. How much of a force did they have there, and what was the size of the shop and quantity of apparatus?

A. I could not tell you. They occupied the whole second floor of the building. What apparatus they had there I can't tell you. The shop was full of men and machinery. At least, the workshop was two rooms; the back room was used as the principal, and what I might call the secret workshop, the door of which was generally kept shut. The door of the outside workshop was also generally kept shut. I know I always had to ring the bell to get into the shop.

87 X Q. When Sawyer and Man called at your office, as stated in answer 4, did they bring any models or lamps with them?

A. They did.

88 X Q. What were they?

A. I think they brought two lamps and switches; I think they brought two varieties of switches.

89 X Q. In your answer to question 4, you do not say that they brought the lamps with them, but that you saw the lamps a few days after the visit you refer to. Please make it clear just what the circumstances were, as nearly as you can recollect?

A. They certainly brought the lamps with them, differing somewhat in the detail of their construction, and also models of switches. It seems to me that one of these switch models was one the frame of which was made of soapstone, and the other was a switch laid out on a block of wood. This whole business at that time was so entirely novel to me that in a very few days after that I visited Sawyer at the shop, and I talked with him about these inventio
and I explained to him that I was not an electrician, and the w by
subject was so entirely new to me that I thought it would for the
for him to write a detailed description of these lamps and
and so on, to enable me to fully understand what the

really were, and in obedience to my advice, he did write a
177 description of such of the machine as I did not understand,
and at this visit, which I have referred to, I saw these lamps
again at the shop.

X Int. 90. And one of these lamps, as I take it, had an arch-shaped conductor, which you were told was made of carbonized paper?

Ans. Yes, that is as I recollect it.

X Int. 91. Is that the lamp you refer to in your deposition in the interference case which has been quoted in X Int. 36?

Ans. I cannot state now which lamp it was that I referred to then. I saw so many of these lamps, either at my office or at their shop, that it is impossible for me to distinguish now which one I saw or referred to at that time. I was so unfamiliar with the subject at that time that I was continually sending to the shop for a lamp, or going there to see one, or something that appertained to the matters that I had in hand pertaining to this business.

X Int. 92. Did they seem to be making in quantity any particular type of lamp, if so, what?

Ans. They were making these lamps, the whole of which, in so far as their exterior and general appearance was concerned, were pretty much alike, differing somewhat in size. Some of them were quite small, the illuminating chamber being from an inch to an inch and a quarter in diameter, some of them being blown out in the form of a bulb at the upper end. The interior of the lamps differed somewhat in construction, those having the loop or U shaped carbons had nothing above the diaphragm or disc in the lamp I have produced, excepting the loop or bow shaped carbon set in studs or electrodes fixed in the disc and secured by some kind of carbonaceous cement. They made both types of these lamps; of which they made the most, or which they had adopted, or intended to adopt as
the best type, I do not know.

178 X Int. 93. The straight carbons produced by depositing on
a core from a hydrocarbon fluid, and then removing the
core, produced, as I understand you, straight, hollow or trough-shaped carbons made of a carbon deposited from the decomposed hydrocarbon fluid, such carbons were not carbons made of paper or fibrous material?

A. All the carbons referred to in the question were made by first making a carbon of fibrous or textile material, paper or willow wood, for example. That carbon was then put into the treating apparatus, by which it was coated by a deposited carbon obtained by the decomposition of a carbonaceous fluid or gas. The stick of carbon so formed would be quite long. It was then cut up in sections of the required length. A longitudinal section of this pencil of carbon reduced to the required length was cut out of the side of e pencil. The fibrous carbon was then dug out of the centre of pencil, the length of the section cut away, thus forming a trough- illuminant, composed wholly of deposited carbon, leaving ort section of the fibrous carbon in each end of the pencil e trough. In some instances, however, the fibrous carbon was bored out of the centre of the deposited carbon with a needle drill, forming a straight tubular carbon; of course it will be understood that where carbons were made in this way, in the form of a bow or arch, they were ground or filed off longitudinally down to the fibrous carbon, which could then be dug out.

94 X Q. Then, as I understand you, arch or U shaped carbons, as well as straight carbons, were made by depositing carbon from a carbonaceous fluid upon a core made of a fibrous carbon, and then removing the core so as to leave an illuminant of the deposited carbon. Do I understand you correctly?

A. Yes; most of the carbons, as I understand it, that were to be used in lamps of high luminosity, having a comparatively large illuminant, were made in that way.

95 X Q. Please look at the lamp Complainant's "Exhibit
179 Broadnax Sawyer-Man Lamp No. 1," does not the trough
remnant of the carbon which is loose in this lamp indicate to you that the illuminant of this lamp when intact was one of the straight-deposited carbons which you have described?

Ans. Yes.

Adjourned till Wednesday, the 9th inst., at 11 a. m.

WEDNESDAY, *January* 9, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX continued as follows:

X Int. 96. What is the foundation in facts of your own knowledge for the statement contained in answer 6, as follows:

"In some cases the original pencils were made of some fibrous material cut to size, carbonized and then treated as described in the patent to Sawyer and Man, 211,262, the fibrous part of the carbon being afterwards removed, leaving a straight shell either in the form of a tube or in the form of a trough of pure-deposit carbon"?

Ans. I know of my own knowledge that they made fibrous carbons, as stated in the answer referred to; I know that they treated those carbons as stated in the patent referred to. I do not recollect whether or not I saw the fibrous carbons removed after they had been treated, but I saw the carbons after they had been made and a central core of fibrous carbon taken out.

X Int. 97. Please state the facts upon which you base the statement that you know of your own knowledge that they made fibrous carbons as stated.

Ans. I saw the fibrous carbons taken out of the retort in which they were carbonized. I saw lots of blanks made of paper, and I
think some of them were made of willow, but of that I won't
180 be certain. I could very well tell that the carbons that were
taken out of the retort were made of paper, because some of them were only partially carbonized, or not carbonized enough t- destroy the appearance of the fibrous quality of the paper. by

98 X Q. The fibrous carbon cores that you speak of then or the part of the answer 6, you think were carbonized paper?

A. Yes.

99 X Q. How did you get the cylindrical shape of the core which appears from the trough-shaped straight carbons, such as the loose one in "Exhibit 1"?

A. I don't know that they were cylindrical, and I don't know that I noticed particularly whether they were or not.

100 X Q. You don't know, then, that they made these cylindrical cores of paper?

A. I don't recollect of seeing them make, or noticing that the paper filaments were cylindrical. It would have been a very easy matter to make them cylindrical, but whether they did so or not, I don't know.

(The second sentence of the answer objected to as volunteered and irresponsive.)

101 X Q. You don't know, then, as a matter of fact, that they used carbonized paper as the cores for these straight, trough-shaped carbons?

A. I think I have given all the knowledge I have upon the subject by actual observation. I have no further knowledge on the subject, except what I have by hearsay. I frequently saw them treating illuminants, both in the form of straight pencils, and in the form of an arch or loop.

102 X Q. These, you now assume, had been previously cut to shape and size from some fibrous material, and then carbonized by Sawyer and Man, or under their direction, but you do not know this?

A. Well, I have already stated, and I now repeat, that I
181 saw them have and cut filaments of paper. I saw those *those*
filaments, or others just like them, taken out of the retort, which retort had been in the furnace of the boiler, and made hot enough to carbonize the paper filaments to different degrees of perfection. I saw these carbons, or others just like them, treated according to their patent 211,262. Now, whether these same carbons were scarfed off, and the central core dug out, I don't know beyond what I was told, and acting, as I was, in a confidential relation to those gentlemen, I had no doubt that the information they gave me was the truth.

X Int. 103. Are you aware of the fact that Sawyer and Man, in making these trough-shaped carbons, or at least some of them, took artists' crayons, purchased on the market, reduced them to proper size, and then covered them with the deposit from the hydrocarbon fluid, and then removed the core?

Ans. I only know that by statements made to me of the fact by Sawyer and Man. I saw some little crayon pencils there, shown to me by them, but I never saw them make any use of them.

X Int. 104. How did you know of your own knowledge that the
eces of carbon which were receiving the deposit were the artists'
ons, or the fibrous material carbonized by them?

I saw them treat the paper carbons, Sawyer took some paper
hat were not, as he said, sufficiently carbonized. He took
ns for the purpose of showing me the effect of a current

upon them, and put them in the circuit. In his treating apparatus he ran the current through them, and as he expressed it, recarbonized them with the current, and took them out and showed them to me that I might see the effect of the oil and the current on the carbon.

X Int. 105. How do you know that these were paper?

Ans. Well, I know that the carbons he treated, as stated in
182 my last answer, were paper, because they were taken out of the retort in my presence along with a lot of others that had not been sufficiently carbonized to lose the appearance that partially carbonized paper would have.

106 X Q. How many were there of these pieces that Mr. Sawyer treated in your presence, as stated in answer 104?

A. On the occasion to which I refer there was but one, and I don't recollect that I ever saw him treat any carbons that I knew to be of paper from any other source than the statement of Sawyer and Man. I frequently saw them treating carbons which they said were paper, and I frequently saw them treating carbons which they said were French pencils.

107 X Q. This particular occasion, then, as I understand you, was the only time that you saw Sawyer or Man, or anybody acting under their direction, treat a carbon made from paper or other fibrous material, where the facts would warrant you in stating that you believe you knew the carbon to be of paper of your own knowledge?

A. I think I have given you all the information I have excepting this, that the paper carbons that I saw made and treated were really made for my benefit. I was called upon by them to get a patent for this paper, or fibrous carbon illuminant, and I wanted to see, as their solicitor, how these carbons were made and treated, and I went there accordingly, and was shown how the thing was done, as I have stated. After that I frequently saw them treating the carbons and cutting out blanks, as I have already stated.

108 X Q. Cannot you give an affirmative answer to cross-question 107?

A. My answer to the question referred to would be yes, but that should be taken in connection with the explanation I have made so as to convey a fair idea of the facts and circumstances exactly as they were.

109 X Q. What was the shape and size of this carbon before it was treated?

183 Ans. Well, I did not measure it, and any estimate that I may make of its size and length must be taken in connection with the fact that it is now some ten years ago since I saw it. The form was a straight pencil, I should say somewhere about two inches long. It may have been a little more. It may have been a littl less. Its cross-section, I should say, would be that of a good-siz knitting-needle.

X Int. 110. This was its appearance as it was taken from tort, as I understand you?

Ans. No, that was its appearance as it appeared in my hand after it had been treated.

X Int. 111. What was its appearance in size and shape as it came from the retort?

Ans. Well, its appearance was intensely black, but it did not appear to be so hard and stiff as after it had been treated, and its size I should think was practically the same—that is, its cross-section.

X Int. 112. Was it round like a knitting-needle, as you say it was, after it was treated?

Ans. I don't recollect that I observed it particularly in that particular, and I don't know whether I observed that it was absolutely cylindrical after it came out of the treating apparatus. What I observed more specially was the difference in the appearance of the carbon after it had been treated, I mean in its color especially. It then had a silvery appearance, such as characterizes silver after it has been worked or polished.

X Int. 113. Why did you not observe its shape in cross-section when taken from the retort?

Ans. Well, I probably had no motive in doing so, and I don't know but that I did, but I don't recollect now.

X Int. 114. Did you examine it very critically when it came from the retort?

Ans. As I recollect, only to this extent. I was comparing
184 the different pieces of carbon that came out of the retort, and
calling Sawyer's attention to the difference which Mr. Sawyer explained as being due to the different degrees of carbonization, and then he showed me that, as I have explained, that particular piece of carbon would be further carbonized by the current, and showed me that it could be, and how it would be changed, and it was done in the twinkling of an eye.

115 X Q. Did you examine the carbon with a microscope?

A. No, I only looked at it through my glasses.

116 X Q. This particular piece of carbon, I take it, was one of the well-carbonized pieces?

A. No, I did not so understand it. It was well carbonized after it had been in the treating apparatus; but Sawyer said that he could take any of those pieces that he took out of the box that had been sufficiently carbonized for him to get a current through, and carbonize them to any degree he chose to with a current.

117 X Q. The carbon, you have said, when taken from the retort, was inte-sely black. I assume, from what you have said, that some other pieces in the retort did not present the same intensely black appearance. Please state what the difference was.

A. That was not the idea I intended to convey. I meant merely to make a comparison between the appearance of the carbon before it went into the treating apparatus and its appearance after it had en treated, but as a matter of fact, some of the paper blanks were partially carbonized, leaving them a very dark-brown color, h any one could plainly see that the blanks were made of

Some of the pieces then were intensely black, and some were dark brown as you saw them in the retort, the particular piece that Sawyer afterwards treated for you was of the former color?

A. Some of them, as I have stated, a few of them, were of
185 very dark-brown color, a few of them seemed to be thor*thor*oughly carbonized so that they could be used as Sawyer said without treatment. Others again, while they were carbonized and thoroughly black, were not sufficiently carbonized, and it was these last that Sawyer said and showed me could be made thoroughly carbonized by running the current through them, and one of which he did run the current through and more thoroughly carbonize it.

X Int. 119. You, however, base your judgment that all the pieces were carbonized paper on the appearance of the brown pieces?

Ans. Yes.

X Int. 120. What experience had you had which would enable you to reach this judgment simply from the appearance of the pieces?

Adjourned till 2 p. m.

Resumed after adjournment.

Ans. At the time referred to I had no experience whatever in the carbonization of paper for any industrial purpose that I recollect of. Of course I knew what the appearance of partially carbonized paper was, but in so far as any experience in the carbonization of paper for use as illuminants for incandescent electric lamps is concerned, I had none whatever.

X Int. 121. How did you know that some of the carbons in the retort "seemed to be thoroughly carbonized."

Ans. Well, I only knew by the fact that some of the carbons were hard, and dense, and stiff, and others were less hard, less dense, and I judged that the hard, dense or stiff carbons were those that were most thoroughly carbonized. I recollect expressing my surprise to Mr. Sawyer that carbon could be made of paper, so hard and dense as some of them were.

X Int. 122. Then, as between those that you thought were thoroughly carbonized, and those that while thoroughly black,
were not sufficiently carbonized, you distinguished the de-
186 gree of carbonization by what seemed to be the difference in hardness, density and stiffness?

A. That is the way I understood it.

123 X Q. What experience had you had to enable you at that time to make such subtle distinctions of your own knowledge?

A. I have already stated to you what experience I had in the carbonization of paper for any industrial use. In drawing the distinctions I have mentioned, I merely exercised such judgment as any educated and intelligent man would be likely to exercise [illegible] such case. Of course I took it for granted that the paper-car[illegible] illuminant must be hard and dense to be fit for use in a lam[illegible] by that such density would be due to a proper carbonizati[illegible] for the paper.

124 X Q. What had been your experience in the carbonization of paper?

A. I don't recollect of ever carbonizing paper for any purpose, unless it was to make what long years ago we used to call tinder boxes, where there was a carbonization of paper for the purpose of lighting a fire with a flint and steel.

125 X Q. The tinder-box suggestion is a mere guess on your part as to possibilities?

A. No, I recollect when I was a boy, we always had a tinder box in the house, and I recollect of filling it very often with burnt paper, and of using it for lighting a fire, but the paper, of course, carbonized in that way was very soft and light.

126 X Q. With regard to this piece of carbon that Mr. Sawyer treated for you by passing a current through it while immersed in a hydrocarbon fluid, what was done with it after the treatment?

A. I don't know what they did with that particular carbon. I did not remain to see. When they got through with the experiment or operation that I came to see, I came away.

187 X Int. 127. This occurred at the shop on the corner of Walker and Elm streets, I take it?

Ans. Yes; and I think it was during the dinner hour, in the middle of the day, that it was done.

X Int. 128. Who else was present?

Ans. Old Mr. Sawyer was there; whether he remained during the whole operation of treating, I don't recollect.

X Int. 129. Your recollection is, though, that it was the dinner hour, when the men had left the shop, and the machinery had stooped?

Ans. I think so.

X Int. 130. How did they get the current to treat the carbon?

Ans. I don't know, probably the engine was kept going, or they may have started up after the dinner hour was over before the treatment took place. They had a little engine and boiler of their own, which they could start or stop whenever they chose, but whether they did so or not, I don't recollect. That was a thing that I did not particularly notice. I was there for a specific purpose, and when that purpose was satisfied, I did not take notice of anything else.

X Int. 131. Can you fix the day when this occurred by any papers, or patents, or applications for patents?

Ans. No, I cannot. It was certainly somewhere between the middle of October and middle of November, 1878. After the visit I testified about to see the carbons made and treated, I went up there again to see the carbons illuminated in the lamp, and to have a further talk with Sawyer about the switch patents, or mp patents, on the application for which I was then engaged, er for the European patent or the American patent, I don't t which, and probably a further discussion of the manner in ich, or of the best method of filing an application for a t for these paper carbons, about which there was a good f discussion between Sawyer and Man and myself.

132 X Q Now, please state precisely what took place on the occasion of your visit to the shop before the carbon was heated?

A. I have already stated, upon my examination-in-chief, and repeated, I think, in different language, on my cross-examination, substantially all that took place. I went up there to the shop as the solicitor of the Electro Dynamic Light Co., to see these carbons made and treated by preconcerted arrangement, either with Mr. Man or Mr. Sawyer. When I got there to the shop first, Sawyer and I got into a desultory conversation about all sorts of things appertaining to patents and electric light. After I had been there a few minutes, I don't know how long, old Mr. Sawyer, I mean Mr. Wm. E. Sawyer's father, called to me and said: "Mr. Broadnax, if you want to see these carbons (or something to that effect) come in here." He was in the workshop, Mr. Wm. E. Sawyer and I both went in there. Mr. Sawyer had the retort opened and took a piece of wire and took the carbons out of the retort, and showed them to me, as I have already stated. We looked at them, and talked about them, and the carbon was treated as I have stated, and when he got through with the treatment of the carbon I went back to my office. It does not seem to me now that I was there more than an hour, although I may have been. I was there long enough, however, to satisfy myself that the making of an incandescent conductor of carbonized paper was an accomplished fact.

133 X Q. You did not see the materials before they were put into the retort?

A. No.

134 X Q. You did not see the retort subjected to heat?

A. No; I don't think I saw the retort in the fire.

135 X Q. Had the retort been opened when Mr. Sawyer,
189 the father, called to you and Wm. E. Sawyer, the son, to come
in and look at the carbon?

Ans. Yes.

X Int. 136. Then when you first saw the retort on this occasion, it was open?

Ans. Yes; and it was hot.

X Int. 137. Is this the same occasion as testified to by you in direct answer 13?

Ans. It is.

X Int. 138. Then you do not want it understood that the statement is made of your own knowledge, in answer 13, "This retort was taken out of the furnace of the steam boiler used to drive the machinery in the Walker and Elm streets shop"?

Ans. No, I did not see the retort put in the furnace, nor did I see it taken out of the furnace. In fact, I did not see it — all, until old Mr. Sawyer called me to see the carbons, as I have stated.

X Int. 139. As I understand from your answer 132, you called the shop and entered into a desultory conversation with Mr. W. E. Sawyer in the outer room of the shop, and that you went by there into the inner room, or workshop, to see the carb or the Mr. Wm. Sawyer called you?

Ans. Yes; that is as I recollect it.

X Int. 140. Would you call the inner room, or the outer room, the exhibition-room?

Ans. The outer room is the room that I would call the exhibition-room, although, it was probably as much of a workshop as the other one was. In the outer room every one was admitted who went to see Mr. Sawyer, and whom Mr. Sawyer wanted to see. The door to the inner room was generally closed.

X Int. 141. I take it that at the time you gave your direct testimony in this case, your recollection was, that the retort, un-
190 opened and in a heated condition, was brought into the outer
or exhibition room, and there opened in your presence; while I understand from your cross-examination that the retort was in the inner room and had been opened before you saw it. Is your recollection as to the matter of what took place at this visit, entirely clear?

A. Perhaps upon my examination-in-chief I did not appreciate the importance of fixing exactly the place where the box was opened, but as I think of what took place in following the details of the matter I feel quite certain that Mr. Wm. E. Sawyer and I went into the inner room in answer to the call of the old man. I think I stated upon my examination-in-chief that the box was opened when the old man called to me. I think the only discrepancy between what I said on my examination-in-chief, and what I have said on my cross-examination is, as to the room in which the box was opened, or in which we went to see the box. The old man may have opened the box in the outer room, but I don't see how it is material whether it was opened in the inner or outer room, and I am perfectly clear now in reflecting upon the arrangement of the shop, that it was in the inner room that I saw the box after it was opened, because the box lay on the work-bench, near the corner of the room, and there was no work-bench in the outer room on that side of the shop.

Adjourned till Friday, the 11th inst., at 11 a. m.

FRIDAY, *January 11th*, 1889.

Met. Present, counsel as before, and the cross-examination of Mr. BROADNAX was continued as follows:

142 X Q. With reference to the carbons shown you on the occasion of your visit to the shop in Walker and Elm streets, and one of
which was treated for you by Mr. Sawyer, was an electrical
191 test made of these carbons to ascertain whether they differed
in resistance to the extent that has been indicated by you?

Ans. I do not remember of my saying anything about the resistance of that or any carbon, nor do I remember of any test having een made to show the resistance of any of the carbons shown to me that occasion.

nt. 143. Was any electrical test made of these carbons, or any tever, except mere handling and inspection, to show that ed in the degree of carbonization?

Ans. Nothing was done to the carbons beyond what I have stated that I remember of. No electrical measurement was made of any of them on that occasion to show the resistance or degrees of carbonization of any of them. It was some little time after that before I saw any of the carbons of Sawyer and Man subject to any tests of that kind.

X Int. 144. Was any electrical or other test made of the particular piece of carbon after it was treated?

Ans. None that I have any knowledge of.

X Int. 145. In comparing the pieces of carbon that were in the retort, as you recollect it, you judged that the stiffer and less elastic pieces were better carbonized?

Ans. No, that is not a fair way to put it. My judgment upon the degree of carbonization of the several pieces that I examined was based upon the comparative density, smoothness and hardness of the several pieces. I took the carbons that were most dense and smooth to be those that were best carbonized.

X Int. 146. You judged wholly from the appearance to the eye?

Ans. Yes.

X Int. 147. What makes you think that the treatment in the hydrocarbon fluid resulted in improving the carbonization of the particular piece subjected to treatment.

Ans. Well, the mere fact that the current was passed through
the carbon until is was raised to high incandescence, was
192 sufficient to satisfy my mind that the conductor subjected to
that degree of heat must be pretty th-roughly carbonized, and
my conclusion that it was more thoroughly carbonized was based upon the fact that the carbon was raised to high incandescence by a current.

148 X Q. However, no test was made to determine whether there had been any change in the degree of carbonization, and it was a mere matter of judgment on your part, from the fact that the carbon was raised to incandescence by the current while immersed in the hydrocarbon fluid?

A. Yes, it was a mere matter of judgment, based on the fact I have named.

149 X Q. You had no experience in determin-g the effect of the heat of an electric current upon a piece of carbon, had you?

A. I don't recollect that I had ever before seen a piece of carbon raised to incandescence by an electric current.

150 X Q. There is no foundation, except in your judgment, formed without experience, for the statement contained in answer 116, that "It was well carbonized after it had been in the treating apparatus"?

A. The foundation for that statement is, as I have already said, based upon the fact that the carbon was raised to high incandescence.

151 X Q. What was the treating apparatus employed by Sawyer on this occasion when he treated the carbon for you

A. I don't know that I am able to describe it in detail. glass receiver connected to a gas pipe and to the elect

The carbon was held between the ends of the conductors leading into the receiver.

152 X Q. Please describe the shape and size of the retort and its
cover and what the appearance of its contents was when
193 you first saw it? I refer to the retort that you saw after it
was opened, and from which a piece of carbon was taken
and treated by Mr. Sawyer.

Ans. As I recollect the retort, it was what I think is called a small-sized sand retort, such as are used for melting metal in by jewelers and others. I did not measure it, and I can only guess at the size. I should think it would be somewhere about two or three inches in diameter, and I should say it would be four or five inches deep. There was a flange about its upper end. How the lid or cover was fastened on I did not notice. The retort was in the shape of a shallow frustum of a cone. It lay on its side on the bench, and the contents were raked out on the bench with a wire. The contents were composed of what appeared to be powdered carbon and the carbonized pieces of paper.

X Int. 153. The statement contained in your answer 6, that you "saw blank illuminants taken out of the box in which they had been carbonized," is based, I take it, upon the circumstances of the occasion that you have been testifying about when Mr. Sawyer took the piece of carbon out of the retort and treated it for you?

Ans. Yes.

X Int. 154. What is the basis in fact for the statement contained in answer 6, that you "frequently saw the carbons treated," which, I take it, you intended to refer to paper carbons?

Ans. The basis of that statement is my experience in seeing the carbons treated.

X Int. 155. I take it the occasion that you have been testifying about when Mr. Sawyer treated the carbon for you is one basis for the statement quoted in my last question.

Ans. Yes, that was the first time I saw the carbons treated. Afterwards I very often saw them treat carbons.

X Int. 156. But that was the occasion when you followed the matter most closely?

Ans. That was the first and most interesting, because
194 it was then entirely novel to me. After that I saw Sawyer
treat carbons very often, but I had no special interest after
that in taking particular notice of the carbons, and the apparatus
in which they were treated.

X Int. 157. That was the occasion on which you had the best opportunity for determining of your own knowledge the character of the carbon treated, was it not?

Ans. No, I can't say that, because I had lots of opportunities, if I had chosen to avail myself of them, to go very fully into an inves-
gation.

X Int. 158. But this was the occasion on which you took advan-
f your opportunities, and on which you were best informed,
wn knowledge, of the character of the carbon treated?

at is the occasion upon which I went to see a thing done about which I have been talked to a good deal, and I took, therefore, personal cognizance, as I have already stated, of the carbons, the carbonization and treatment. I went to see what an incandescing conductor for an electric lamp made of carbonized paper was like, both before and after it was treated. That being done, my mind was satisfied, and I made no further special examination of the matter. I frequently saw the treating afterwards, and carbons that had not been treated and those that had been treated, and had them in my hand, and talked about them a good deal to Sawyer and Man.

X Int. 159. But you think you have reason to believe that you knew of your own knowledge what the character of the carbon treated was better on this occasion than on subsequent occasions?

Ans. I knew of my own knowledge on that occasion what the carbons were made of. I knew that they were made of paper, and I saw them treated, and I frequently after saw carbons treated that were made of paper, or at least I have no doubt but that they were paper, although I did not see them put in the carbonizing
195 box, nor did I see them taken out, but I am as well satisfied that they were paper as if I had seen the blank cut out of paper, carbonized and treated; as if I had stood by and witnessed the whole operation, because all the information I got upon the subject was from those in whose employ I was, in whose interest I was acting, and whose interest it was to tell me the truth, to the end that I might act intelligently in patenting their invention.

160 X Q. My last question was based upon matters of your own knowledge. Cannot you give me a simple affirmative answer to it?

A. I know what my own knowledge was, without believing or reasoning upon the subject at all, and I have repeatedly stated what I know of my own knowledge. I know of my own knowledge what was done on the first occasion, but I do not know of my own knowledge how the paper was carbonized on any other occasion, or to what degree it was carbonized, nor how many of them were treated. A simple affirmative or negative answer to your question would infer that all I knew of my own knowledge about this matter was based upon what I saw on that first occasion, which would not be the whole truth, because, in addition to what I saw on that first occasion, I frequently saw paper blanks that had not been carbonized. I saw the same blanks repeatedly afterwards or blanks that looked just like them, that had been carbonized and afterwards treated, but on no other occasion did I stand by and see the carbons taken out of the retort, examine the lot of them before they were treated, and see them afterwards treated, all at one time. With this explanation, I answer your question directly in the affirmative.

Adjourned till 2 p. m.

Resumed after adjournment.

161 X Q. Have you any distinct recollection of the circum
of any later or subsequent occasions on which you sa
treated?

196 A. None that I can distinguish especially. I frequently saw them treated as an incident of my visit to the works on some matter of business, but I cannot distinguish any particular time.

162 X Q. Can you recollect the circumstances?

A. I don't know that I can. I recollect being there once. I think some time in December, 1878, to see Mr. Sawyer, to get from him the operation of a dynamo-electric machine that I was going to patent for him, and at that time seeing them treat carbons, but I did not go there especially to see the carbons treated or worked with in any way. I had a special object in going there, and that object was to see Mr. Sawyer and get him to explain his dynamo, and I don't recollect that I noted anything about the carbons or lamps that they were then making.

163 X Q. Do you refer to the dynamo machine described in Sawyer's patent No. 237,632, dated February 8, 1881, application filed December 20, 1878?

A. Yes, that is the one.

164 — Q. You were preparing, or about to prepare, the application for the patent, I presume?

A. Yes, I think so, I did prepare that application.

165 X Q. You don't recollect investigating the matter of the treatment that was going on at the time of that visit in December?

A. Not by personal observation.

166 X Q. Did you not see the flask or vessel in which the treatment was being made?

A. I probably did, but I did not specially observe it. I knew they were treating carbons, but I don't know that I ever went over and looked at the apparatus. It was a thing I felt no interest in just then, and did not give it any attention.

167 X Q Do you recollect any other occasion, except the first one, on which your observations were closer and more critical than on the occasion you have referred to in December, 1878?

197 Ans. No, I don't recollect of any.

X Int. 168. You understand the fact to be, do you not, that Sawyer and Man treated by their hydrocarbon treatment other kinds of carbons than carbons from paper or fibrous material?

Ans. I understand that to be so, yes.

X Int. 169. What do you recollect, of your own knowledge, as to the actual putting of carbons into lamps by Sawyer and Man?

Ans. About the only knowledge I have of that consists of seeing old Mr. Sawyer put carbons in the lamps in assembling the several parts of the lamp. I saw him put carbons in the lamps, I think, on two or three occasions, but when these occasions were I cannot tell the dates, or what took me to the shop at the time it was done.

X Int. 170. What kind of carbons were they?

Ans. They were straight pencils at one time, and U-shaped, or -shaped carbons, at another. What the carbons were made of t know, of my own knowledge. I merely inferred that the d carbons were all fibrous carbons. That inference is due that, as I understand it, they did not make any bow-shaped carbons of anything excepting fibrous material at that time, I mean the fall of 1878.

X Int. 171. What were the straight carbons made of?

Ans. I don't know; I don't recollect of ever asking the question. I mean, of course, subsequent to the first time I saw them made and treated, as I have stated. I mean, of course, the first time I visited the works to see the paper carbons, and did see them taken out of the retort carbonized, and one of them treated.

X Int. 172. The bow-shaped carbons, I take it, were of the dug-out character that you have described as being made by depositing carbon upon a core of fibrous carbon and then digging out the fibrous carbon?

198 A. Your question infers that all of the bow-shaped carbons were made in that way, an inference that has no foundation in fact. A few of them, or some of them, were made in that way, undoubtedly, but there were a great many of them made that were not dug out at all, and some of them, as I understand, were not even treated. I saw bow-shaped carbons that had not been treated at all, but whether they were treated before they were put in the lamps or not, I do not know, nor do I know whether those I saw put in the lamps were of the dug-out variety. I do not recollect of observing whether they were dug out or not.

173 X Q. Are you quite certain that you saw any bow-shaped carbons put in lamps?

A. Yes, quite. I recollect distinctly of rallying old man Sawyer about the big clumsy clamps he had to hold the carbons.

174 X Q. What was the character of the clamps?

A. These particular clamps were made of two pieces of carbon set vertically on the top of a leading conductor, and held together by a screw passing transversely through the two parts that composed the clamp and drawing them together on the ends of the illuminating conductor substantially as described in the patent in suit.

175 X Q. Do I understand that you now desire to change the position taken on your direct, and as stated in answers 6 and 7, that you did not see the paper or fibrous carbons "put in the lamp," and, as you expressed it in other words, "did not see them (the different parts of the lamp) assembled"?

A. No; the thought that I intended to convey in my examination-in-chief, and that I intend to convey now, is that I never saw any paper carbons or fibrous carbons put in the lamps, that I knew to be fibrous carbons, excepting as I was informed by Sawyer and Man, or old Mr. Sawyer, William E. Sawyer's father, and when I said that I did not see the lamps assembled, I meant to say
199 that I did not see them assembled as a whole, that is, put together and sealed up. The lamp was made in two principal parts, the leading-in conductors, and, indeed, all the machinery inside the lamp was fixed on a glass disc that closed t
lower end of the globe. The carbons were put in the leading
ductors so as to complete the circuit before the lamp as a wh
assembled, so that putting the carbons in the illuminati
was only a part, or the assembling of a part, of the lar

in my examination-in-chief. I said I did not see the lamp assembled, I meant all the parts of the lamp ready to put on the circuit.

X Int. 176. Then you mean by the expression, putting the carbon in the illuminating or lighting circuit, only the mounting of the carbon upon the leading-in conductors, and not the placing of the leading-in conductors within the lamp globe?

Ans. Yes, that is about what I meant. I suppose if I had remained I would have seen old Mr. Sawyer put all the parts together, that is, complete the assembling of the lamp.

X Int. 177. Am I right then in assuming that you did see Mr. Sawyer's father attach carbons to the leading-in wires, or place them in the lighting circuit, as you have expressed it, but did not see him complete the assembling of the lamps by placing the leading-in conductors and carbons within the lamp globes and sealing such globes?

Ans. Yes, that is substantially correct. The lamp could not be considered as assembled until all its parts necessary to make the lamp were brought together in their right relation. All that I saw the old man do was to put the U-shaped carbons on the electrode leading into the lamp. Before these electrodes were put in the chamber or globe of the lamp they may have been altered, but whether they were or not, I don't know, I assume that they were not, but I don't know.

X Int. 178. Do you wish to be understood that any of the
200 carbons which you saw old Mr. Sawyer or anybody else *selves*,
attach to the leading conductors, or in other words, put in the lighting circuit, were paper or fibrous carbons?

A. Yes, the old man told me that they were fibrous carbons. I don't know whether he said they were willow carbons or paper carbons.

179 X Q. Your position on that matter then is, that you did not see paper or fibrous carbons put into the lamps by Sawyer and Man or anybody for them, but that you did see such carbons attached to the leading conductors or put into the lighting circuit by old man Sawyer, who was working for Sawyer and Man?

A. That is substantially correct.

180 X Q. Has your recollection of this matter changed since you gave your direct examination? You say at the beginning of answer 7 that "I did not see the illuminant put in the lighting circuit."

A. No, my recollection has not changed. What I said in the beginning of my answer to question 7 is exactly as it was in what I say now. I said then, "I mean that I did not see the illuminant put in the lighting circuit, and the lighting circuit put in the lamp. In short, I did not see the lamp made, but I did see the different parts of the lamp before they were assembled, and did see them ter they were assembled, but did not see them being assembled," that is exactly as it was.

X Q. You mean to say now that you did see the illuminant lighting circuit, but that you did not see the lighting in the lamp, and that you think is the meaning of answer 7, when all the matter quoted in your last answer is taken together?

A. Yes, I think so.

182 X Q. Speaking of the bow-shaped carbons which you saw old man Sawyer attach to the wires, you say in answer 172 that you do not recollect observing whether they were dug out or not. Was your observation any closer with respect to the straight carbons which you saw put into the lighting circuit? 201

Ans. No; I don't think it was.

X Int. 183. In answer 7 you make the following statement:

"I desire to add also, that in the case of the straight pencil, it was a common practice for them to make the illuminants, by simply treating it slightly preparatory to using it in the lamp, leaving the fibrous carbon intact as a part of the illuminant."

I take it from what you have said on cross-examination, as to your actual knowledge of the treating of carbons that was done by Sawyer and Man, and also, from what you have said on cross-examination as to your actual knowledge of the putting of carbons into lamps, that this statement is not made of your own knowledge; am I right?

Ans. The exact fact about that is this: Upon one of my visits at the shop some time during the period heretofore referred to by me; I mean between the middle of October and middle of November, or thereabouts; I saw some of these carbons that had the dug-out appearance, and I asked what it was, and how it was done, and it was explained to me, I think by Sawyer himself, how those carbons were made as I have already stated. I did not see any of them dug out, and there were only a few of them that were "dug out." The rest of them were intact, most of them had been treated, some very little, some a good deal. Those that had been treated only a little were not dug out. I will add that I did not see these carbons made, and I did not see the operation of digging out the core.

X Int. 184. This then is the basis for the statement quoted in my last question?

Ans. Yes.

X Int. 185. Did you examine these carbons very carefully?

202 A. I looked at them with a great deal of curiosity.

186 X Q. Did you see any use made of them?

A. I don't remember that I did. I saw straight pencils of carbon that had evidently been made in that way in some of the lamps that had been used. But I don't recollect of seeing that particular kind of carbon illuminated in one of the lamps.

187 X Q. Did you see these carbons before they were treated?

A. These particular carbons I never saw until I saw them in the condition I mentioned, but I saw a good many carbons that had not been treated.

188 X Q. And you did not see these particular carbons treated

A. I have just said so.

189 X Q. And you had no means of telling of your ow edge what the cores of these intact carbon pencils were

A. No; only as I have stated.

190 X Q. That is from what Mr. Sawyer told you?

A. Yes.

Adjourned till Saturday, the 12th inst., at 11 a. m.

NEW YORK, *January* 12, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX was continued, as follows:

191 X Q. What was the explanation made to you by Mr. Sawyer which is referred to in your answer 183?

A. He explained to me how they were made.

192 X Q. Was the entire explanation relating to these carbons of this character—*i. e.*, an explanation of how they were made?

A. The explanation that he made, as I recollect it now, 203 was merely that the carbons in question were made by first carbonizing a piece of paper, or other fibrous material, so as to make an illuminant complete in itself of fibrous material, to take that illuminant and treat it according to the Sawyer-Man patent 211,262, until they had upon it as thick a deposit of carbon made by that process as they wanted; that a longitudinal section of the deposit carbon was then cut away from the illuminant, sufficient to expose the fibrous carbon core, which was then dug out, by which there was left an illuminant of deposit carbon in the form of a trough. That is the substance of the explanation, without pretending to give the language used by Mr. Sawyer in making the explanation.

X Int. 193. And is that the substance of the entire explanation, or substantially all of it?

Ans. That is the substance of the whole explanation, as I now recollect it, and it was sufficient to convey to my mind how the carbon was made.

X Int. 194. The only occasion on which you saw carbons introduced into the lighting circuit by Sawyer and Man, or attached to the conductors, were the occasions about which you have testified in answer to cross-questions 169 to 182, inclusive?

Ans. I cannot say that those were the only occasions. I recollect of seeing old Mr. Sawyer put the bow-shaped carbons in lamps having carbon clamps on the upper ends of the leading-in conductors, like the patent in suit, and I recollect, also, seeing the same kind of carbons set in the upper ends of the leading-in conductors, the holders being made like those in "Exhibit Lamp No. 2." I was at the shop quite often, and saw them working on different parts of the lamp. How often I cannot say, nor can I say just how often I saw them putting carbons in the lighting circuit.

X Int. 195. Referring now to "Exhibit No. 2," introduced in your direct answer 18, this structure has the brass cup not fitted pon the bottom of the lamp, and not filled with any sealing material. Am I right?

A. The brass cup, or cap, which is intended as the final ling of the lamp, has been fitted to the base, but it is not to its proper place. The cup is not filled, nor does it

286

contain any sealing material, but is simply stuck on the base of the lamp.

196 X Q. This, then, is not a completed lamp in its present condition?

A. No.

197 X Q. There is no carbon illuminant within the lamp?

A. No; there is none.

198 X Q. And no loose pieces of carbon within the lamp to show that it was even provided with an illuminant?

A. There are no loose pieces of carbon in the lamp that I am able to discover.

199 X Q. And the blocks of carbon above the soapstone disc are not burnt or discolored in such a way as they would be if an illuminant had been burnt out between them?

A. The carbon-holders in this lamp do not seem to be discolored but very little around the edges of the creases cut to receive the carbon illuminants.

200 X Q. There are no evidences of a carbonaceous or other cement having been used to attach an illuminant to the blocks of carbon in this lamp?

A. I don't see any carbon cement upon the carbon-holder.

201 X Q. What are the holes in the periphery of the soapstone disc intended for?

A. They are intended, and the lamp was so made as a rule, to receive spiral springs to keep the soapstone disc from knocking against the globe of the lamp.

202 X Q. Has this "Exhibit No. 2" any such springs?

A. I don't see any.

203 X Q. You did not intend by your answer to question
205 18 to state that this lamp No. 2 has an illuminant in it of
bow shape or any other shape?

Ans. No, I did not, I merely produced that lamp as one of a kind in which I saw the U-shaped carbons put. I did not intend to say, and don't think I did say that I had seen the U-shaped fibrous carbon in this particular lamp. I produced this lamp because it was the only one I had of the kind of lamps or type of lamps in which the bow-shaped carbon was used; whether there was ever a carbon illuminant in this particular lamp I don't know.

X Int. 204. And there is nothing in the appearance of this "Exhibit No. 2," to indicate that a carbon illuminant of any character has been secured to the carbon blocks by means of a carbonaceous cement or any other kind of a cement, is there?

Ans. Well, I am not willing to swear that there has never been any carbon illuminant in this lamp secured by a carbonaceous cement, because I don't know what the appearance of the lamp would be if there had been. I am not sufficiently familiar with the appearance of the illuminant-holders and the glass globe of the lamp in which illuminants have been placed to make my judgm of any value in that respect.

Adjourned till Tuesday, the 15th inst., at 11 a. m.

NEW YORK, *January 15th*, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX continued as follows:

X Int. 205. As I recollect, your testimony in cross-examination as to the particular occasion when Mr. Sawyer treated a straight piece of carbon for you, you do not recollect the construction of the apparatus used by him in the treating operation?

206 A. Only in a general way, as I have stated; I could not
give a detailed description of it.

206 X Q. And, as I understand from your answers to cross-questions 161, 162, 166 and 167, you did not afterwards observe the treating process and apparatus as critically as on this first occasion, and have no better recollection about the treating apparatus subsequently employed?

A. No, I don't know that I could describe it. In fact I know I could not give any better description of it than I have already done.

207 X Q. Your recollection, I take it, as to the treating apparatus used on the first occasion, when you examined it especially, is only general, that it was a glass vessel with a gas connection and some arrangement for holding the piece of carbon within the vessel filled with the gas?

A. I think I described it in my examination-in-chief as consisting of a glass receiving chamber having a glass bottom or enclosing cover in which there was fitted a receiving nozzle or pipe through which the gas entered into the chamber, and a exit pipe through which the gas escaped from the chamber, and also conducting wires leading to and from the chamber, having on their upper ends a device for holding the carbons to be treated. That, I think, is the whole apparatus substantially. Just what the detail of the fitting was I can't describe, because I don't remember.

208 X Q. The apparatus of that first occasion was not the same as Complainant's Exhibit Sawyer-Man Treating Apparatus, which you described in direct answer 12, and which is introduced in evidence after direct answer 19, was it?

A. It was similar to this, but not exactly like it, I think the lower
part of it was the same. The upper part of it for holding
207 the carbon to be treated was different. Some arrangement
was made, that I don't now recollect, for holding the straight
carbon vertically, one of the metallic electrodes being longer than the
other. I recollect the carbon standing vertically in the receiver,
but I cannot remember how it was fixed.

X Int. 209. That exhibit then is not the apparatus, in all respects at least, which you saw used for treating?

Ans. Substantially it is, all except the little mechanical detail for holding the straight carbon. This is the apparatus, or one like it, which was used for treating the bow or U-shaped carbons.

X Int. 210. The holders or clamps of that exhibit are not so located relatively as to be suitable for holding a straight pencil two inches long or thereabouts, such as you have testified you saw treated?

Ans. No, I think not.

X Int. 211. Do you wish by your answer to cross-question 209, to recede from the position taken in answers to cross-question- 161, 162, 166 and 167, that you did not observe the character of the treating apparatus on occasions subsequent to this first occasion?

Ans. No, I don't mean to recede from any position I have taken. I have not specified the particular occasion upon which I saw this apparatus, Exhibit Sawyer-Man Treating Apparatus, used for treating U-shaped carbons. I recollect seeing them treat with an apparatus like this, or something like this, the U-shaped carbons.

X Int. 212. In answer to cross-question 166, you state, referring to a definite visit to the shop in December, 1878, "I knew they were treating carbons, but I don't know that I even went over and looked at the apparatus," and in answer to cross 167, you state that you do
not recollect any occasion, except the first one, when Sawyer
208 treated the straight carbon for you, on which your observa-
tions were closer and more critical than at the time of the
December visit. Do I understand that you now mean to say that there were after occasions, besides the first one, when the straight carbon was treated, on which other occasions you did not go over and look at the apparatus?

A. I don't recollect just now of any occasion subsequent to December when I paid any attention to any particular treating apparatus, although I may have done so. I have a very distinct recollection of seeing Sawyer treat the straight carbon pencil, as I have stated, and I recollect, also, of seeing the U-shaped carbons treated in apparatus something like this exhibit. Whether it was exactly like that I could not tell, but it was substantially that. When I said in the previous answer that I did not recollect of observing particularly on any other occasion the treating apparatus, I meant subsequently to that visit in December. In fact, it is impossible for me now to distinguish the times when I saw these things done at the shop of Sawyer and Man.

213 X Q. Did you recollect at the time of answering cross-questions 161 to 167 inclusive any time, whether before or after December, 1878, on which you did see the carbons treated and did look at the apparatus?

A. No, I don't know as I had the element of time just then in my mind at all, not thinking it was of any importance whether I saw it before or after my December visit. I know that I saw these things take place, but the order of them I don't recollect at all.

214 X Q. If, as you now state, you did not at the time of answering questions 161 to 167, think it was of any importance whether you saw the treating before or after your December visit (as you were justified in thinking since those questions call for all occasions, and not for occasions after or before any particular time), why did you by your answer to cross-question 212 attempt to avoid the
effect of your answers to cross-questions 161 to 167 inclusive,
209 by — in answering cross-question 167 you were referring to oc-
casions subsequent to your visit in December?

Ans. I don't know that I quite understand the question, it is so very involved, but I had no idea in answering the question I understand you to refer to, of seeking to evade the effect of anything I have said. I merely meant to explain, or rather to state, what occurred to me in connection with the question at that time. It occurred to me then that I did not recollect, at least, I could not call to mind, any special occasion that I saw him treating them, or observed any treating apparatus subsequent to my visit in December, because, as I now recollect it, my visits to the works were quite infrequent towards the latter part of December and January.

X Int. 215. Do you now wish to recede from the position taken in answer to cross 213, that in answering cross-question- 161 to 167 inclusive, you did not have the element of time in mind, and did not think it of importance whether you saw the treating before or after your December visit?

Ans. No, I don't mean to recede from anything.

X Int. 216. Your answer to cross-question 213, then is correct?

Ans. Generally speaking, I think my answers are all correct. I recollect, as I have already stated, and now repeat, of observing, in a general way, the treatment of the carbon that I first saw treated by Mr. Sawyer, the straight pencils, and I recollect, also, of seeing treated (whether Sawyer did it or not, I don't now recollect, but I don't think Sawyer did it, I think it was somebody else) the U-shaped carbons, and I recollect of being there in December when they were treating carbons, but I don't recollect that I went to look particularly at the apparatus or method of treating. The fact of these things being done, I recollect, but the order in which they were done, I don't recollect, nor do I recollect the minute detail of any of the apparatus. When I said that I did not recollect
210 of any other occasion when I had examined more minutely the apparatus, I did not have in my mind at all the apparatus that I described in my examination-in-chief.

217 X Q. Then, it is true, as stated in your answer to cross-question 213, that when you answered cross-questions 161 to 167 inclusive, you did not have the element of time in mind, and did not think it important for the purposes of those questions, whether the occasions were after or before your December visit?

A. No; I don't see how it could be important in any *re*spect of the matter whether it was before or after my December visit. I certainly don't recollect so as to be able to distinguish them of seeing any treating done that I specially noticed subsequent to December, nor do I recollect. If I said that I did not have the element of time in my mind when I answered any question, it is true.

Adjourned till 2 o'clock.

Resumed after adjournment.

218 X Q. I still take it that your answers to cross-questions 161 to 167 are substantially correct, and your examination of the apparatus when Sawyer treated the straight carbon for you, was more thorough and critical than any subsequent observations of the treating apparatus?

A. Whatever I have said is intended to be exactly right, and to avoid the possibility of appearing to mislead, I will state that there are only t-o occasions that I recollect of upon which I observed at all the treating apparatus, and on neither of those occasions did I make a critical examination of them. I saw, in a general way, what they were. One of those occasions I described on my examination-in-chief, where I described the treatment of the U-shaped carbon and the apparatus in a general way, used in treating them, and the other was the treatment of the straight carbon by Sawyer, that I described on my cross-examination, that did not occur to me when I was testifying in chief, and when I was asked by you
211 whether there was any other occasion on *casion on* which
I had more carefully observed the treating apparatus, I took it for granted that you intended to ask me whether there was any other occasion than those which I had referred to, on which I had more carefully examined the treating apparatus, to which I answered in the negative, but I did not then intend to exclude the occasion referred to on my examination-in-chief.

X Int. 219. What is there in cross-question 167 which led you to believe that I excluded any occasion referred to in your direct?

Ans. I don't know that there is anything in terms in the question, but it seems fair to assume that after I had testified about the occasion mentioned in my examination-in-chief, you did not intend to exclude that occasion from your question, and I answered the question rather to meet the substance, perhaps, of the question than its terms.

X Int. 220. Please point out where, in your direct examination, you have testified to any particular occasion on which you saw carbons treated?

Ans. In answer to question 12, in my examination-in-chief, I described an occasion on which I saw an apparatus used in treating U-shaped carbons, substantially like that which I have produced. I did not state any particular time when I saw that, because I could not recollect exactly the time when it occurred, but it is plain from the examination that it was on a different occasion, or at a different time from that mentioned on the cross-examination, when the straight carbon was treated by Mr. Sawyer.

X Int. 221. Where, in answer 12, is any mention made of the U-shaped carbon?

Ans. I don't know, and do not find in the answer referred to that the word U-shaped carbon is used, but in the apparatus produced only U-shaped carbons could be treated, as I understand it, and I stated in that answer that in "these clamps the two ends of the carbon to be treated were secured so as to complete the circuit in the lamp."

212 222 X Q. Could not a straight piece of carbon be secured by the clamps of this Exhibit Sawyer-Man Treating Apparatus?

A. I don't see how a straight pencil could be treated in that apparatus, although it might be possible.

223 X Q. What would prevent the clamps being opened and a

straight piece of carbon laid right across them, and then being secured by the tightening of the nuts of the clamps?

A. The carbon-holders are very near together, so that no straight pencil could be treated in them, unless it might be a very short one, unless the structure of the apparatus was changed.

224 X Q. That is, a straight piece of carbon could be readily secured by the clamps of the exhibit, but its exposed incandescent body would be in length equal only to the distance between the clamps?

A. Yes, that is among the possibilities, but I have no idea that such a thing was ever done with this apparatus, or that the apparatus was made of anything of that kind, and it certainly was not used by Mr. Sawyer in treating a straight pencil as I have described. He had some sort of a device in which he held the pencils vertical in the lighting circuit.

225 X Q. As I understand, and from your cross-examination, you do not know that this Exhibit Sawyer-Man Treating Apparatus was ever seen by you in use, but that you believe it to be substantially the same in construction as the corresponding part of the treating apparatus that you did see in use?

A. Yes, that is substantially what I mean. I don't know that I saw that particular apparatus in use.

226 X Q. And you do not wish your answer to question 12 to be taken as going any further in that direction than your last answer?

A. What I meant to say was, that I had seen the U-shaped
carbons treated in an apparatus that was substantially like
213 that. Whether that is the identical apparatus in which I
saw them treated or not, I do not know.

X Int. 227. How did the "Exhibit Sawyer-Man Treating Apparatus" come into your possession, and when?

Ans. Mr. Albon Man gave it to me in the early part of last summer, or in the latter part of the spring of 1888, as the apparatus in which he and Sawyer treated their U-shaped carbons. He gave it to me at his house, I was there looking over a lot of apparatus of different kinds that he and Sawyer had used in making their electric lamps.

X Int. 228. You were taking testimony at that time in a suit on the same patent which is involved in this suit, brought by the complainant against the Edison Electric Light Co. in the U. S. circuit court for the southern district of New York No. 3553?

Ans. We either were taking testimony in that suit, or had been. My impression is that I got that exhibit before the complainant in that case closed their affirmative proofs.

X Int. 229. Referring to the Sawyer-Man lamps which you saw in 1878 and 1879, were such lamps ever sold or used commercially?

Ans. I don't know whether they were or not.

X Int. 230. Your association with the officers and directors of the Electric Dynamic Light Co. was an intimate one, was it not?

Ans. With some of them, Mr. Man, Mr. Sawyer and Mr. Jacob Hays, I had a good deal of intercourse, but my intercourse was limited to such matters as appertained to the patents of the company. In short, it was a professional one, and more with Mr. Man than any of the rest, although I was in frequent intercourse with Mr. Sawyer.

X Int. 231. If that company had done a commercial business it would have come to your attention, would it not?

Ans. Well it might, and it might not. They may have
214 made and sold lots of lamps without my knowing anything
about it.

232 X Q. How long did you see any of the lamps lighted at any time?

A. I don't know how long, I saw the lamps lighted, more or less of them on almost every occasion when I went to the works, but I don't remember to have ever been there more than an hour or an hour and a half at any one time when the lamps were illuminated. I was there upon one occasion when there was a number of other gentlemen, when there was a number of lamps illuminated. That probably was the longest time I ever saw the lamps illuminated, and looking at it from this length of time, I don't think it was over an hour.

233 X Q. What was this occasion, when was it, and who were present?

A. I don't know who all were present, Mr. Hays, Mr. Myers, Mr. Man, and I think Mr. Judd and others, whose names I don't know. At least I don't recollect them if I ever did know. There was an exposition of the lamps there, broad shutters were put over the windows of the outside room, and a very brilliant illumination of the lamps was had. It was some time in the fall of 1878. I should think it was some time in November, it might have been in December.

234 X Q. What was the purpose of the exhibition, if you know?

A. I don't know that I ever asked what its purpose was, and I don't know that I was ever told what its purpose was, but I inferred that it was to show the lamps to the gentlemen interested, and to others who were invited to see it. I think it was mentioned in the newspapers of the day.

235 X Q. This exhibition was in the outer room of the shop, I take it?

A. Yes.

236 X Q. Please state how the lamps were arranged and
215 supported and how many of them were lighted at one time.

Ans. There was a chandelier hanging pendent in the center of the room, on which there were three lamps, two standing upright and one hanging pendent, and there were around the walls of the room a number of lamps supported in brackets. I don't know how many there were. I don't recollect now, but I have an impression, but it is only an impression, that there were eight lamps in circuit altogether, and they were all illuminated at one time, that were in circuit, and continued to be so illuminated during my stay there.

X Int. 237. Referring to your answers to direct questions 9 and

10, did you know how long the Sawyer and Man lamps would last without burning out the carbons?

Ans. No.

X Int. 238. Or how long they would last without requiring a recharging of the globes?

Ans. No, all the knowledge I have on that subject is mere hearsay information.

X Int. 239. Or whether such lamps were capable of being economically operated?

Ans. I do not know anything about the economy of their operation.

X Int. 240. Or did you know whether they were capable of being used for practical illumination without requiring conductors of such large size as to make their use commercially prohibitive?

(Objected to as incompetent.)

Ans. Those are things about which I had no knowledge at that time.

Adjourned till Wednesday, 16th inst., at 11 a. m.

216 NEW YORK, *January* 16, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX proceeded as follows:

241 X Q. Referring to the following patents granted to William E. Sawyer and Albon Man:

Number.	Date.	Title.
205,144.	June 18, 1878.	Electric lamp.
205,303.	June 25, 1878.	Electric lighting system.
205,305.	June 25, 1878.	Regulator for electric lights,

the applications for which patents were all filed in May, 1878, did you prepare or prosecute these applications for patents?

A. No, I did not prepare them, nor did I prosecute them, or have anything to do with the prosecution of them. The patents referred to were all issued before I was retained by the Electric Dynamic Light Co., or by Sawyer and Man.

242 X Q. Referring to the following patents granted to Wm. E. Sawyer and Albon Man:

Number.	Date.	Title.
210,152.	Nov. 19, 1878.	Switch for electric light.
210,809.	Dec. 10, 1878.	Electric lamp.
211,262.	Jan. 7, 1879.	Carbons for electric lights.
229,335.	June 29, 1880.	" " " "
229,476.	" " "	Electric switch.

The applications for all of which patents were filed in 1878; did you prepare or prosecute these applications?

A. I prepared and prosecuted the applications for all the patents mentioned in the question.

243 X Q. Did you prepare and prosecute the application for the reissue of said patent 205,303, which reissue application was filed May 14, 1881, and resulted in reissue patent No. 10134, dated June 6, 1882?

A. I did.

217 X Int. 244. Do you know of any other patents granted upon joint inventions of Sawyer and Man, or applications for patents filed upon joint inventions of Sawyer and Man other than those mentioned in my last three questions, and excepting of course, the patent in suit?

Ans. I do not recollect of any just now.

Counsel for defendant offers in evidence the patents of Sawyer and Man, referred to in questions 241, 242 and 243, and the same are marked respectively, "Defendant's Exhibits Sawyer-Man Patent No. 210,152, 210,809, 211,262, 229,335, 229,476, 205,144, 205,303, 205,305 and Reissue No. 10134, all of Jan. 16, 1889."

It is stipulated between counsel that ordinary Patent Office copies of the specifications and drawings of said patents, may be marked in evidence, with the same force and effect as certified copies of such patents, subject to correction if any mistake should be discovered in such copies.

X Int. 245. Then, so far as you now recollect you prepared and prosecuted all applications for patents upon the joint inventions of Sawyer and Man, except the application for the patent in suit, and except the three patents which were applied for and granted before you were retained?

Ans. Yes, that is correct. My connection with the preparation and prosecution of the patent in suit, I have already explained.

X Int. 246. I understand that you drew the assignment of Sawyer and Man, to the Electro Dynamic Light Co., dated October 14, 1878, and marked as an exhibit in this case?

Ans. I did.

X Int. 247. I take it that that assignment was intended to cover the inventions which had been described to you at the interview, you have testified about occurring before the date of this assignment, and upon which you had prepared, or intended to prepare, applications for patents?

218 Ans. Yes, that assignment was intended to convey the inventions of the switch, of the carbons, and of the method of treating the carbons. It was made before the applications for the patents were made, and it was intended to cover all their inventions in carbons, as well as in their methods of treating carbons, as well as in electric lighting apparatus, and circuits. The language of the assignment was made broad and general, being made before the applications were made; the plan being to make additional assignments of the patents as soon as they were issued, or at the time the applications were made for each patent, to authorize the Commissioner of Patents, among other things, to issue the patents to the assignee.

248 X Q. The application for patent No. 211,262 was prepared at least as early as the date of this assignment, was it not?

A. It was somewhere about that time. I don't recollect exactly the date. I think the application was prepared before the assignment was made.

249 X Q. It appears that the title of the first improvement mentioned in the assignment is an exact quotation of the title which you gave the invention in the preamble of the specification of patent No. 210,152. Was not this application prepared, or at least its preparation commenced, to a sufficient extent to determine the title you would give the invention, before the execution of the assignment?

A. Yes, I think so.

250 X Q. And, I take it, that the titles are quoted in the assignment from the titles which you had given the applications?

A. Well, I presume so, although I have no recollection of the fact at this time.

251 X Q. It is a fact, is it not, that the title quoted in the assignment in the paragraph beginning "secondly," at the beginning of the assignment, is the precise title that is found in the preamble of the specification of patent No. 211,262?

219 Ans. Yes, the title of the patent referred to, as it appears in the first paragraph of the specification, is in the following language: "Improvements in carbons for electric lights."

X Int. 252. And it is a fact, is it not, that said patent No. 211,262 describes not only improvements in carbons for electric lights, but also in the treatment thereof?

Ans. Yes, I think it does, but of course the best evidence of what is in the patent will appear by the patent itself.

X Int. 253 It is a fact, is it not, that when the application was filed upon which patent 211,262 was granted, the application claimed not only the invention of treating carbon, but also the invention of the carbons themselves, as a new article of manufacture, and that before the patent issued, the claim or claims upon the latter invention were erased, and were embodied in the application which afterwards became patent No. 229,335?

Ans. It is a fact that at the time that application was prepared the process of treating the carbon was described and claimed, and so also was the product of that process, and there it stopped. The idea of making carbon for electric lights in any other way than that described by the patent is not even referred to. Subsequently to the filing of the application it was divided, and another and separate application was filed for the product of the process, making two separate patents for the subject-matter described in the original specification, filed October 15, 1878.

X Int. 254. And that separate application resulted in patent No. 229,335?

Ans. Yes.

Adjourned till 2 o'clock.

Resumed after adjournment.

X Int. 255. Did you retain any copy of the specification prepared by you on the fibrous carbon in April, 1879, or memorandum of claims you made in that specification?

220 A. No, I did not. That specification was, as I think I have stated, in lead pencil, on buff drafting paper, and was a draft submitted to Sawyer for revision.

256 X Q. How complete was it?

A. It was a complete specification.

257 X Q. I take it that it was simply a pencil draft of the specification and claims, and did not include the petition and oath which are necessary for a complete application?

A. Yes, that is correct. It was not an application submitted for execution, but a specification submitted for examination and revision.

258 X Q. Did you ever prepare complete papers for an application on that invention?

A. No.

259 X Q. You did not know whether that pencil draft was employed to any extent in the preparation of the application for the patent in suit?

A. I do not.

260 X Q. Why did you not prepare this application and have it executed and filed in October, 1878, as you did the applications upon which patents No. 210,152 and 211,262 were issued?

A. The application for that patent was delayed primarily for the reason that I was not able to understand how a carbon made of paper or wood was patentable in itself without reference to any combination that it might be united into. Man was very strenuous in his insistance that the invention, by which I mean the carbon itself, was patentable broadly. I recollect of taking down and reading the decision of the Supreme Court in the case of Hotchkiss *vs.* Greenwood, at the time I was discussing with Sawyer and Man the patentability of this invention. A good deal of discussion grew out of the question then between Man and I as to whether that was a parallel case. I cannot tell now what the arguments were
221 that were advanced *pro* and *con.*, but it resulted — poning the
matter for further reflection, consideration, and investigation on my part, and so the thing, being postponed, ran along from time to time, I visiting their workshop and seeing the carbons made, until finally I made the draft of the specification, which I gave to Sawyer, as I have already stated, not thinking that there was any danger in the short delay that would ensue before I could make up my mind what shape to put the application in, I mean the specification. I was very busy in the meantime on the business of the Electro Dynamic Light Co. and others in applying for patents and prosecuting them, both in this country and in Europe.

X Int. 261. In that draft did you attempt to overcome the obstacles raised in your mind by the decision in Hotchkiss *vs.* Greenwood?

Ans. I do not like to swear to what I put into that specification at this time, because I do not recollect what all was in it. I went over the case pretty freely, putting into it all that I thought might possibly be made available. I made up my mind, as I recollect, in a general way now, that I would claim the invention and its application as broadly as I could, and see what would come of it on examination in the Patent Office, knowing, of course, that I could cut it down or revise it, if that should be necessary.

X Int. 262. You held the opinion at that time, and insisted upon it in your arguments and briefs afterwards in the interference case, that the material, independent of the form, was not patentable, did you not?

Ans. I did, but I did so in my ignorance of the properties possessed by such carbons which made it available as an illuminant above all other carbons, so far as I know. Of course I speak of it now as a carbon illuminant, made from carbonized paper or other fibrous material, and in the light of information subsequently acquired.

222 X Int. 263. But at the time of the disclosure of the invention to you, in the fall of 1878, and continuing through the arguments in the interference case as late as 1884, you held the opinion that the carbon of paper or other fibrous material of itself was not patentable, but that such a carbon in the form of an arc or loop was patentable?

A. From the time this invention was first brought to me to patent, down to the time that I finally argued the issues upon the interference case before the Commissioner of Patents in person, I believed that the U-shaped, or loop-shaped carbon illuminant included in the lighting circuit of the lamp was new, irrespective of the kind of carbon it was made of, and I took the ground, in my ignorance of the properties that this particular material as an illuminant possessed, that it was a substitution of one carbon for another, that is, without taking into account the U-shaped form of the carbon, and considering the matter broadly without reference to its form or combination.

264 X Q. When were your views on this subject changed?

A. After the decision of the Commissioner of Patents of the interference, awarding priority of invention to Sawyer and Man, I resumed the prosecution of the application, insisting upon our right to the claims that had been once rejected by the examiner, among which was one for the U-shaped, or loop carbon illuminant. My attention was then called for the first time by the examiner to the British patent of Konn, in which is shown an arch-shaped carbon illuminant, and which, as I thought, anticipated broadly the claim for the U-shaped, or arch-shaped carbon illuminant, and then, in the discussion of the case with the examiner, my attention was called to the patentability of the fibrous-carbon illuminant as such, on account of the properties such carbon possessed, which made it available for electric lighting above all other carbons.

265 X Q. About when was this?

A. It followed very soon after the decision of the Commissioner

223 of Patents upon the question of priority, or as — as I could in the ordinary course get the case before the primary examiner again, according to the practice in the Patent Office. My best recollection is that it occurred in February, 1885.

X Int. 266. What is the name of the examiner with whom this discussion was had?

Ans. I think the name of one of the assistant examiners was Lyon, with whom I discussed that matter, and I discussed it also with one of the other assistants, as it seems to me, whose name I don't now recollect, and also with the examiner in charge of that class. I think his name was Kintner.

X Int. 267. You have stated that the preparation of the application on the U-shaped fibrous carbon was delayed to give you further time to consider and investigate the matter. Do you recollect the fact that Albon Man, one of the joint inventors named in that application, has testified that you advised them not to apply for the patent in the fall of 1878, when you were consulted, but advised them to make further experiments?

Ans. I have not the deposition of Albon Man before me, and I cannot, therefore, know exactly what he said, but it is a fact that I advised the postponement of the application until I could have time to see the carbons made and tried, and further time for reflection; and I can't conceive of Albon Man's swearing to anything that was not corroborative of that statement, but whatever he did say will appear by the record.

X Int. 268. Do you not recollect of Mr. Man's giving the testimony I have referred to?

Ans. I recollect of Mr. Man's testifying upon the matter, and now that you have put in my hands the deposition of Albon Man, I do not see anything in it that is repugnant to or contradictory of my statement. We had a great many interviews upon the subject, but what was said at these several interviews I cannot remember, 224 and I don't think that Albon Man can; but the broad fact that I wanted the application postponed, as I have stated, until further light could be obtained by me upon the matter, by observation and investigation, seems to be clearly remembered by Mr. Man as well as myself.

269 X Q. In a suit brought by complainant against the Edison Electric Light Co., in the U. S. circuit court for the southern district of New York, on patent No. 211,262, you acted as counsel for complainant, did you not?

(Objected to as incompetent.)

A. In equity suit No. 3406, in this court, I appeared as counsel for complainant. That suit was founded upon the patent referred to in the question, and against the Edison Electric Light Co.

Adjourned till Wednesday, the 17th inst., at 11 a. m.

NEW YORK, *January 17th*, 1889.

Met, pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX continued, as follows:

270 X Q. And in that case you took the testimony of Albon Man for the complainant?

(Objection continued.)

A. I did.

271 X Q. Do you recollect that the witness, Albon Man, in answer to the following questions, on cross-examination, made the following answers:

"353 X Q. Are you able to remember a single instance in which counsel was consulted in regard to obtaining a patent on any invention, and advised you not to apply for it?

(Same objections.)

A. Yes, sir.

225 "X Int. 354. Was that counsel Mr. Broadnax?

(Same objections.)

Ans. Yes, sir.

"X Int. 355. What were his reasons for advising you not to apply for the patent?

(Same objections.)

Ans. One case I have specially in mind had reference to a proposed application for fibrous carbon, particularly fibrous carbon made from paper, in regard to which he was consulted early in the fall of 1878, as to which he advised at the time further experiments; afterwards further postponements of the subject-matter.

X Int. 365. Why did he advise further experiments?

(Same objections, and further, as calling for a confidential communication between counsel and client, and the witness is instructed not to answer. Further objected to as incompetent, immaterial and not cross-examination; that the question is not material, either as cross-examination or examination-in-chief to any of the issues in this case, and the same is true of the whole of the so-called cross-examination; the witness is submitted for cross-examination and will answer fully and fairly any and all questions in cross-examination.)

Ans. I am directed by counsel not to answer."

Ans. I recollect Albon Man's testifying in the case referred to, but what questions were asked him by the cross-examining counsel I do not remember, nor do I remember what answers he gave to any questions propounded to him. The record in the case will, of course, show what questions and answers were made.

X Int. 272. Do you not recollect that Albon Man testified in that case that he consulted you with regard to applying for a patent for the fibrous carbon in the fall of 1878, and that you advised him to delay applying for the patent, and to make further experiments?

226 A. No, I don't recollect it out of my own memory, but I see it here printed as part of Albon Man's deposition in the case referred to, and I have no doubt that the questions were propounded and the answers made, as stated in this printed copy of the record, and as quoted by you therefrom, but I can hardly be expected to remember any particular question or answer in a deposition covering over 300 pages of printed matter.

273 X Q. Do you not recollect giving the instruction to the witness, Albon Man, not to answer, which occurs after X Q. 365 of that record, and which is quoted in answer to my question 271 in this record?

(Objected to as incompetent.)

A. I recollect of instructing Mr. Albon Man not to answer on several occasions during that cross-examination, but I don't recollect any particular occasion. Upon reading this record, I have no doubt I did give this instruction therein recorded.

274 X Q. You have stated that you do not think that after the great lapse of time, either you or Albon Man can recollect "what was said at these several interviews" with regard to the reasons for delaying applying for the patent upon the fibrous carbon. You, yourself, have testified in this case as to some reasons which you recollect. Do you consider the reason given by Albon Man, in his testimony quoted in cross-question 271, as inconsistent with the reasons which you have given as a part of your recollection?

A. No; I do not consider that there is any inconsistency between Mr. Man's testimony and mine on that point?

275 X Q. It would be a fair interpretation of Mr. Man's testimony, and of your own, that you have given some reasons whicl you recollect, while Mr. Man has given additional reasons which h recollects, would it not?

A. No; I don't think it would be. I think that the s
227 stance of Mr. Man's testimony is, that I advised postpo
ments and further experiments for the purpose of obtainin
for me further light and knowledge of the subject under considera
tion. That is the substance of my own testimony, and that is th
fact.

X Int. 276. Please state your entire connection with the prepar tion of the application which was filed on January 9, 1880, and r sulted in the pending suit.

Ans. I had absolutely nothing to do with the preparation of th application, unless my presence in the office of Mr. Cheever, whe the application was executed by Mr. Man might be said to be a participation.

X Int. 277. Were you not consulted by Mr. Man?

Ans. I was not consulted by Mr. Man, nor any one else about that application, and I did not know anything about it more than two hours before it was executed.

Adjourned till 2 o'clock p. m.

Resumed after adjournment.

X Int. 278. Why were you present at Mr. Cheever's office?

Ans. Mr. Man called at my office and requested me to go there with him, and I went with him, and Mr. Man told me what he was about to do on the way from my office to Mr. Cheever's office.

X Int. 279. What did he want of you?

Ans. Well, I don't know, unless it was to read the specification, as that is all I did that I recollect of now.

X Int. 280. Did he not ask your advice as to the arrangements he was entering into with regard to the application?

Ans. I don't recollect that he did; the arrangements were all made.

X Int. 281. Did he not tell you what those arrangements were?

Ans. He did not surely until after the transaction was closed.

228 X Int. 282. You knew that there was something unusual in the matter; that is, that it was not to be simply for the benefit of your client, the Electro Light Dynamic Co., which controlled the inventions of Sawyer and Man?

A. I did not know, nor did I hear a single thing about it until it was all done, or about to be done. The motive for the doing of it was entirely unknown to me, until I went with Mr. Man to Mr. Cheever's office to execute the papers.

283 X Q. What was it that became known to you then?

A. Well, nothing, except that they were about to make an application for a patent, and that Mr. Sawyer had consented to join in the application; subsequently Mr. Man told me what the arrangement was.

284 X Q. What was the arrangement?

A. He said that the Electro Dynamic Light Co. had made an arrangement to sell the invention of the patent in suit to Mr. Che-ver, contingent upon Mr. Cheever's paying to the Electro Dynamic Light Co., I think, a hundred thousand dollars for this invention, within certain time, and failing to pay the money within the time agreed upon, all the rights agreed to be given to Mr. Cheever were to revert to the Electro Dynamic Light Co., I think that is a general statement in substance of what he told me; that in the meantime Mr. Cheever had stipulated that he was to employ his own counsel, nd bear the expenses of obtaining the patent.

285 X Q. Was Mr. Cheever also to bear the expenses of an expected interference?

A. That I do not know anything about.

286 X Q. Do you not know that it was expected that there would be an interference with Mr. Edison in the Patent Office?

A. No, I did not know that.

229 287 X Q. Did you ever see the contract with Mr. Cheever?

Ans. No, I don't recollect that I did.

X Int. 288. Have you any papers in your possession of the Electro Dynamic Light Co., such as contracts, minutes of meetings of directors or officers of the company, &c.?

Ans. No, I have not.

X Int. 289. What is the character of the papers of the Electro Dynamic Light Co., that you have in your possession, if any?

Ans. I have the assignments to the Electro Dynamic Light Co. of Sawyer and Man. I think the whole of them have been put in evidence in one case or another.

X Int. 290. Have you at any time had other papers of that company in your possession. If so, what has become of them?

Ans. Yes, I have had papers of the company in my possession, a good many papers. Some of which belonged to the company, and some of which belonged to Mr. Jacob Hays, for whom I took out the foreign patents, but I returned them all to Jacob Hays, who was an officer of the company, and at that time, as I understood it, had possession of the papers.

X Int. 291. Who is the Mr. Cheever you have spoken of?

Ans. I refer to Mr. Charles A. Cheever, of New York city.

X Int. 292. Who was his attorney on the application?

Ans. As I understand it, Mr. William D. Baldwin, of Washington.

X Int. 293. He prepared and filed the application for the patent in suit, did he not?

Ans. It appears so by the record, of my knowledge I don't know, I did not see him prepare it or file it.

X Int. 294. It appears that an interference was declared with an
application of Edison, September 25, 1880, and that on De-
230 cember 4, 1880, you were appointed attorney in the applica-
tion for the patent in suit, all former powers of attorney
being revoked. Please state the circumstances under which you
were appointed attorney in this case.

Objected to as not cross-examination, also because it does not appear from this record that Edison filed any application, nor do any of the other facts stated in the question appear from the record. If any other record is referred to, such record is the best evidence of the facts stated, and should be offered in evidence, if the counsel desires such facts to appear.

Counsel for defendant states that the record referred to by him in his question, is the file-wrapper and contents in the application for the patent in suit.

A. Albon Man came to my office, and as vice-president of the Electro-Dynamic Light Co., said to me that Mr. Cheever had failed to keep his agreement with the company; that is to say, he had not paid the money agreed upon, and that all the rights of the company to the invention in question had again reverted to it, and that the company desired that I should appear for it and prosecute the application and thereupon a power of attorney was given to me, or sent to me, I don't remember which, to take charge of the case. All the rest appears in the record.

295 X Q. Did you draw the power of attorney itself, and secure its signature by Thomas Wallace, president of the Electro-Dynamic Light Co.?

Same objection.

A. I really don't recollect whether I wrote it and sent it down to the office for execution, or whether it was sent to me. I know I had a power of attorney, and I know I filed it, and that thereafter I appeared in the case to the close thereof.

296 X Q. Who are F. L. Gaylord and W. G. Benham, if you know?

Same objection.

231 (*Same objection.*)

Ans. Now, that you have called my attention to that, my impression is that they were men in the employ of Wallace & Sons, at Ansonia, and that the power was sent up there for Tom Wallace to sign.

X Int. 297. What was said at the interview which you had with Mr. Man at his office, after seeing the Herald article, which has been put in evidence in this case?

Ans. Without undertaking to repeat the words which were used by Man and I in our conversation on that occasion, I asked Man if he had read the article in the Herald referred to, and he replied in the affirmative. I asked him if he could not get Sawyer then to join in an application for the patent, to which he replied that he was engaged in some negotiations by which he hoped to be able to bring it about. I don't recollect that there was anything further said. He was very busy with a lot of men about some real-estate matters for some of the Lorilla*nd*s, and, as he did not seem to have anything further to say to me, I turned and left the office.

X Int. 298. That was the entire conversation, or substantially all of it?

Ans. Certainly; there was nothing more said that I remember of.

X Int. 299. After the interference between Sawyer and Man had been decided, and the application for the patent in suit was returned to the primary examiner for action on the merits of the invention, what then happened in the prosecution of the application?

(Objected to as not cross-examination and incompetent, the record of the proceedings in the application in the Patent Office being the best evidence.)

Ans. Well, I went on and prosecuted the application until I got the patent. The several steps taken by me in that prosecution I do not now remember, but they are all matters of record, and can be proved by the record.

232 300 X Q. You recollect very distinctly that an interference was declared with an application for a patent upon the same invention of Walter K. Freeman?

Same objection.

A. There was an interference declared with some man by the name of Freeman. I don't recollect his initials.

301 X Q. Did it come to your notice what electric light interest was represented by the Freeman application?

A. Yes.

302 X Q. What was it?

A. I think that this man Freeman was assignor to the United States Electric Lighting Company, but that is only as I understood it. I don't recollect of ever seeing the assignment.

303 X Q. What made you think it was the U. S. Electric Lighting Company?

A. Because I think Mr. Parker W. Page appeared as solicitor for Freeman, and he was solicitor for the U. S. Electric Lighting Company, and I know that he and Mr. Marcellus Bailey, of Washington, were associated as solicitors for the U. S. Electric Lighting Company.

304 X Q. And both Page and Bailey represented the Freeman application?

Last objection continued.

A. That is the way I understood it.

Adjourned till Friday, the 18th inst., at 10 a. m.

FRIDAY, *January* 18, 1889.

Met pursuant to adjournment. Present, counsel as before, and the cross-examination of Mr. BROADNAX continued as follows:

305 X Q. What became of this interference with Freeman?

233 (Same objections.)

Ans. The interference, as I recollect it now, was allowed to go by default on behalf of Freeman. At all events, it was not prosecuted on his behalf.

X Int. 306. Why was it not prosecuted on his behalf?

(Objected to as not cross-examination, and immaterial and incompetent.)

Ans. As I recollect it now, the U. S. Electric Lighting Company, as I understood it, was the owner of the invention claimed to have been made by Freeman, and that company proposed to submit the question of priority of invention to arbitration, and in the event, that the arbitrators decided that Freeman was the first inventor, that the patent should issue to Freeman, instead of to the assignees of Sawyer and Man for such parts of the invention as Freeman claimed. The question of priority was submitted to arbitration, and priority was awarded to Sawyer and Man, and thereupon the application of Freeman was abandoned, and a patent issued to Sawyer and Man or their assignees.

X Int. 307. What benefit did the U. S. Electric Lighting Company get from the arrangement?

(Same objections.)

Ans. That I do not know.

X Int. 308. How did the proposed arrangement first come to your attention, and who brought it to your attention?

(Same objections.)

Ans. I really do not remember whether the matter was first brought to my attention by Mr. Curtis, one of the attorneys for the U. S. Electric Light Co., or by Mr. Garden, the then vice-president of the Consolidated Electric Light Co., but it was from *of one* them that I first heard of the proposal to arbitrate.

234 309 X Q. What was the proposal in detail that you then heard?

(Same objection, and this objection is continued to all questions that may be asked in regard to the so-called Freeman interference, and any proceedings connected therewith.)

A. As I recollect it, the purpose on the part of the Consolidated Electric Light Co. was to avoid being tied up in the Patent Office in another interference. That was the moving cause, I think, on behalf of the Consolidated Electric Light Co., and the moving cause on behalf of the U. S. Electric Light Co. for getting that application filed and entering upon the arbitration, was to get a license under the patent that had been allowed to us for the invention. So the two companies agreed to submit the matter to arbitration, and that the party in whose favor priority of invention was awarded, should grant the other party a license under the patent on some terms which had been previously agreed upon.

310 X Q. Did you have anything to do with the drawing of the agreement?

A. Yes, I think I did—that is, the agreement for arbitration, I don't recollect whether I drew the license or not.

311 X Q. You drew the agreement to arbitrate then?

A. I don't recollect whether I did or not. I have an impression that Mr. Curtis made the first draft, or somebody in the interest of the U. S. Electric Lighting Co., and that I revised it. And then, I think, it was still further revised by Mr. Garden or Mr. Curtis, or somebody, perhaps Gen. Duncan.

312 X Q. Was it submitted to you before execution?

A. I do not recollect whether it was or not, but I should take it for granted that it was.

235 X Int. 313. Was it submitted to you after execution for approval as to its manner of execution?

Ans. No; I don't remember to have seen it at all after its execution.

X Int. 314. It was, however, an agreement between the complainant herein and the U. S. Electric Lighting Co. owning the invention of Freeman, and relating to the disposition of the interference between the Freeman application and the application for the patent in suit?

Ans. Yes.

X Int. 315. About when was it executed?

Ans. I don't know.

X Int. 316. When did you do your work upon it?

Ans. I don't recollect even that. It was some time, I think, in 1885. It was somewhere between the time of the declaration of the interference of Freeman and the decision of that interference in favor of Sawyer and Man.

X Int. 317. Did you not talk with more than one person about the matter of this agreement?

Ans. I don't recollect of having any talk with any one about it, excepting Mr. Garden and Mr. Curtis.

X Int. 318. As the attorney for Sawyer and Man in the application, you received a notice from the Patent Office that the interference with Freeman had been declared, did you not?

Ans. I did.

X Int. 319. Did you know before that time, or had it been intimated to you, that there would be such an interference?

Ans. No; I never heard of this Freeman till I got notice of the interference from the Patent Office. After I got through with the prosecution of the application of Sawyer and Man, that is, after all the claims had been allowed by the examiner, he told me that he could not issue or send out the formal notice of allowance for the reason that there was an application pending by some one, he
236 didn't say who, that might be put in interference with us, and a short time after that I got the notice of interference, and knew then for the first time who the applicant was and his assignee.

320 X Q. After receiving the notice of interference did you inform your client the complainant?

A. I think I sent the notice to Mr. Garden.

321 X Q. With a letter?

A. Well, I don't know.

322 X Q. Your recollection is, however, that you did not take it to him personally, and discuss it at that time?

A. No; I have no such recollection, because, in fact, I don't recollect whether I sent it to him, or went with it to him. He may have been in my office and I handed it to him there, or I may have taken it to him at his office, or I may have sent it by letter, I don't recollect as to that.

323 X Q. Will you look at your letter book and see if you sent it by letter?

A. Upon an examination of my letter book, covering the whole of March, 1885, I do not find that I sent any letter to Mr. Garden during that period that bears in any way upon this subject-matter, and it is not at all likely that I would have written him a letter upon that subject, as we had personal intercourse almost every day.

324 X Q. Were you in Washington or New York when the interference was declared?

A. I was in New York to the best of my recollection.

325 X Q. But you do not recollect the circumstances or occasion of handing or sending the interference notice to Mr. Garden?

A. I do not.

326 X Q. Do you recollect the first conversation you had with Mr. Garden with regard to this interference with Freeman?

A. No; I do not.

327 X Q. Did you not tell him during some conversa-

237 X Int. 327. Did you not tell him during some conver-ation that the interference with Freeman would delay the issue of the patent to Sawyer and Man?

Ans. I have no recollection of having done so, nor can I see why I should, as he *he* knew that of his own knowledge.

X Int. 328. Do you recollect any conversation that you had with Mr. Garden on the subject of this interference?

Ans. I doubtless talked with him, and he with me on the subject of this interference, but I have no particular interview in my mind that I can distinguish from any of the rest,

X Int. 329. Kindly tell me what you can recollect about these interviews, how many there were, when they took place, and what was said?

Ans. I cannot tell you how many there were, what was said at any of them, nor when they took place. Of course there was a good deal of talk between Garden and I about it, and we agreed pretty generally that it was a put-up job to wring a license out of us, and we discussed on various occasions the question of policy, as to whether it was best for us to submit to the extortion or to spend another year or two in interference in the Patent Office, and finally we reached the conclusion that it was best to submit.

X Int. 330. The result was that you and Mr. Garden concluded it would better for the complainant to purchase the release from the annoyance, risk and delay of another interference by giving the U. S. Electric Lighting Co. a license, which was done?

Ans. I don't think either of us had any doubt after the investigation of the matter, such as we were able to make, about our success in the interference, but the situation of our company at that time made it desirable for us to have the patent issue without further delay, and to avoid the delay which would inevitably occur in fighting the interference, we thought it best to succumb and 238 give the U. S. Electric Lighting Co. a license under the patent, which was done.

331 X Q. Do you recollect the terms of the license agreement?

A. I do not.

332 X Q. Those term-, I suppose, were substantially stated in the agreement which you have called the agreement to arbitrate, and which you helped in the preparation of?

A. I presume that they were.

333 X Q. Did you not also draw the license agreement*ment* or assist in drawing it, or have it submitted to you for approval?

A. I do not recollect whether I drew it or revised it, or whether it was submitted to me merely. The probabilities are that I drew it.

334 X Q. By the agreement was the U. S. Electric Lighting Co. to pay royalty for the use of the invention of Sawyer and Man?

A. Yes.

335 X Q. A substantial or a merely nominal royalty?

A. I don't recollect the amount of the royalty. I think it was so much a lamp, but how much I don't now remember.

336 X Q. Was any distinction made as to the character of the lamps that were to be included or excluded in the payments of royalty?

A. I don't recollect. All I recollect is that there was a license, and that they were to pay royalty; but how much royalty, and what the circumstances or conditions were, I don't recollect. In fact, it is impossible to swear to the contents of the paper, because I don't recollect it.

337 X Q. Do you not recollect that lamps having carbons
239 made from the material known as tamadine were, by *by* the
license agreement, not to be considered subject to the payment of royalty?

Ans. There is some provision in the paper about tamadine, I think, but what it is, I don't know.

X Int. 338. Is it your recollection that the tamadine lamps were made subject to royalty?

Ans. No, I have no recollection about it.

X Int. 339. After the agreement which you have termed the agreement to arbitrate was settled upon, please state what was actually done, and who did it, with regard to the arbitration?

Ans. I think I appeared at the arbitration as counsel for the Consolidated Electric Light Co., and I think Gen. Duncan appeared for the U. S. Electric Light Co., and Mr. Garden was arbitrator for our side, and Mr. Quimby was arbitrator for the U. S. Electric Light Co., and a third arbitrator was to be called in in case they could not agree, and on behalf of the Consolidated Electric Light Co., the records of the interference between Sawyer and Man on the one side, and Thomas A. Edison on the other, about the subject-matter of the patent in suit, was submitted in support of our case, and the *ex parte* affidavits of Mr. Freeman and others taken in support of Mr. Freeman's claim, were submitted in support of Mr. Freeman's case, and thereupon the matter being duly argued by counsel, and considered by the arbitrators, they unanimously decided that Sawyer and Man were the first inventors.

X Int. 340. It did not become necessary then to call in the third arbitrator?

Ans. No.

X Int. 341. When did this take place, where, who were present, and how long did it last?

Ans. The arbitrators met in the office of Mr. Curtis, Mr. Leonard E. Curtis, one of the attorneys for the U. S. Electric Lighting Co.
He was present, Mr. Duncan was present, Mr. Garden was
240 present, Mr. Edward E. Quimby, the gentleman who appears
as expert in patent causes, was present. I was present, and that was all there were present. We were together there probably the best part of an hour, in presenting the case, and I don't know, I think it was two or three days before the arbitrators made their report. I think they made their report in writing. This meeting

was before the decision in the interference was made in the Patent Office, I think, but I cannot give the date, because I don't recollect it.

342 X Q. Do you recollect that it was some time after the interference with Freeman was declared, and before the decision of that interference by the Patent Office?

A. Yes; I should think so.

343 X Q. To whom was the report of the arbitrators made?

A. I suppose that it was made to the U. S. Electric Lighting Co., and to the Consolidated Electric Light Co., but I don't remember to have ever seen it.

344 X Q. You were told the conclusion of the report, I suppose, by somebody?

A. Yes, undoubtedly. I think when the hearing was over Mr. Garden said that he was willing to leave the decision to Mr. Quinby, and after Mr. Quinby decided in favor of Sawyer and Man, Mr. Garden merely concurred.

845 X Q. What became of the record and affidavit submitted to the arbitrators?

A. The record submitted upon our part was the same printed copies that were used before the Commissioner of Patents on the final hearing of the interference with Edison, and those were afterwards returned to me. What was done with the affidavits submitted on behalf of the U. S. Electric Lighting Co., I do not know.

356 X Q. After the interference with Freeman was disposed of you continued the prosecution of the application of Sawyer and Man in the Patent Office, did you not?

241 Ans. I don't recollect whether I did anything further or not after that, but I presume I followed it up until I got the patent. The record will, of course, show what I did, but I do not recollect it of my own memory.

X Int. 347. Did you not consult with the attorneys for the U. S. Electric Lighting Co. as to the form which the application should be finally given before the patent should be issued?

A. No, sir; I did not. I recollect going to Mr. Curtis for some information about some patent, but what it was now I do not recollect.

X Int. 348. Who suggested the amendments in the paper filed by you in the application, April 21, 1885?

Ans. I did, and wrote it, and it is now as I wrote it.

Counsel for defendant requests counsel for complainant to produce the two agreements between the complainant and the U. S. Electric Lighting Company, relating to the invention of the patent in suit, and described by the witness as an agreement to arbitrate the interference between Sawyer and Man and Freeman, and the license agreement under the patent in suit, also, the report of the arbitrators based upon the agreement to arbitrate.

AMOS BROADNAX.

Adjourned till Thursday, the 24th inst., at 11 a. m.

THURSDAY, *January* 24, 1889.

Adjourned till Thursday, the 31st inst., at 11 a. m.

242 NEW YORK, *January* 31*st*, 1889.

Met pursuant to adjournment.

Present: Thomas B. Kerr and L. E. Curtis, Esqs., on behalf of complainant, and Richard N. Dyer, Esq., on behalf of defendant.

It is hereby stipulated that Edison Electric Light Co. is a corporation existing under the laws of the State of New York, and is the vendor of the lamp "Complainant's Exhibit Defendant's Lamp." offered in evidence by complainant's counsel at the end of the direct examination of the witness F. L. Pope, and that this suit is being conducted for and on behalf of the defendant by the counsel and at the expense of the said Edison Electric Light Company; and it is also stipulated that the said Edison Electric Light Company is the successor and the assignee of all the inventions and patents and other property owned by the Edison Electric Light Company, and that the said The Edison Electric Light Company was the owner of the application of Thomas A. Edison involved in the interference referred to in the cross-examination of the witness Broadnax between said application and the application for the patent in suit, and conducted said interference by its own counsel and at its own expence.

Defendant's counsel admits that William E. Sawyer, named in the patent in suit, and one of the applicant's therefor, and his father, William Sawyer, died before the commencement of this suit. This admission is based upon the information and belief of defendant's counsel to that effect, and he reserves the right to withdraw this admission and offer proof to the contrary at any time before the hearing of this case in case he finds he is mistaken as to the fact; otherwise, the admission to stand.

243 Complainant's counsel offers in evidence a copy of the proceedings in the Patent Office in the matter of the application for the patent in suit, certified by the Commissioner of Patents under ten certificates, entitled as follows:

(1.) "File-wrapper and contents of the letters patent granted to William Edward Sawyer and Albon Man, assignor to Electro Dynamic Light Co., May 12, 1885, No. 317,676, for improvement in electric light," which is marked "Complainant's Exhibit Patent Office Proceedings No. 1," January 31, 1889.

(2.) "File-wrapper, contents and drawing down to December 15, 1880, in the matter of the application filed by Thomas A. Edison, December 11, 1879, for improvement in electric lamps and method of making the same," which is marked "Complainant's Exhibit Patent Office Proceedings No. 2," January 31, 1889.

(3.) "Petition for permission to amend preliminary statement and accompanying affidavits, filed in behalf of Edison, in the matter of the interference, Sawyer and Man *vs.* Edison, for improvement in carbons for electric lamps," which is marked "Complainant's Exhibit Patent Office Proceedings No. 3," January 31, 1889.

(4.) "File-wrapper and contents in the matter of the interference William E. Sawyer and Albon Man *vs.* Thomas A. Edison, for improvement in electric lamps or lights," which is marked "Complainant's Exhibit Patent Office Proceedings No. 4," January 31, 1889.

(5.) "Certain papers in the matter of the interference, Sawyer and Man *vs.* Thomas A. Edison, for improvement in electric lights," (the said papers being the depositions in said interference) which is marked "Complainant's Exhibit Patent Office Proceedings No. 5," January 31, 1889.

(6.) "Motion papers and affidavits filed in behalf of Edison, on motion to reopen the case in the matter of the interference Sawyer and Man *vs.* Edison, for improvement in carbon for electric
244 lamps," which is marked "Complainant's Exhibit Patent Office Proceedings No. 6," Jan. 31, 1889.

(7.) "Affidavits of W. E. Sawyer, Robert Street, *et al.*, filed April 3, 1882, in the matter of the interference, Sawyer and Man *vs.* Edison," which is marked "Complainant's Exhibit Patent Office Proceedings No. 7," January 31, 1889.

(8.) "Decision of the Commissioner, July 24th, 1882, in the matter of the interference, Edison *vs.* Sawyer and Man, for improvement in electric lamps," which is marked "Complainant's Exhibit Patent Office Proceedings No. 8," January 31, 1889.

(9.) "File-wrappers and contents in the matter of the appeal to the examiners-in-chief, of Thomas A. Edison, filed June 21, 1883, numbered 79851, for improvement in electric lamps," which is marked "Complainant's Exhibit Patent Office Proceedings No. 9," January 31, 1889.

(10.) "File-wrapper and contents in the matter of the appeal to the Commissioner, filed by William Edward Sawyer and Albon Man, August 3, 1883, for improvement in carbon for electric lighting," which is marked "Complainant's Exhibit Patent Office Proceedings No. 10," January 31, 1889.

Said proceedings are offered in evidence for the following purposes:

(1.) To show that the article published in the New York Herald, which has been offered by the defendant as an anticipation of the patent in suit, was brought before the Commissioner of Patents by the real defendant herein, to wit: The Edison Electric Light Company, as a bar to the granting of the patent in suit, and was fully considered by the Commissioner of Patents, and that the patent in suit was granted, notwithstanding said publication, on the
245 ground that the invention was made by Sawyer and Man prior to the date when said article was published.

(2.) To show that the issue raised by the defendant, in offering the said Herald article in evidence, has been adjudicated in favor of the complainant in a litigated proceeding between the same parties in the Patent Office.

(3.) To explain the delay of five years in the granting of the patent in suit, after the application therefor was filed.

Exhibits and statement by counsel for complainant objected to by counsel for defendant as incompetent, immaterial and irrelevant, and in particular as to "Exhibit No. 2;" that it is only a partial copy of the record, and to the statement that the Edison Electric Light Company is the real defendant herein, or that the Herald article was offered by said company as a bar to the granting of the patent in suit, or that the proceedings in the Patent Office were between the same parties, or that the issues involved were the same as involved in this suit, defendant's counsel insisting that such are not the facts.

Complainant's counsel also offers in evidence certified copies of the depositions of William E. Sawyer and William Sawyer, taken in the said interference. Said depositions being contained in the said "Complainant's Exhibit Patent Office Proceeding No. 5," pages 43 to 59 and 65 to 80 both inclusive of the printed record, entitled "Testimony on behalf of Sawyer and Man" forming a part of said exhibit as depositions of deceased witnesses, taken in a prior judicial proceeding between the same parties or their privies, and involving the same issue as in the present suit, and at the same time makes part of this offer, certified copies of the interfering applications, the declaration of interference and the decisions of the Patent Office in said interference, all of which are contained in the said exhibits making part of the said proceedings already offered in evidence, for the purpose of showing the parties and the subject-matter of said proceeding in which said depositions were given. 246

(Exhibits and statement of counsel for complainant objected to by counsel for defendant as incompetent, immaterial and irrelevant, and the depositions further objected to, because it does not appear that they were taken in a prior judicial proceeding, or in a proceeding between the same parties or their privies, or that the issue in said proceeding or involved in said depositions was the same as in this suit.)

Adjourned till Saturday, February 2, 1889, at 11 a. m.

SATURDAY, *February* 2, 1889.

Met pursuant to adjournment. Present, counsel as before, and also Walter K. Griffin, Esq., for defendant.

Testimony of J. Edgar Bull.

J. EDGAR BULL being called on behalf of complainant and duly sworn, testifies as follows:

Questions by Mr. CURTIS:

1 Q. What is your name, age, residence and occupation?

A. J. Edgar Bull, 31 years of age; I reside in the city of New York; I am a counsellor-at-law.

2 Q. Please examine the paper now handed you, "Complainant's Exhibit Patent Office Proceeding No. 5," and state what, if anything, you had to do with the taking and printing of the deposi-

tions of William Sawyer and William E. Sawyer, which appear at pages 43 to 59 and 65 to 80 inclusive, of the printed record forming part of this exhibit, and entitled "Testimony on behalf of Sawyer and Man?"

A. I was present when those depositions were taken and I personally transcribed the depositions at the time they were
247 given. I was also present when the oath was administered to William Sawyer and William E. Sawyer, and I saw them sworn. The questions and answers were read over to the witnesses by me before they signed their depositions. I also saw both of said witnesses sign their depositions. I compared the original depositions with the proofs of the printed matter found between the pages mentioned in the question, and I know of my own knowledge, that those pages contain a correct transcript of the original depositions.

Int. 3. Where are the original depositions now, so far as you know?

Ans. I believe them to be on file in the office of the Commissioner of Patents at Washington.

Int. 4. Where did you last see them, and under what circumstances?

Ans. I saw them on or about the 22d day of June, 1885, on file in the Patent Office. I went to Washington four or five days before the 22d of June, 1885, for the purpose of obtaining certified copies of these depositions, and other papers in the same interference case. I saw them when I was in Washington at that time, and I presume they are there still.

Int. 5. How do you fix the date referred to in your last answer?

Ans. I see by the certificate of the Commissioner of Patents attached to these depositions "Exhibit Patent Office Proceedings No. 5," that they were certified by him on June 22, 1885. My recollection is that these papers were certified by the Commissioner while I was in Washington, and that I brought them to New York with me when I returned.

Int. 6. Were you familiar at the time with the proceedings in the interference of Sawyer and Man *vs.* Thomas A. Edison, in which these depositions, together with the others forming the printed record in which they are contained, are entitled?

248 A. I was.

7 Q. Were the d*is*positions of William Sawyer and William E. Sawyer, to which you have referred, filed in the Patent Office before the first hearing on the merits before the examiner of interference?

A. They were.

8 Q. Were they used as a part of the proofs in the various hearings had in that interference?

A. They were, to the best of my knowledge and belief.

9 Q. When the depositions were taken, did counsel for Edison attend and cross-examine, as stated in the printed copy, forming part of said "Exhibit Patent Office Proceedings No. 5," already referred to?

A. Yes, he did.

The foregoing deposition objected to by counsel for defendant as relating to the offered exhibits already objected to, and as immaterial.

J. EDGER BULL.

Complainant's counsel offers in evidence the pages of the paper already marked Complainant's "Exhibit Patent Office Proceedings No. 5," referred to in the preceding testimony of the witness, Bull, the same being the deposition of Wm. Sawyer, contained on pages 43 to 59 inclusive, and the deposition of William E. Sawyer, contained on pages 65 to 80 inclusive, of the printed record, entitled "Testimony on behalf of Sawyer and Man," and the same are marked, respectively, "Complainant's Exhibit Deposition of William Sawyer," and "Complainant's Exhibit Deposition of William E. Sawyer," Feb. 2d, 1889.

Complainant's counsel also makes a part of this offer the file-wrapper and contents of the application of Sawyer and Man already marked "Complainant's Exhibit Patent Office Proceedings No. 1,"
the file-wrapper and contents of the application of Thomas A.
249 Edison, already marked "Complainant's Exhibit Patent
Office Proceedings No. 2," the file-wrapper and contents of the interference already marked "Complainant's Exhibit Patent Office Proceedings No. 4," and the various decisions contained in the file-wrapper and contents in the matter of the appeal, already marked "Complainant's Exhibit Patent Office Proceedings No. 10."

Complainant's counsel requests the examiner to enter the said depositions of William Sawyer and William E. Sawyer in full on the record at this place.

In the United States Patent Office.

WILLIAM E. SAWYER and ALBON MAN
vs.
THOMAS A. EDISON.
} Interference—Electric Lighting.

NEW YORK, *March* 17, 1881.

Parties met, pursuant to adjournment.

Present: Amos Broadnax, counsel for Sawyer and Man; and Dyer and Wilber for Edison.

Testimony of William Sawyer.

WILLIAM SAWYER, witness produced on behalf of Sawyer and Man, was called and sworn:

Int. 1. State your name, age, residence and occupation.

Ans. My name is William Sawyer, age, 59 years; reside at Earle's hotel, in the city of New York; am a machinist.

Int. 2. State, if you please, where you were employed in the spring of 1878.

Ans. At 43 Centre street, in the city of New York.

Int. 3. By whom were you employed?

Ans. By Mr. A. Man and my son, William E. Sawyer.

Int. 4. About what time in the spring, or latter part of the winter, did you go in their employ?

250 A. In February or March of the same year.

5 Q. Please state what you were employed to do for your son and Mr. Man.

A. Employed in constructing what we call an incandescent electric lamp; about our first was in producing a carbon suitable for our purpose, *i. e.*, to be used in a lamp; amongst others were other materials; we experimented upon different papers in various manners.

6 Q. Please state what you yourself had to do with making carbons for the electric lamps—of carbonized paper.

A. Merely to assist them in their work.

7 Q. Did you, as an assistant to them, cut the paper into the form that you wanted the carbon to be, and then put it in a box and carbonize it?

(Question objected to as being leading.)

A. I assisted in that; yes.

8 Q. Describe how you made carbons—or carbonized paper for electric lamps?

A. Our first attempt was by paper—say blotting paper—by putting graphite or plumbago, and then rubbing and working in this graphite until it is permeated with it. We then applied the two poles of an electric machine to it to see if we could get the current through. It went through imperfectly, but not satisfactorily. We then put that paper into the lamp filled with common illuminating gas. Then we sealed the lamp and applied the electricity. The result was, we got an imperfect current. We took the lamp apart, examined it, and virtually went through the same operation again. That was the first attempt at carbonizing paper.

9 Q. What shape were the pieces of paper which you tried to carbonize in that way? Please to look at Sawyer Exhibit No. 1, and state if you recognize any of the forms shown on that drawing as being the same as those used by Sawyer and Man, to make carbons for their lamp.

A. I recognize from Nos. 1 to 7 inclusive.

251 Int. 10. As I understand you, they used straight strips of paper?

Ans. Our first attempt was with them.

Int. 11. And some arched pieces of different forms?

Ans. Yes, sir.

Int. 12. After they got through with their efforts to carbonize the paper with the current of electricity, what other way did they adopt to carbonize the paper?

Ans. By putting it into powdered carbon and subject it to heat; sometimes saturated paper with a solution of acid, or with solution of powdered carbon and water.

Int. 13. In preparing the paper for carbonization, did they first wet it?

Ans. As a general thing, in a solution of some sort of carbonaceous matter.

Int. 14. What did they put the pulverized carbon in?

Ans. In an iron box.

Int. 15. Always in an iron box?

Ans. Not always. My impression is in a tin box first, but that was melted out. Afterwards in an iron box, which I got out, or made.

Int. 16. How did they arrange the paper to be carbonized in the box with the pulverized carbon?

Ans. With alternate layers of carbon and paper. First carbon, then paper; carbon again, then paper, till — box was filled; and pressed down with a follower in the box, so to get it as compact as possible. Last layer was carbon.

Int. 17. After you got the box filled, did they put a cover on it, and how was it fastened?

Ans. Cover was put on and fastened down with wire.

Int. 18. Did you see the paper and carbon put in the box?

Ans. Yes. My impression is I put them in myself. I know I put some of them in.

252 19 Q. Did you see the box put in the fire and heated?

A. Not the first, but I did afterwards. The first box that was filled Mr. Man took home and brought it back in the morning. He could not open the box on account of the iron having been fused, and I put a pressure on it and opened it.

20 Q. Did you put the lid on the box and wire it down?

A. Yes, we together did, he assisted.

21 Q. Did you open that same box the next morning?

A. I did.

22 Q. Were the wires still on it the same as you had put them on the night previous?

A. Still on; but in different places fused together, so as considerable effort was required to cut them without destroying the material inside.

23 Q. After you got the box open, did you take out the carbonized paper?

A. We took them—I at least saw them taken out.

24 Q. What condition were they in?

A. Various. Some perfect; others broken or destroyed.

25 Q. Did you put any of those carbons that were in that box in a sealed lamp and try them?

A. Yes, sir.

26 Q. How did it do?

A. With varied success.

27 Q. What do you mean?

A. Some would run longer than others. Some would fail. Some would do very well. Some would fail from imperfections of the lamp; from sealing, or, as we judged, from imperfect contacts or mechanism.

253 28 Q. State, as near as you recollect, how long the best of them was used in the lamp in a state of incandescence?

Ans. Should judge anywhere from one, to three or four days, or perhaps a week, at different times. Have no distinct recollections of the exact time any one burned. I can positively state it was more than one day or two.

Int. 29. How long have you seen any one of the best of them burn continuously?

Ans. We would put on the current and run it as long as the machine ran, and then take it off. That would be, say from four to five hours at a time, as nearly as I can recollect, and then when the engine commenced again, we would put it on, the power being furnished by the building in which we rented the room.

Int. 30. After you had run it that way, and took it off, how did they appear?

Ans. Some would seem to be in perfect order and some imperfect—principally owing to the defective mechanism in the lamp.

Int. 31. How often was the iron box charged with carbon and paper, and carbonized as you have described, in Centre street?

Ans. Can't state the number of times, but was used quite a number of times.

Int. 32. Did you see it (the box) put in the fire, and the paper carbonized, after the instance you mentioned of Mr. Man taking the box home?

Ans. Yes; put it in myself and took it out.

Int. 33. Saw the papers put in, and saw the carbons taken out?

Ans. Yes.

Int. 34. Was the result about the same?

Ans. Yes, sir.

Int. 35. All this, I understand, took place in Centre street?

Ans. Yes.

254 36 Q. When was it that you quit work in Centre street?

A. Can't say.

37 Q. Where did you go from Centre street?

A. To Nos. 2 and 4 Howard street.

38 Q. When did you go to Nos. 2 and 4 Howard street?

A. I think in the summer of 1878.

39 Q. Do you recollect what time in the summer?

A. Should judge, as near as I can recollect, in June.

40 Q. Did you use any carbons made of carbonized paper there?

A. We might have done it, but my impression is we did not. I think after we left Centre street we began on a different kind of carbon, but afterwards returned to paper.

41 Q. After you got through at corner of Howard and Centre streets, where did you go?

A. Corner of Walker and Elm.

42 Q. When did you go to the corner of Walker and Elm streets?

A. October, 1878, I think.

43 Q. Can you recollect what time in October?

A. Couldn't state positively; probably some time between the first and the 15th of the month.

44 Q. Do you recollect whether or not you returned to the use of carbonized-paper carbons corner of Elm and Walker streets?

A. I do; yes.

45 Q. Were the carbons of carbonized paper, that you used corner Walker and Elm streets, made in the same way that they were at 43 Centre street?

A. Virtually so, but we added at different times several other treatments; by solidifying the paper; pounding it, and subjecting it to hydraulic pressure.

46 Q. Was the results of the carbonization about the same as in Centre street?

255 Ans. Was better.

Int. 47. Do you recollect of cutting the carbon burner to the desired form out of the carbonized paper, after its carbonization?

Ans. Yes.

Int. 48. How did you do that?

Ans. Done by a knife and file; that is, was worked down to the form we wanted them by these tools; were delicate things to handle; used to stick them to a piece of glass with balsam or cement, and cut them down. By merely warming the glass we could take them off by subjecting the glass to a blaze—heat; we could take all the superfluous or foreign coating from the carbon.

Int. 49. How much of the time did you use carbons made of carbonized paper, while at the corner of Walker and Elm streets?

Ans. I think we were at work upon them several weeks.

Int. 50. Did you see them put in the lamps and illuminated?

Ans. Yes; I put them in.

Int. 51. State how long you saw any one of the carbons made of carbonized paper illuminated continuously at the corner of Walker and Elm streets, as near as you can recollect.

Ans. My answer is about as before. We ran them from day to day.

Int. 52. Did you take occasion to examine them after they had been thus illuminated?

Ans. Yes; some seemed as perfect as when they went in; others were fractured.

Int. 53. How many lamps did you have in circuit in Elm and Walker?

Ans. The highest number, I think, was eight.

256 Int. 54. Was that as many lamps as your electro-dynamo machine would supply with the necessary current to illuminate the lamps?

A. Don't think it was; but the size of our engine limited us. We didn't have power enough to run the dynamo machine up to its capacity.

55 Q. What was the size of the engine?

A. Normally six-horse-power engine, and six-horse-power boiler. I don't think it was a six-horse-power boiler, however.

56 Q. You say you had as many as eight lamps in circuit at one time?

A. Yes, to the best of my recollection.

57 Q. State if you know how many of those lamps were filled with carbonized-paper burners?

A. Can't say positively, but think all were furnished with such burners.

58 Q. Did you put the carbonized-paper burners in the lamps yourself?

A. Yes.

59 Q. In Centre as well as Walker streets?

A. Yes; I made them all.

60 Q. Please to look at the drawing making part of the patent granted to William E. Sawyer and Albon Man, June 19, 1878, No. 205,144, and state, if you please, whether you recognize that as an illustration of either of the lamps to which you have been referring in your examination?

A. I do.

61 Q. In which of the shops to which you have referred in your examination were lamps like that made?

A. I think in Howard street, and I know corner of Elm and Walker streets.

62 Q. Look at drawing making part of the patent granted to William E. Sawyer and Albon Man, December 10, 1878, No. 210,809, and state whether the drawing making part of the patent
257 last mentioned respresents either of — lamps to which you have been referring in your examination?

Ans. Yes, I recognize it.

Int. 63. In which shop was that made?

Ans. I think corner of Walker and Elm streets. I know we made them there.

Int. 64. Please look at drawing which I hand you, making part of the application for the patent involved in this interference, and state whether that drawing represents any one of the lamps to which you have referred in your examination.

Ans. Yes, I recognize it fully.

Int. 65. Can you state where lamps of that style were made?

Ans. Corner Walker and Elm streets.

Int. 66. What kind of a lamp was it in which you used the paper-carbon burners, at No. 43 Centre street?

Ans. Like Fig. 7, Exhibit Sawyer No. 1.

(The drawing marked Sawyer Exhibit No. 4, and referred to by witness in answer to question 64, is admitted by counsel for Edison to be a copy of the drawing, making part of the application of Sawyer and Man, involved in this interference.)

(This drawing is offered in evidence, and marked "Sawyer Exhibit No. 4.")

(Counsel for Sawyer and Man gives notice to counsel for Mr. Edison, that upon the hearing of this interference, he will use in evidence the file-papers, making part of the application for patent on behalf of Sawyer and Man, and also on behalf of Mr. Edison, and also the patents which are of record in the Patent Office, No. 210,809, dated December 10, 1878, and No. 205,144, dated June 18, 1878, both of which were granted to Sawyer and Man, numbered and dated as aforesaid.)

Int. 67. Referring now to the lamp shown in the patent No. 205,144, to which I have referred, state whether you saw any carbons made of paper used in that lamp.

258 Ans. I don't recollect that I did.

Int. 68. State if you recollect of seeing carbons made of paper used in the lamps illustrated in the patent 210,809, to which we have referred.

Ans. Don't recollect that I did.

Int. 69. State, if you recollect, of seeing carbons made of paper used in the lamps shown by the drawing, "Sawyer Exhibit No. 4."

Ans. I do recollect it.

Int. 70. State whether or not that substantially represents the lamps in which you used these paper carbons at the corner of Walker and Elm streets, New York.

Ans. I do.

Int. 71. How soon after you moved to corner Elm and Walker streets, was it that you commenced to use this lamp with the paper-carbon burners?

Ans. Immediately.

Cross-examination by GEORGE W. DYER, Esq., counsel for Mr. Edison:

X Int. 72. About the box which you got up for carbonizing paper at Centre street, when did you get it up, and how was it constructed; answer fully.

Ans. We commenced work on this paper immediately after we went into the shop; a box was constructed out of either American or Russian sheet iron, to the best of my recollection; box was oblong and rectangular; judge it was three or four inches—probably four—long, and about two and a half, or two and three-quarters inches wide, about two inches deep; it was cut out of a single piece of sheet metal, making the bottom and sides and ends—sides and ends being turned up at right angles; it was secured at the corners by lapping over and pounding together, or brought up in close contact; a counterpart of the same, made of sheet metal, but not so deep as the first, slipped over it and constituted the cover.

259 73 X Q. How long was that box used?

A. Don't think more than once; think Mr. Man fused it together the first time it was used.

74 X Q. Describe the next box you got up?

A. Was about the same as this one; indeed, we made several like it; I think I improvised one of these boxes out of a piece of cast iron.

75 X Q. When was the cast-iron box made, and describe it?

A. Couldn't say when it was made, but about that time; its shape was circular—a section of a hollow tube—about 2½ inches in diameter, inside dimensions; was made of cast-iron tubing, such as might be found in any junk shop; the top and bottom were made of flat pieces of cast-iron metal to cover the ends; the ends fitted so tightly that powdered carbon would not sift out; the ends were secured by winding wire lengthwise over the whole.

76 X Q. Is this the box that was principally used after this?

A. No; this one was only used once.

77 X Q. How many did you make after that before you got the one you used principally?

A. Did not use any "principally;" we would generally destroy the boxes in using them once or twice; we made new ones whenever they were needed.

78 X Q. Were those you made subsequently any different from the ones made of pipe?

A. We never made but that one out of pipe; we made no others of cast iron.

79 X Q. You said, in answer to a question in the examination-in chief, that you, yourself, saw one or more of these boxes of carbonization packed and unpacked after they came from the furnace; when you opened such box what did you see in the interior?

A. Powdered carbon and the pieces that we put in.

260 80 X Q. Were the boxes just as full when unpacked as when packed?

A. Don't think they were.

81 X Q. How much waste was there of the powdered carbon in the box?

A. Couldn't say; didn't measure it or weigh it.

82 X Q. Apparently, how much?

A. The best I can say is some waste; part of it looked like ashes.

83 X Q. In what part of the box did you find the ashes?

A. On the top or at the edges.

84 X Q. How large were the papers for carbons you put in such boxes?

A. Generally cut out for our immediate purpose; sometimes we would change the shape, as I described in my examination-in-chief. I should judge the straight ones were from ¼ of an in. to ⅜ in. in length; these were about ⅛ in. in width, I think, and about the thickness of ordinary blotting paper; those of the arch form were about the same in width and length (that is, across the base); the straight one extended about ¼ in. over the loop.

85 X Q. Were these all cut of ordinary blotting paper?

A. No.

85½ X Q. What was the thickness of them?

A. Ordinary blotting paper was used when we used such paper, except that the blotting paper could be compressed, whereas the other could not, with the means we had at hand. I did not measure them, and do not state this as an expert.

86 X Q. How much would these papers shrink in becoming carbonized?

A. Don't know.

87 X Q. You say that some of the paper carbons were
261 *were* used at the Centre-street shop in a lamp like figure 7 of "Exhibit No. 1;" is that so?

Ans. Yes; used them in two ways.

X Int. 88. Was this lamp a bottle, and if so, what kind of a bottle?

Ans. No.

X Int. 89. What was it?

Ans. If I am right about it, they are called Florence flasks in the market.

X Int. 90. How was the mouth of it stopped?

Ans. As a general thing by a glass stopper; then, again by a metallic stopper; tried them both ways; also used cork stoppers.

X Int. 91. How did you fill these flasks with illuminating gas?

Ans. By centre hole in the stopper; then we put our tube in there and put on the force of the gas and drove the air out, this tube not being close fitting in the hole; and also by exhausting the air from the flask and applying a close-fitting tube.

X Int. 92. How did you stop this tube hole after you had finished putting in the illuminating gas?

Ans. By a plug.

X Int. 93. By pulling tube out, then putting a plug in?

Ans. Yes; there was no other way.

X Int. 94. When you exhausted the air from the flask, how did you do that?

Ans. By applying an air pump, in some instances; in others we used quicksilver.

X Int. 95. Explain how you applied the air pump and how you removed it.

Ans. Mr. Man did that; he took the flasks out and exhausted
the air out of them by an air pump; will not state that this
262 was on this one particular form of flask; can't state what particular form of globe it was on; we have more than a dozen or
twenty forms.

96 X Q. Do you know of your own knowledge that the air was ever exhausted from one of those flasks, bottles or lamps used in the Centre shop?

A. I know we attempted it with quicksilver; whether we exhausted it or not is another matter.

97 X Q. How did you attempt it with quicksilver?

A. By filling the tube with quicksilver, and by letting it run out through a plug; also used water in connection with it, I think, how I can't tell; Mr. Man and Ed. (Wm. E. Sawyer) always did this, and I stood by and assisted in various ways; just how it was done I cannot now explain.

98 X Q You mean to be understood that you have forgotten about this part of the experiment?

A. I do not; some of the minor details do not strike me forcibly.

99 X Q. Did Mr. Man and Wm. E. Sawyer, in using quicksilver for exhausting the air, put the quicksilver first into the flask, bottle or lamp, then put in the mouth-piece with a tube in it, and then pour out the quicksilver through the tube?

A. Can't state that positively, but my impression is it was filled through a tube let out through a tube. My impression is the quicksilver as it went in forced out the air.

100 X Q. How long was this tube?

A. I couldn't state.

101 X Q. Can't you tell whether it was an inch, or a foot, or six feet long?

A. Can't answer.

102 X Q. When the quicksilver went into the flask, bottle or lamp, how was the carbon conductor protected from destruction?

263 A. I don't think in this particular flask, Fig. "Exhibit 1," we ever exhausted the air except by introducing gas. I don't think they ever used the quicksilver to exhaust the air, where a paper carbon was employed; in all such instances they filled the lamp with illuminating gas. The lamp they used quicksilver in is, I believe, "Fig. 7, Exhibit 1." We used other carbons besides paper in this lamp, and held them (the other carbons) by the spring of the post——

(The former question, X Int. 102, objected to by counsel of Sawyer and Man, on the ground that it is not cross-examination, and on the ground that the witness has already stated that he did not understand the details of the exhausting of the air out of the lamps, or making vacuum in the lamps.)

Witness, resuming, says he has no further answer to make to the question.

X Int. 103. In these experiments at Centre street, what kind of apparatus produced the electricity employed?

Ans. We had at that time an Arnoux & Hochhausen machine, which was the one used. Afterwards we had other machines at Centre street. I believe we had a Weston. Had no others to my recollection, except a machine to charge up with, which was of the same kind as the other one, *i. e.*, an Arnoux & Hochhausen machine.

X Int. 104. Which machine was used in the experiments where light was produced in electric lamps with paper-carbon conductors?

Ans. Arnoux & Hochhausen.

X Int. 105. Give the dimensions, as near as you can, of some parts of that machine?

(Objected to as not cross-examination, and not bearing on the matter in issue.)

Ans. My impression is that it is one of Arnoux & Hochhausen's No. 2 machine—the armature runs in water.

X Int. 106. Do you know about its resistances?

(Same objections.)

264 Ans. I do not; am not an expert in that matter.

Redirect examination:

Int. 107. In answer to cross-question 100, you say you couldn't state how long the tube was used in putting quicksilver into the lamp chamber, and further on you say, in answer to question 101, you could not tell whether it was a foot or six feet long?

Ans. That was what Mr. Dyer said. Presumably it did not exceed a foot.

Int. 108. Have you any distinct recollection as to how long it was?

Ans. I have not.

Int. 109. X Int. 101 was as follows: "Can't you tell whether it was an inch, or a foot, or six feet long?" and your answer is: "Cannot answer." Do you mean by that answer that you couldn't tell how long the tube was, or you couldn't tell whether it was one inch long, or a foot long, or six feet long?

Ans. Couldn't tell how long it was, but presumably not exceeding a foot in length.

Int. 110. Have you any distinct recollection as to how the air was exhausted from the chamber of the lamp?

Ans. Have not.

Int. 111. Did you have an air pump in the shop for that purpose?

Ans. I have no recollection of one being brought into the shop.

Int. 112. Was the lamp taken away from the shop for the purpose of exhausting the air out of it?

Ans. It was.

Int. 113. Then you don't of your own knowledge know the air was exhausted from the lamp, or whether it was exhausted?

Ans. From my own personal knowledge, no.

265 114 Q. But you saw the lamp after it was sealed and saw it burning?

A. Yes.

115 Q. Did you seal any of them yourself at the shop in Center street?

A. I did.

116 Q. And the air was exhausted after the lamp was sealed?

A. Yes.

117 Q. Referring to the lamps exhibited by figure 7, Exhibit Sawyer No. 1, how many holes were made in the glass stopper?

A. In some cases we had three, and in some four.

118 Q. The conductors went through two of the holes?

A. Yes.

119 Q. And when the lamp was filled with gas it was either put in it through a tube in a central hole, the tube being smaller than the hole to allow the gas or atmosphere to escape through the hole around the outside of the tube, or in cases where there were four holes in the stopper of the lamps the gas was put into one hole and escaped through another?

Objected to as outrageously leading under the circumstances.

A. That was the arrangement as nearly as I can remember.

Cross-examination resumed:

120 Q. What kind of sealing was that referred to in your answer to question 115?

A. We used the glass stopper; sometimes we used nothing but the ground stopper. Then, again, we used Canada balsam on the stopper. Some other kinds of lamps had a flat piece of glass to come right
against the nose or bottle that we used that was brought right
266 up in contact and bolted to a wooden or metal flange on
top of the flange on the muzzle, as shown in the patents
already referred to.

121 X Q. How did you seal the holes in the stoppers?

A. Was done by a plug—some by simple plug; others by a nut and bolt, one inside and the other outside, jammed up.

WILLIAM SAWYER.

NEW YORK, *April* 12, 1881.

Parties met pursuant to adjournment.

Present: Amos Broadnax, counsel for Sawyer and Man, and Dyer and Wilber for Edison.

Testimony of William E. Sawyer.

WILLIAM E. SAWYER, a witness produced on behalf of Sawyer and Man, being duly sworn and interrogated by Mr. BROADNAX, testified as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is William E. Sawyer; my age 31 years; my residence is Hotel Devonshire; my occupation is an electrician.

2 Q. Please state whether you are the Wm. E. Sawyer one of the parties to this interference?

A. I am.

3 Q. The subject-matter of this interference, as given by the Patent Office, is: "The incandescent conductor for an electric lamp formed of carbonized paper;" please state whether or not you, in conjunction with Albon Man, have at any time made and used such a conductor?

A. We have; a great many times.

4 Q. State, as near as you can recollect, when it was that you
and Mr. Man first made such a conductor?
267 A. Almost immediately after we went to 43 Centre street;
should think about the 6th or 7th of March, 1878; might
have been a little earlier or later.

Int. 5. Give the circumstances that gave birth to that invention.

Ans. Before I became associated with Mr. Man I was associated with a Mr. Jas. Flannagan at the coal and iron exchange, where I made a number of experiments in electric lights; I had a theory that the most perfect incandescent lamp would be one having the highest resistance and the least transverse mass, and I filed an application in the Patent Office for a chalk or some similar material held between two conductors, and containing in a little groove, run-

ning across from conductor to conductor, a powdered graphite or carbon to carry out this idea; I don't remember the exact wording of the specification, but the patent was never granted, but is probably on file in the Patent Office now; I spoke to Mr. Man of this idea, and sat down at my desk, 43 Centre street, and drew pencil marks on some ordinary foolscap writing paper, rather heavy, and I took two small copper wires and held them with my fingers on that while the generators were running; when he brought the wires very close together, we could only get a little spark; then Mr. Man and I went around to a place where they deal in pure graphite, and got some samples; I'm not exactly sure what kind of paper we used, but think we laid the same kind of a piece of paper, or a piece of blotting paper, and drew a heavy line with a pencil, so as to make a creasing; then we filled the crease with powdered graphite, and then brushed it off of the top so as to leave only what was in the crease; we had had some trouble getting the current through that, but when we succeeded, we charred or burnt the paper; I recollect that in looking at that, I suggested to Mr. Man the charred parts that were left were so fine that it would probably make a good carbon; Mr. Man then took a piece of blotting paper; at first they were simply straight strips one eighth to three-
268 sixteenths in width, and perhaps one-half inch to one inch in length. Mr. Man worked over them, rubbing and pounding them with graphite, till he got them full of it. But the resistance was higher than what we had laid in the crease of the paper, and it was some time before we succeeded in making the current go through it. Of course, this destroyed the paper. Am not sure at whose suggestion, but to prevent that, we put the strip in a sealed globe filled with ordinary illuminating gas. I should not think it took over a minute to carbonize them. That blackened the globes. We treated those carbons in globes, *i. e.*, we passed the current through the carbons, while a stream of illuminating gas was flowing through the globes, we concluded that that was a rather expensive way of making carbons. Concluded that the best way to do it was to burn it out, the way as we done in carbonizing any material. We had no facilities there, there being neither a stove or a furnace. Mr. Man and father hunted around, found two old pieces of thick cast iron. One looked as if it might have been the foot of some heavy piece of furniture or machinery. Had a hollow in it. The other, if I recollect rightly, was merely a flat piece of iron. We cut out pieces of blotting paper, and, I believe, an old drawing we had. Mr. Man packed them into that with some common powdered gas-retort carbon, which he got from Charles T. Chester in Centre street. Mr. Man took the box home (should say the made-up trap), and brought it over the next morning with the paper carbonized. I would take those, treating them, and puting them in lamps. Most of the experimenting after that was done by Mr. Man himself. My own idea was that a much harder carbon would be better than those thin, fragile paper carbons, but Mr. Man preferred the paper. I think he does till this day.

6 Q. After you had the paper carbons made, state whether you

treated them electrically in the presence of hydrocarbon, for the purpose of consolidating and enlarging them?

269 Ans. Yes. I did.

Int. 7. In making the carbons of the form you wanted them to use in your lamps, did you do that before or after the paper was carbonized?

Ans. Almost entirely before. When we wanted to expose the broad side to the light, we had to cut them out before, but when exposed edgewise, we could bend them after they were carbonized.

Int. 8. Of what form did you make the burners of carbonized paper?

Ans. Generally in the form of a half circle or circle, but experimented with all conceivable shapes. Anything that would suggest itself as capable of allowing for the expansion and contraction of carbon.

Int. 9. Can't you specify some of the different forms besides a circle and a half circle?

Ans. We also used a straight piece; a V-shaped piece. These sketches which I hand you represent some of the forms of carbon which we made of paper. (Witness makes a sketch.)

(Sketches offered in evidence as part of the witness' testimony, and is marked "Sawyer Exhibit No. 6, April 12, 1881," W. H. B., notary public.)

Int. 10. Referring to this sketch you have made, state whether the letter "*a*" represents the enlarged part of the carbon that was used to hold the burner by in the supporting conductors.

Ans. It does in Figs. 1, 2 and 3; in the others it does not.

Int. 11. How were the carbons represented in Figs. 4 and 5 held in the connecting conductors?

Ans. By clamping the ends; frequently we slit the ends of the conductors, which were sometimes of carbon and sometimes of metal.

Int. 12. Do Figs. 1, 2 and 3 represent a side elevation
270 of the carbon held in the lamp, and the others a kind of perspective?

A. Figs. 1 and 2 represent a side elevation; Fig. 3 was made with the flat side up, as shown in Fig. 6, in which "*b*" is an oblong square piece of carbon, screwed to metallic upright, "*c*" by screw "*d*;" "*e*" is a piece of carbon cut in the shape shown, with a square slot through the lower jaw, through which an oblong carbon, "*d*" passes. The connection with the carbonized incandescent part was made by the pressure of the weight of "*e*" on "*b*."

13 Q. Fig. 6, as I understand you, represents but one conductor, and one side of the connection between the conductor and the carbon section?

A. Yes, the other end of the incandescent conductor was held in precisely the same way, object was to get a very light, though sure contact; the carbons shown in Figs. 4 and 5, were held as shown in Fig. 7; in some made in that form. I think, my father made a square cavity, which was packed with powdered carbon after the burner was put in; some of them were held as shown by the drawing "Sawyer Exhibit No. 5;" the wire shown in the bottom of the clamp, Fig. 4, was only used occasionally, when the carbon was thin and the clamp imperfect in shape, to bring the clamp up against the carbon burner.

14 Q. Does this drawing, "Sawyer Exhibit No. 4," represent the lamp substantially in which you used those paper-carbon burners?

A. That represents the lamps as finally used, but it was only one of the many forms of lamps we used; and it particularly represents one of the lamps I took down at 94 Walker street, in the winter of '79–'80, to give to a friend of mine Mr. Arnoux—of Arnoux and Hochhausen—on the Monday morning after the announcement of Mr. Edison's discovery, to show to him that we had previously invented that; this was, I think, on the 20th of December, 1879, that the Herald published that account about Edison;
as soon as I got to my shop on Monday morning, which was
271 *got to my shop on Monday morning, which was* about 9 o'clock,
I took this lamp to Mr. Arnoux, and requested him to hand it to Mr. Shanks, of the Tribune, to keep as an evidence, that Mr. Edison was not the original inventor—to satisfy him; and I did it thus early, that it could not be said that we possibly could have had time to manufacture it after Edison's announcement; this lamp was taken down in January or February, of the same year, eleven months previous, having been broken; it might have been as early as December, 1878; Mr. Lawrence Myers saw this lamp in operation, and I think, saw it broken; it was taken down, I know, during Mr. Myers' stay there.

Int. 15. Referring now to the paper carbons, some of which are represented in the sketch, "Sawyer Exhibit No. 6," state whether or not you put them in a sealed lamp and tested their practicability.

Ans. Yes, sir; we did.

Int. 16. Did you try any of the carbons illustrated by the drawing "Sawyer Exhibit No. 6," and if so, which of them?

Ans. The carbons shown in figures 1, 2 and 3 and the half circle, were positively used; were sealed up and run; the great trouble with them was when we raised the temperature till we could get a bright light they would break; for this reason I preferred the harder carbons; we finally made them hard enough by treating them in hydrocarbon gas by the Sawyer-Man process.

Int. 17. How long did they last in the lamp?

Ans. Untreated by the Sawyer-Man process, would last from one second to ten minutes, if run up to give a good bright light; if run at a low temperature, they would run anywhere from an hour to one hundred hours; it depends entirely upon the temperature.

Int. 18. State, as nearly as you can recollect, how long the best
of the paper carbons you made at 43 Centre street would last
272 in the lamp when raised to a temperature high enough to
give a good bright light, after having been treated by the Sawyer-Man process.

A. Run at a power of about 25 candles they would last from 5 to

100 hours; once in awhile we would get a lamp so perfect in every respect that it would seem to undergo no change after a long use; but generally they would fracture in from 5 to 20 hours, run at that temperature; the difference in the duration of the burners was due to both imperfections in the lamp and in the carbon; where the fracture alone occurs it must be due either to imperfection in the carbon or the effect of unequal expansions; when consumption occurs it is due to the imperfect charging of the lamp.

19 Q. State as near as you can recollect, about how long you and Mr. Man continued your experiments at 43 Centre street.

A. Should think about two months; all the time we were there.

20 Q. After you got through there, did you resume your experiments at any other place?

A. We moved from there to 2 Howard street, where I don't think we made any experiments on lamps, not having facilities for such experiments; we then moved in the fall of the year to 94 Walker street; I have got memoranda to show all these things; we moved to 94 Walker street during the 18th and 19th of October, 1878.

21 Q. State what, if any experiments you made with carbonized-paper carbons at 94 Walker street.

A. We employed an assistant who is dead now (Edwin L. Myers), and Mr. Man and I divided our work. Mr. Man experimenting with carbons, and partly assisted by Mr. Myers; Mr. Myers conducting the charging of the lamps and myself designing the different apparatuses connected with lamps such as switches, dynamo machines and electrical measurements, &c., &c. I knew that Mr. Man continued carbonizing paper and live willow twigs, and a good
deal of such work generally, but I took no active part in it
273 myself. He *but I took no active part in it myself. He* made
the carbons and I used them. I don't think I ever did another thing in the manufacture of those carbons after I came in Walker street. We divided up our work, and I had a general knowledge of what was going on. Almost every day Mr. Man would have some new carbons to offer. Made a good many by taking artist crayon (called the French willow carbon). He carbonized all kinds of woods. Mr. Lawrence Myers brought him in, I think, a willow twig, which he carbonized. Among other forms of carbon Mr. Man made one of willow twig, like figure 8, Sawyer Exhibit No. 6. What Mr. Man did not do in carbonizing different things can't be imagined, for he did nothing else but work on that about all the time.

Int. 22. Please state whether or not you began and perfected the invention of the paper-carbon burners while you and Mr. Man were at 43 Center street?

Ans. Yes, sir.

Int. 23. State, as near as you can recollect, when it was, while you were at 43 Center street, that you got the invention of the carbonized-paper burner perfected?

Ans. It was within two or three weeks after we got in 43 Centre street.

APRIL 13, 1881.

Parties met pursuant to adjournment.
Same counsel present as before.

Cross-examination of WM. E. SAWYER by GEORGE W. DYER, Esq., of counsel for Mr. Edison:

X Int. 24. Can you give the date when you moved to 43 Centre street?

Ans. About the first of March, 1878.

X Int. 25. Who were the premises hired from?

Ans. From the engineer of the building. Am not positive, but think his name was Porter.

274 26 X Q. What power did you use in that building in your experiments?

A. The regular power furnished to the building was shafting motion in the shop when I took it.

27 X Q. What kind of electrical engine did you use at that place?

A. Had several engines there. Arnoux and Hochhausen had put one of their machines for electric lighting down in the engine-room, and they gave us permission to run wire from the shop down in the engine-room. Then, afterwards, I had a Hochhausen electro-plating machine, which I bought, and another Hochhausen machine like the plating machine, but wound with a finer wire, which I borrowed. Then there were two or three machines set in there for us to try. I think all of these were Weston machines, (electro-plating), but we could not do anything with these Weston machines.

28 X Q. What was the electric power or capacity of each of these Arnoux and Hochhausen machines?

A. The light machine in the engine-room had a high electromotive force, comparatively, had, I should judge, two ohms internal resistance. I never measured this, but judge from another machine of the same make which I now have. That was the very first machine of that design which Arnoux and Hochhausen ever made. When put in there it was incomplete. They put it in for trial, to satisfy themselves of its capabilities. I think this machine was about equal to the intermediate size which they were making a year or two ago. I don't think they make just such a machine now. They said that the machines gave a light by the arc of 20,000 candles, but I should judge it only gave about 5,000 candles. The plating machines had a low electro-motive force; I don't think had more than one-half ohms resistance; would give no voltaic at all; was driven at 1,500 revolutions a minute. The third machine was charged up by the plating machine. The armature was wound with fine wire, and was driven at a speed of about *and was*
275 *driven at a speed of about* 4,000 revolutions a minute; only the armature coil being connected with the lamps. Is nothing to be said about the Weston machines; could not do anything with them. I mean they did not have electro-motive force enough to overcome the resistance of the lamps.

X Int. 29. How long did you occupy that shop?

Ans. I went from there to Washington, and gave it up, after being there two months, and not over three; should think about two months—perhaps three months.

X Int 30. What force did you have in that shop?

Ans. Nobody employed in the shop but my father, William Sawyer. We had work done outside. We had some of the mechanical parts of the lamps made outside to save time in the shop; not very much done outside of the shop.

X Int. 31. By whom was this outside mechanical work done?

Ans. Is difficult to answer. My father would have it attended to. One man in the same building did a good deal of it. Pearce & Jones, of William street, did some work. Generally, father would go in some shop, take a man off his work and put him on a little job. I can't tell you the date Pearce & Jones did work. It was while I was with Mr. Man. I get it from an account with Mr. Man, in which the dates do not appear. I think it was about the time we were in this shop—while I was first associated with Mr. Man.

X Int. 32. In your answer to the fifth question, you say: "I had a theory that the most perfect incandescent lamp would be one having the highest resistance and the least transverse mass." What effort did you ever make to develop that theory, and when?

Ans. The first effort was in an application for a patent, the idea
of which was a thin layer of powdered carbon on a refractory
276 base. (Witness here makes a sketch, which is made a part
of his evidence, marked "Sawyer's Exhibit 7, April 13th,
1881, W. H. B.", and proceeds as follows:)

Fig. 1 is a top view. Fig. 2 is a side view. A is a refractory base, and a narrow groove running along the top, opening in an enlarged space at the ends, up into which the two conductors B B come. The carbon (powdered) was laid in the groove and packed in the end space; this may not be exactly in the form of the application, but is substantially the same. This was a frequent subject of conversation—with some other applications I put in with Mr. Man.

33 X Q. Was this application to which you refer, first in your own name, or was Mr. Man associated with you?

A. Was in my own name—made some time before I knew Mr. Man. Think the application was not made earlier than October, 1877, and not later than January, 1878; I was continually filing applications, and as this was rejected it cleared my desk of all record of it.

34 X Q. What became of this application?

A. Was rejected, and don't recollect the grounds.

35 X Q. Have you made any effort to amend it or keep it alive?

A. Undoubtedly it was amended, but I don't recollect what was done about it. Probably I considered the examiners' objection as good.

36 X Q. Did you prepare that application yourself?

A. I did.

(Counsel for Edison gives notice that the production of this application will be required at the hearing of this interference.)

37 X Q. What other effort did you make to develop the theory inquired of in 32 X Q.?

A. The effort to develop that theory and put it in practice was made with Mr. Man at 43 Centre street.

277 38 X Q. Has that theory ever been stated in any of your patents for electric lights, or in those of Sawyer and Man?

Ans. I can't recollect whether it has been stated or not in any of the patents.

X Int. 39. In another portion of your fifth answer you speak of carbonizing paper in what you call a "made-up trap" in which you packed the paper with "powdered gas-retort carbon;" what effect would that carbon have upon the paper?

Ans. No effect whatever. This carbon which was sold by Mr. Chester was purified carbon, which he sold at about $1 per pound. It was used to surround the paper and protect it from the air; more for this than any other purpose.

X Int. 40. What effect did the subsequent treatment of these carbons in the presence of the hydrocarbons, have upon the carbons themselves? I refer to the 6th Int. and answer.

Ans. Two quite different effects. In some cases the whole mass of the original carbon would be hardened, and become homogeneous with the further deposit. In other cases the original would remain unchanged and the deposit carbon could, perhaps, be broken off from it. This was due probably to difference in the manipulation. If the original carbon was heated up so as to drive out included gases, but not sufficient to decompose the hydrocarbon surrounding it, its pores will become permeated by the hydrocarbon which a quick impulse of current will decompose in the mass of the carbon, thus hardening it, and so on. But if the carbon is heated so hot as to decompose the surrounding hydrocarbon in the first place, then the original carbon will remain unchanged. By combining the two processes, the original and deposit carbon, may be made one and substantially the same.

X Int. 41. What effect did this treatment have upon the resistance of the carbon conductors?

278 A. Would reduce the resistance in proportion to the extent of the treatment.

42 X Q. As a matter of fact, about how much was the resistance reduced?

A. Mr. Mann's idea and mine upon that question of resistance began to differ. That is to say, my theory that the most perfect electric lamp would be one in which the incandescent conductor had the highest resistance and the least tra-verse mass was gradually abandoned by myself while largely retained by Mr. Man, my present theory being that the most perfect electric lamp is one in which the incandescent conductor has not only the least transverse mass, but the least resistance. I soon began to reduce the resistance of my carbons to as low as an ohm; at present I make them only $\frac{1}{4}$ ohm, therefore, I would treat the carbons so as to obtain a heavy deposit. Judging from the difficulty in getting the current through some of Mr. Man's carbons, treated according to his ideas, they must have had as high as 100 ohms resistance, but I don't recollect whether we made measurements of any particular ones. Answering the question directly, I should say that Mr. Man reduced the resistance in his carbons from fifty to seventy-five per cent. by the treatment referred to. This is an estimate, and not the result of measurement.

43 X Q. Did this diminution of resistance in the carbon conductors greatly increase the heat within the lamp?

A. Increased the heat, but not in proportion to the diminution of the resistance.

44 X Q. Did this increased heat require the use, in some of your patented lamps, of radiators to convey away the surface heat?

A. In some of them; but don't use them in my present lamps, as they will stand the heat without.

45 X Q. Referring now to your answer to the 14th question,
279 and that part of it relating to publication in the Herald of
about 20th December, 1879, did you make one or more replies to that article and publish them?

Ans. I believe something was said, but I don't recollect what now.

X Int. 46. What newspapers did you publish the replies in?

Ans. I don't know any particular newspaper. I believe I wrote to several newspapers. I think the very day that account of Edison's was published I sent the same article to every newspaper in New York.

X Int. 47. Do you remember what newspapers published your article?

Ans. I think the Sun and the Tribune, or some other paper, but am not certain. I was continually writing to the papers. Can't remember any particular article published in any particular paper.

X Int. 48. Did you subsequently and in a short time furnish one or more additional articles upon the same subject, which were published in the Sun?

Ans. Very likely I did. Refer to my previous answer with regard to my constantly writing to the newspapers.

X Int. 49. Referring now to your 17 answer, could a lamp, as described there, which would burn from one second to ten minutes, be used in competition with gas or other commercial lights?

Ans. It could not; and at that time the invention was not so perfected in all respects, including the inclosing globe and mechanism, as to make the lamp suitable for any practical purpose. By mechanism, I mean the general construction of the lamp, method of sealing, conductors, &c. That is all the attachments of the lamp and the general mechanical construction of the lamp.

X Int. 50. Referring now to your 18th answer, could a lamp as described there, which would burn from 5 to 100 hours be used in competition with gas or other commercial lights?

280 A. I think not.

51 X Q. Have you ever produced an electric incandescent

lamp with a paper-carbon conductor, which could be used in competition with gas or other commercial light?

A. We have produced a lamp of the kind described, as capable of competing with gas as any other electric lamp produced with an incandescent paper carbon; I refer to heated carbons.

52 X Q. When, and where did you produce such a lamp?

A. At 94 Walker street, substantially the same as in Exhibit No. 4, (Sawyer exhibit), referring to the copy of the drawing, making part of the application for the patent. This was between the 20th October, 1878, to the 20th January, 1879. We had this lamp perfected before Mr. Lawrence Myers left.

53 X Q. How long did any of the lamps referred to in the previous answer, actually burn?

A. One or two of them burned, I think, about 100 hours. The majority of them would fracture in about 5 hours Nineteen-twentieths of them would fracture in about 20 hours. That is, of course, run up to the temperature which would give about 25 candle light. That is about 5 times the light the Edison and Maxim lights were usually run at.

Redirect examination by Mr. BROADNAX:

54 Q. Referring now to the lamps referred to in answer to 53 X Q. Please state whether or not those lamps are fitted with the same kind of paper carbons that you made at 43 Centre street?

A. Some of them were, and some were treated with gas-retort carbon. Most of them were fitted with paper carbon. We were treating those lamps to get the greatest durability possible. The treatment was the same, except we substituted liquid hydrocarbons for gaseous.

281 Int. 55. During your experiments at 43 Centre street, was Wm. H. Church a frequent visitor there?

Ans. Yes.

Int. 56. Did he witness those experiments with a prospect of interest in the invention?

Ans. I can't say what experiments Mr. Church witnessed He was there every day, in and out. Don't remember what his prospective interests in inventions were.

W. E. SAWYER.

Counsel for complainant offers in evidence printed Patent Office copies of the specifications and drawings of the following letters patent of the United States granted to Thomas A. Edison on the dates hereinafter given, to wit:

214,636,	dated	April 22, 1879.
214,637,	"	" " "
218,866,	"	August 26, 1879.
219,628,	"	Sept. 16, 1879.
224,329,	"	Feb'y 10, 1880.
227,227,	"	May 4, "
227,228,	"	" " "
227,229,	"	" " "

and the same are marked, Complainant's Exhibits Edison Patents Nos. 1 to 8, February 2, 1889. It is hereby stipulated that the production of copies of the grant of said patents and certifications of said copies is waived, and that the same may be used with the same force and effect as duly certified copies, subject to correction at or before the hearing by the production of certified copies.

Each and every said patent objected to as immaterial and irrelevant by counsel for defendant. Defendant's counsel objects to the offer of the alleged depositions of William Sawyer and William E. Sawyer as incompetent, immaterial and irrelevant, and for the further reasons stated at the end of the previous offer of these same depositions. 282

The offer of Exhibits No. 1, No. 2, No. 4, and No. 10 objected to as incompetent, immaterial, and irrelevant, and because it does not appear that said Patent Office proceedings were between the same parties, or their privies, as in this suit, or that the issue was the same, and because said exhibits appear in the offer to be but a partial record of the proceedings referred to.

Complainant hereby closes its evidence in reply.

283 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY *against* THE MCKEESPORT LIGHT COMPANY.	In Equity. No. 5. May Term, 1888.

To Amos Broadnax, Esq., and Leonard E. Curtis, Esq., of counsel for complainants.

GENTLEMEN: Take notice, that on Wednesday, February 20th, 1889, at 11 o'clock in the forenoon I shall proceed to take (*de bene esse*) the testimony of George W. Sawyer, as a witness for the above defendant, before William T. Farnham, notary public, at the Mitchel house, corner of Broadway and Forty-second street, in the city of New York, according to the statutes in such case made and provided, said George W. Sawyer being a resident of the city of New York, living at a greater distance from the place of trial than one hundred miles, and being infirm. The examination will be continued from day to day until completed. You are invited to be present at the time and place named to cross-examine the said witness.

Dated New York, February 19th, 1889.

RICH'D N. DYER,
Of Counsel for Defendant.

Service of a copy of the above acknowledged February 19, 1889.

LEONARD E. CURTIS,
Of Counsel for Compl't.

AMOS BROADNAX,
Of Counsel with Complainant.

284 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
against
THE MCKEESPORT LIGHT COMPANY.
In Equity. No. 5. May Term, 1888.

To Thos. B. Kerr, Esq., solicitor for complainant:

SIR: Take notice, that on Wednesday, February 20th, 1889, at 11 o'clock in the forenoon, I shall proceed to take (*de bene esse*) the testimony of George W. Sawyer, as a witness for the above defendant, before William T. Farnham, Esq., notary public, at the Mitchel house, corner of Broadway and Forty-second street, in the city of New York, according to the statutes in such case made and provided, said George W. Sawyer being a resident of the city of New York, living at a greater distance from the place of trial than one hundred miles, and being infirm. The examination will be continued from day to day until completed. You are invited to be present at the time and place named to cross-examine the said witness.

Dated New York, February 20th, 1889.

RICH'D N. DYER.

Service acknowledged February 20th, 1889, at 10:20 o'clock a. m.

THOMAS B. KERR,
Solicitor for Compl't.

285 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
vs.
MCKEESPORT ELECTRIC LIGHT COMPANY.

United States Circuit Court, Southern District of New York.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
vs.
THE EDISON ELECTRIC LIGHT COMPANY and THOMAS A. EDISON.

STATE OF NEW YORK,
City and County of New York, } *ss:*

Be it remembered that on this 20th day of February, in the year of our Lord one thousand eight hundred and eighty-nine, I, William T. Farnham, a notary public in and for the city, county and State of New York, under and by virtue of the statutes of the United States in such cases made and provided, did call and caused to be and personally appear before me, George W. Sawyer, pursuant to the annexed notice, at the Mitchell house, on the corner of Broadway and Forty-second street, in the said city of New York, in said county and State, to testify and the truth to say on the part and in behalf of the defendant in certain suits, or matters of controversy, now depending and undetermined 286 in the circuit court of the United States for the western district of Pennsylvania, wherein The Consolidated Electric Light Company is complainant and The McKeesport Light Company is defendant, and in a suit or matter of controversy now depending and undetermined in the circuit court of The United States for the southern district of New York, wherein The Consolidated Electric Light Company is complainant and The Edison Electric Light Company and Thomas A. Edison are defendants.

Present: Thomas B. Kerr and Amos Broadnax, counsel for complainant, The Consolidated Elec. L't'g Co., Walter K. Griffin, Esq., and Richard N. Dyer, Esq., for the defendants The McKeesport Electric Light Company and the defendants The Edison Electric Light Co. and Thomas A. Edison.

Also present: Albon Man.

And the said GEORGE W. SAWYER, being about the age of twenty-seven years, and having been by me first cautioned and sworn to testify the truth, the whole truth and nothing but the truth in the matter of controversy aforesaid, I carefully examined the said George W. Sawyer, and he did thereupon depose, testify and say as follows, viz:

Counsel for complainant requests counsel for respondent to permit Dr. Charles A. Bucklin, residing at 206 West Forty-second street, and who is now present, to examine the witness on behalf of the complainant with reference to his physical and mental condition before the examination proceeds.

Counsel for defendants accede to the request.

(Dr. Bucklin was then permitted to enter the room and examine into the witness' condition, being in the presence of counsel for both the complainant and defendants.)

287 Examined by Mr. GRIFFIN:

1 Q. What is your name, age and present place of residence?

A. My name is George W. Sawyer; age twenty-seven; I am at present residing in the Mitchell house, New York city, under medical treatment.

2 Q. Are you the George W. Sawyer who is the brother of William Edward Sawyer, one of the joint patentees of the patent in suit, and are you also the George W. Sawyer who, before this, testified in certain interference proceedings between Messrs. Sawyer and Man and Mr. Edison in the Patent Office?

A. I am.

3 Q. Please look at the book marked for identification "Defendant's Exhibit A, Feb. 20, 1889," and state whether you recognize the same, and whether you have examined it (handing book to witness)?

A. Yes, sir.

Defendant's counsel requests of record that the notary mark the book for identification, as stated in the question to the witness.

4 Q. With the exception of pages 49 to 56 inclusive, and the first

eight lines of page 57, in whose handwriting are the various entries in the book?

A. The other handwriting is my brother's, William E. Sawyer.

5 Q. Please look at the entries on pages 123 to 129 of the book, and state in whose handwriting the entries on those pages are?

The question is objected to as immaterial and incompetent, unless the book is going to be offered in evidence.

A. It is all my brother's writing.

6 Q. Have you seen this book before, and if so, how did you first see it?

288 A. It came to me through my brother, in some way, at some different times; it was left in my care; anyway, I came by it, and I have had it.

7 Q. How long, how many months or how many years?

A. I have had the book since before 1880 or 1881.

8 Q. How long were you employed with your brother William Edward Sawyer in his experiments on electric lamps and similar things?

A. On all of his electrical experiments?

9 Q. Yes.

A. About 1871 or 1872—until 1881 or 1882. I won't be quite sure; there were lapses of about a year, in the meanwhile, when I might not have been with him. I first commenced with him in Washington.

10 Q. When were you with your brother in Washington?

A. In 1871 or 1872.

11 Q. Were you with your brother all the while during these years you have named, or from time to time?

A. With him most of the time—lived with my mother, my sister and myself; as a rule, most of the time.

12 Q. After you left your brother, whose employment did you go into?

A. I never was in any one's employment but his, or where he was employed.

13 Q. Were you with your brother before he became acquainted with Albon Man?

A. I was.

14 Q. And after you became acquainted with him?

A. Yes, sir.

15 Q. What part did you take with the various experiments that your brother made in electric lights, or electric lamps?

A. I was with him in most all of his experiments, assisting him, bringing apparatus to him such as he would want to use and assisting him in any way that I could.

16 Q. Do you know Hiram S. Maxim, S. D. Schuyler, James Flannigan, J. G. Smith, and others?

A. I do.

289 17 Q. Had these gentlemen any association with your brother in his experiments in a business way?

A. Yes, sir.

18 Q. Had your brother and Mr. Schuyler and Mr. Maxim any business connection?

A. Yes, sir.

19 Q. In what class of business was this?

A. In electric motors and postal telegraph.

20 Q. Do you remember any experiments made by your brother at the Coal and Iron Exchange?

A. Coal and Iron Exchange?

21 Q. Yes?

A. I do.

22 Q. How much apparatus had your brother at the Coal and Iron Exchange, for making electrical experiments?

A. A very little, only a few cells of battery, a couple of flasks with stoppers, or tubes running up through, which held a piece of carbon, and we would charge the flask with illuminating gas; that is all.

23 Q. Prior to the time that Mr. Man became acquainted with your brother, had your brother, or any one connected with him, made anything that you could call an electric lamp?

A. No, sir.

24 Q. How far had your brother got—what had he done in experimenting that way?

A. Nothing more than heating up pieces of carbon to incandescence in the air.

25 Q. What sort of carbon was this?

A. Generally lead pencil; held it up in the air.

26 Q. Do you remember E. P. Benjamin, dealer in chemical apparatus, in Barclay street, New York city?

A. I do.

27 Q. Did you ever purchase anything from him for your brother?

A. Yes, sir.

28 Q. What did you purchase?

A. Florence flasks.

29 Q. How many?

A. I don't think more than two at a time; I don't know
290 as I ever purchased more than two while he was at the Coal and Iron Exchange.

30 Q. What did your brother do with these flasks at the Coal and Iron Exchange?

A. As I said, we had a couple of uprights put up in them—conductors—to hold the piece of carbon; I think we tied the carbon around with copper wire, so as to make a connection, and there was a rubber cork in it; we took the lamp down to the Merchants' hotel—was it the Merchants' that used to be below Church street? A very old house; I don't think it is there now.

31 Q. You took them down to the hotel?

A. We took them down to the hotel, and charged them, and came up and tried them.

32 Q. What kind of gas was used in the lamp?

A. Illuminating gas; I know we were very much afraid that they were going to explode, and we wanted to get out of danger.

33 Q. How many of these lamps were burning, or tried to be brought to a light?

A. We tried both of them.

34 Q. About how long did the burning last?

A. Well, the globes became smoked so that we couldn't tell anything about it, and we opened them and looked at them.

35 Q. What kind of carbon did you use in these lamps?

A. I won't be positive whether it was this retort carbon or lead-pencil carbon.

36 Q. Do you remember about what the date of these experiments was?

A. Somewhere in February, 1878.

37 Q. Had your brother ever made any experiments with the electric lamp for incandescence before that time to your recollection?

A. No, sir; I am very sure his experiments all date from the 1st of February or latter part of January.

38 Q. Was Mr. Man present when those experiments were made?

A. Not this first one, no, sir. The first time Mr. Man was
291 present was on Washington's birthday, the 22d of February. I am very sure of that.

39 Q. And when Mr. Man was there was the experiment different from what it was before?

A. No, sir.

40 Q. After your brother moved to Centre street and while he was there, were you with him in his employ?

A. Yes, sir.

41 Q. How many flasks or lamp glasses did you buy for use at Center street, as you best remember?

A. I know that we had seventeen of them up there at one exhibition; they lasted no length of time at all; we were very glad to get the crowd out that was in there before everything would play out.

42 Q. What do you just mean by that; that you were glad to get them out?

A. Before everything would play out. It had a kind of partial success, and that was all, for probably half an hour.

43 Q. What would you do with the lamps after the people had left?

A. Take them down again. The carbons kept getting larger, and the globe darkened and the light dimmer.

44 Q. Do I understand you that you would put in new carbons after the people left?

A. Use the same carbon and recharge it.

45 Q. Recharge them?

A. Recharge them with gas.

46 Q. Was the glass plain transparent glass in these 17 or 18 globes?

A. Some of them were ground and others were transparent.

47 Q. What was your object in using ground glass?

A. To diffuse the light—show a difference.

48 Q. What kind of a machine for developing electricity did you have at Center street?

A. An Arnoux & Hochhausen machine, situated in the basement of the place when we got there; that is how we came to go there.

292 49 Q. How long did you use this machine that was situated in the basement?

A. I think only a few days; they took it away themselves.

50 Q. What did you use after that?

A. There was a Ball machine, I think, and a Weston in there, but there was nothing done with those; we used to take a lamp in there to the little shop corner of Howard and Mead—not Howard and Mead—a little corner up there that Arnoux & Hochhausen had, and they were running a machine then, trying to get one that would heat up a piece of metal so that we could use it.

51 Q. What kind of apparatus had you for conducting experiments at Centre street?

A. Only crude.

52 Q. How much; do you remember?

A. Charcoal furnace—these furnaces that they use for heating a tube—chemists use them; I don't know the name of them. They got it there to heat a tube filled with copper turnings; it didn't work. They use it for quicksilver.

53 Q. How often were you with your brother in Centre street, in the shop?

A. I was there continuously—all the time, except when out on errands, with the exception of one space of time, when I was away at Washington filing some patents for him.

54 Q. How long do you think that you were away?

A. Might have been a month, still, I don't think it was a month.

55 Q. How often would Mr. Man be at the shop in Centre street?

A. Sometimes for a short time in the morning, and again in the afternoon.

56 Q. Did he ever do any work in the shop that you saw?

A. Not much more than talking or consulting with my brother.

293 57 Q. About how many lamps do you think were made or used in Centre street during the time you were there?

A. I cannot recollect that.

58 Q. Give your best memory as to whether there was a great many or very few.

A. There were very few; we never had a great many.

59 Q. What would your idea be of a great many?

A. There may have been ten lamps put up there at Centre street.

60 Q. What difference was there between the lamps you used at Centre street and the lamp which you mentioned you had experimented with at the Coal and Iron Exchange?

A. A different way of sealing the bottom, so as to make it tight, and the conductor that went up inside, to keep it from loosening the sealing through the conduction of heat. It was a soapstone bar put in at that time; we only had the one workman working at the lamp there; that was my father.

61 Q. Were the lamps used with illuminating gas as they were at the exchange?

A. They were charged with different gas; some with illuminating gas, and then I think we had some with nitrogen; I don't know as we had any with other than illuminating gas.

62 Q. You have mentioned a stopper for the flasks or lamps; what kind of a stopper did you use at Centre street? What was it made of?

A. Glass.

63 Q. Who made the globes and covers, or caps?

A. Mr. Map got the globes from Brooklyn, I think, some place.

64 Q. And do I understand you that the globes and their fittings were not made at Centre street?

A. We had no apparatus for making glass there?

65 Q. How about the fittings; were those made there?

A. The fittings were made there.

66 Q. What kind of carbon was used in these lamps in Centre street?

A. Hard carbon, retort carbon, worked into shape.

294 67 Q. Was the resistance of these carbons high or low?

A. It was very low.

68 Q. How large were the carbons—were they large or small?

A. Well, might have been $\frac{3}{4}$ of an inch long, and filled out a sixteenth of an inch or more.

69 Q. Did you give an exhibition of these lamps in Centre street?

A. Yes, sir.

70 Q. Just state what you remember about that exhibition.

A. That was when we first went there from the Coal and Iron Exchange. I know that I was sent around to the newspaper office and telegraph—steamship companies—and invited all those different men—head men—there to this exhibition. There didn't near as many come as we expected. After they were there we started up; I think it was about three o'clock in the afternoon. We ran along until the lamps commenced to grow dimmer and dimmer, and I don't know how my brother excused them; he managed to have a reason, anyway, for shutting down and getting them out; he was very glad to get them out.

71 Q. Did you notice anything about the carbons after the exhibition was over?

A. Yes, sir; they had all increased in size.

72 Q. What remark did your brother make as regards this increase of size, if any?

A. I don't know as he made any remark—that is, to me personally.

73 Q. After the exhibition did you alter the style of fittings of your lamp at all?

A. No, sir; not the style of fittings; we were continually experimenting them at all times—made one lamp—no more than one lamp at a time.

74 Q. How did you close the lamp, as you have mentioned? What did you use to close the lamp?

A. It seems to me they had this flat stopper at this time, and fir balsam put in the joint, and the joint was clamped together; 295 there was a flange cast on the upper globe, and there was some kind of metal clamp to clamp the stopper and globe together.

75 Q. On all these lamps that you have mentioned up to the time you left Centre street do you remember any other carbon than hard carbon, or retort carbon, that you have mentioned being used?

A. No, sir.

76 Q. Did you ever see or hear of anything else being used in the lamps?

A. No, sir.

77 Q. What is the longest time that you remember any lamp burning at Centre street continuously—I mean at one time?

A. I do not believe we ever burned a lamp there over half or three-quarters of an hour at a time.

78 Q. What opportunities did you have of knowing?

A. I being there.

79 Q. Suppose visitors came there, what was your custom in showing them the lamps?

A. Turn it on; start a machine up, and turn it on. After they were in the place for half or three-quarters of an hour, then you can turn it out without them thinking much about it.

80 Q. What, if anything, would you do to the lamps after the visitors had gone?

A. If there was anything necessary we repaired it.

81 Q. What is the longest time that you remember a lamp being burned without having the carbon renewed or the globe recharged with gas?

A. I cannot recollect that, because there was none of them burned very long at a time; just what time it would figure up that they had been there I couldn't say.

82 Q. Did you ever see any carbon made at Centre street or see any substance carbonized?

A. No, sir.

83 Q. Did they have any means of carbonizing materials at Centre street?

A. No, sir.

84 Q. Was the charcoal furnace that you mentioned at all adapted for carbonizing?

A. No, sir; it was a plumber's furnace.

296 85 Q. Was there any fireplace in the room?

A. No, sir.

86 Q. How was the room heated?

A. Steam pipes.

87 Q. When you moved from Centre street to the corner of Howard and Centre what did you do there?

A. They were experimenting there on distribution. I think my brother got up a switch there and all gases for the lamps.

88 Q. Were the carbons used at the corner of Howard and Centre streets any different from the carbons used at Centre street?

A. I don't think so.

89 Q. Have you any recollection of any other carbon being used than the hard or retort carbon?

A. No, sir.

90 Q. You moved from Howard street to the corner of Walker and Elm streets, I believe, did you not?

A. Yes, sir.

91 Q. How much of the time that your brother was at Walker street were you with him?

A. I was there continually from early morning to late at night. In fact, as long as there was any one there.

92 Q. What was your employment there specially?

A. I took care of the engine there, and boiler, and ran errands.

93 Q. What machinery had they there? I mean mechanic's machinery.

A. They had a lathe.

94 Q. How many lathes?

A. One or two, and a grinding stone I think.

95 Q. Did they have any special apparatus for electrical experiments?

A. Well, they had a kind of chemical set there.

96 Q. At the shop at Walker and Elm street, how often was Mr. Man present, and what did he do?

A. He was present almost every day. Sometimes he remained for an hour, sometimes he would be there quite a while. Seeing to his own business—that occupied a great deal of his time.

297 97 Q. What class of carbon was used in the lamps at Walker street?

A. I think we got the French carbon then, but I will not be sure—I think we had a few sticks of the French carbon, but retort carbon was our principal one.

98 Q. What kind of gas, if any, was in the lamps?

A. We charged them with nitrogen gas and the vacuums.

99 Q. How much of a vacuum did you get in any of the lamps?

A. I think my brother used to claim that there was only one per cent. air left in the globes.

100 Q. What success did you have with the lamps when they had any vacuum instead of being filled with gas?

A. I don't know as we really used the vacuum; I think the method of charging our lamps was, we used to exhaust and allow the gas to flow in, and exhaust and allow the gas to flow in again and obtain the vacuum, as we called it, by dilution. Whether they used an absolute vacuum or not, we called it a vacuum because there was no air.

101 Q. Do I understand that you got rid of the air and filled the lamps with gas, so that only one one-hundredth part of air would be present in the gas?

A. Yes, sir.

102 Q. Did you see any lamps in which the air was taken out and nothing put in?

A. Yes, sir.

103 Q. How long were those tried?

A. Well, I can't state just the length of time. They were never tried very long, because they never run long. The carbon was always disintegrating.

104 Q. How did these succeed as compared with other lamps? I mean the ones with the air which you have mentioned?

A. I don't think as well as those charged with nitrogen gas. You couldn't seem to get enough vacuum.

105 Q. How did you try to get the vacuum that you did get?

A. We had a fall of water from the roof of the house—
298 I don't know what they call it—water carried up to a tank in the top of the house and through its fall by another pipe it sucks air.

106 Q. Do you remember your brother working upon what he called a feeder lamp, and if so, when do you remember his first beginning to work on these?

A. I think it was at Walker and Elm streets.

107 Q. What importance did your brother attach to the feeder lamp?

A. So that the lamp would not have to be taken apart every time in order to have the carbon replaced?

108 Q. What kind of carbon was used in the feeder lamp?

A. Retort carbon.

109 Q. Did you ever know any other kind of carbon used in the feeder lamps at Walker street?

A. No, sir.

110 Q. Was any carbonizing done at Walker street?

A. I think there was some willow twigs carbonized there, that Mr. Man brought.

111 Q. Do you remember anythin*k* else being carbonized there except willow twigs?

A. No, sir.

112 Q. What did they do with these willow twigs or sticks after they carbonized them?

A. Worked them down into the shape that they wished them, but it strikes me they never amounted to anything because they were of too high resistance for our machine, the machine would not accumulate upon them, they didn't seem to be dense enough.

113 Q. How did they work as compared with the hard carbons?

A. I can't recollect that, but not as well.

114 Q. What was the shape of these willow carbons when you used them?

A. They made them in different shapes.

115 Q. Just tell us the different shapes?

A. They were generally a straight round pencil about that length (witness indicates about three-quarters of an inch distance between his fingers).

299 116 Q. How many of these twigs do you remember being actually used in any of the lamps?

A. I can't remember how many.

117 Q. Were there many or few?

A. Few.

118 Q. Did they keep on using these willow twigs?

A. No, sir.

119 Q. What did they do after they ceased to use the willow twigs?

A. They experimented continually on different forms of carbon—different shapes—different forms of lamps.

120 Q. Was this use of willow carbon experimental, or did they make any considerable number of lamps or use any considerable amount of time with the willow carbon?

A. No, sir.

Objected by the counsel for complainant on the ground that the witness is not in the position to know.

121 Q. What means of knowledge had you of the extent of the use of the willow carbons at Walker street, as you have testified?

A. Why, from seeing them put into the lamps and the lamps run.

122 Q. Could the lamps have been run without your knowledge at Walker street?

A. No, sir; not more than, maybe, half an hour at a time; not more than that.

123 Q. With the exception of the French, or retort carbon, and the willow carbon, do you remember any other kind of carbon being used at Walker street in the lamps?

A. No, sir; I remember they tried to obtain other carbons, but they met with no success.

124 Q. Just state what you mean by their trying to obtain other carbons.

A. They tried to permeate blotting paper with the lead or plumbago of a lead pencil, and then heat them up with the machine and carbonize them, which cannot be done, as a plating machine would not accumulate on a thing of such high resistance. 300

125 Q. Did you ever see carbonized paper used in a lamp at Walker street, or at Centre street?

A. No, sir.

126 Q. I don't know whether I have asked you whether you ever saw a willow carbon, or any vegetable carbon, there at Walker, or Centre street, of an arched or horseshoe shape?

A. Yes, there were carbons worked into that shape there. One in particular, I know we had. Whether we had more than one that was set up at the time, I do not know; I think we did, but I know of this one. At the time of the Edison publication of the horseshoe lamp, it was taken down and placed in the hands of the New York "Tribune" people—I think it was the "Tribune," it was some newspaper or other—but that was of hard carbon worked into that shape.

The reason this was done was on account of diffusing the light, so that it would show a larger light—the incandescent part of the carbon will show a great deal larger. I only saw this at Walker street, I didn't see it at Centre street. I thought you were talking of Walker and Elm streets.

127 Q. Did you ever see any lamp with vegetable carbon or paper carbon having the arched or horseshoe shape?

A. No, sir.

128 Q. Were these carbons you have mentioned treated, or were they used untreated?

A. Generally treated.

129 Q. What do you mean by treated?

A. Immersed in some hydrocarbon oil, or in a hydrocarbon gas—illuminating gas.

130 Q. What was then done?

A. Immersed in that, and heated up to a state of incandescence.

131 Q. Do you know your brother's habits, as to applying for letters patent for inventions he made?

A. He was very prompt if he had the money. If he had an invention, he always was very sure to raise the money as soon as he could, to obtain the patent.

301 132 Q. Who drew up the most of his specifications?

A. Himself.

133 Q. What were his means during the time he was in Centre street and Walker street.

A. I guess they were rather limited, except what money he obtained from Mr. Man. I used to get a check once a week from Mr. Man to pay expenses.

134 Q. Did you ever know of his not applying for a patent, because he hadn't the money to apply for it?

A. No, sir.

135 Q. Did your brother at any time prior to the Edison publication in the "New York Herald" ever speak to you of paper carbon, or vegetable fibrous carbons of any kind as being important, or in any special degree useful?

A. No, sir.

136 Q. To your knowledge what carbon did he rely upon in the series of experiments you have mentioned?

A. Carbon of a very low resistance.

137 Q. What kind of material?

A. Well, carbon.

138 Q. Was it French retort, or the vegetable, or paper?

A. About all we knew anything about was the retort carbon.

139 Q. Coming down to the "Herald" publication of Sunday, December 21st, 1879, describing the invention of Edison electric lamp with the carbon horseshoe burner, did you read that article?

A. I did.

140 Q. When?

A. The same morning.

141 Q. Did your brother read it to your knowledge?

A. He did.

142 Q. What did he say in regard to that article?

A. He didn't believe it at all, it couldn't be done. There was nothing to it.

143 Q. Have you read a printed letter in the New York December 22d, 1879, which bears your brother's name, in r Mr. Edison's invention?

A. I have.

302 144 Q. Did you have any conversation with your as to what is stated in that letter?

A. No, sir; except what he had stated in it. I heard him e himself at different times about the challenge he made and th believed that he was perfectly right doing it, that he had a thing and nothing of the kind could be done.

145 Q. How many times did your brother talk in this way you about Mr. Edison's invention?

A. He never talked to me personally; generally there was my father in the office and also one of the other workmen, or Mr. Church. He would express himself to the party, not to me personally.

146 Q. Did you hear him talk this way more than once?

A. Oh, yes.

147 Q. Did your brother ever say anything to you as to whether he wrote that letter published in the "Sun," or not?

A. I know he wrote it.

148 Q. How do you know?

A. It was written by a person in Henry Darley's saloon, corner of Walker and Elm streets.

149 Q. Who dictated the letter?

A. My brother. My brother was on a little jamboree at that time, or nervous so that he couldn't write himself.

149 Q. Did you read a letter bearing the signature of your brother, published in the "New York Herald," December 24th, to which I call your attention?

(Counsel reads to witness letter referred to.) Do you remember that letter?

A. I remember that letter—yes, sir. That lamp was made at 94 Walker street.

150 Q. You mean the lamp mentioned in the letter, do you?

A. Yes, sir. That is, the carbon that was placed in the lamp, the globe may not have been made there, but the arched-shaped carbon was made at 94 Walker street.

303 151 Q. Do you know whether your brother wrote the letter published over his signature in the "Herald" of December 24th, to which I have just called your attention?

A. Yes, sir.

152 Q. Did he ever have any conversation with you or in your presence with regard to that letter, or the statements in it?

A. No, sir; but if I am not mistaken, I took that lamp and deposited it myself—put it in the hands of the "New York Tribune," not with Arnoux & Hochhausen.

153 Q. Is that the lamp that you have mentioned before as having an arch-shape carbon?

A. Yes, sir.

154 Q. Did your brother state to you his object in sending that

A. —o show that he had had the horseshoe shape, which he be-
part of
“A. I
—as the only thing that Edison was after—the shape of the

“31 . Did your brother say anything to you about any impor-
of the
e attached to the material of the burner?

“A. No, sir.

“3 Q. What was your brother doing at that time, if anything,
n the feeder lamp?

Th A. He was continually experimenting, writing at his desk, figur-
ing at his office.

157 Q. Did you read, at about the time of its publication, a letter over your brother's signature published in the "Herald" January 4th, 1884?

Counsel reads from page 455 of the printed record of complainant's exhibits in the suit of The Consolidated Electric Light Company against The Edison Electric Light Company (Exhibit B, taken from the "Herald" of January 5th, 1880).

—. Do you remember that letter?

A. I do, sir.

158 Q. Do you know whether your brother wrote
304 the letter as it was published in the "Herald" over his signature?

A. Yes, sir; I believe it was published the same as he wrote it; I have no means of knowing differently.

159 Q. Did your brother ever speak to you about writing the letter?

A. I think I was with him when he wrote the letter. I was with him mostly continuously. After he left the office, after his supper, I was at his house continually until bedtime, then I went home.

160 Q. What did your brother say as regards Mr. Edison's claims or statements as to his success with the carbon burner in his lamp?

A. Why, he never believed it.

161 Q. About this time did you see any of the Edison lamps, or see the illumination of any of the Edison lamps?

A. Yes, sir. I passed Menlo park—I think my brother sent me out there to ride by to see; how far I rode I don't remember, I think to Monmouth Junction. When I came home I told him they were burning at the park when I went and also when I came back. Then he said, they had made arrangements and started and stopped them at train time.

162 Q. I don't quite understand about starting and stopping them at train time; what did your brother say as to that?

A. He said that they started the lamps when a train would be due, and after it passed put them out; that is, they were not burned continuously.

163 Q. What did your brother say to you as to Mr. Edison's claim that he had carbonized a thin thread and that he had made a lamp in which such a thread was used as a burner?

A. He laughed at it.

164 Q. Why did he laugh at it?

A. Horse hair they called it at first.

165 Q. Do you remember a book entitled "Sawyer on E

Lighting" purporting to have been written by your brother

A. "Sawyer on Electric Lighting and Incandescence

305 166 Q. Yes, sir.

A. Yes, sir.

167 Q. Do you know whether your brother wrote that book?

A. He did.

168 Q. Going back to the exhibitions of the lamps at Centre street and again at Walker street, you testified substantially that when the visitors had gone the lamps would be turned out and the carbons, if necessary, changed?

A. Yes, sir.

169 Q. What representations, if any, did your brother make to the visitors as to the life of the lamps?

A. Well, that they would in a practical shape last forever.

170 Q. Was Mr. Man or Mr. Myers in a position to know how long the lamps actually burned?

A. Mr. Myers was not with us at Centre street.

171 Q. I mean, while he was with you at any time, was he or Mr. Man in a position to know how long a lamp actually burned?

A. Mr. Man was not; Mr. Myers was more so than Mr. Man. Mr. Myers lived out of town and was not there quite so long as the rest of us. Mr. Man was not in a position to know.

172 Q. What representations would your brother make to Mr. Man or Mr. Myers as to the lamps burning continuously?

A. Favorable.

173 Q. Did the statements that he made to Mr. Man represent the facts or not?

A. Sometimes they represented the facts, but very often they did not.

174 Q. What do you mean by "very often they did not"?

A. Well, that very often they did not represent the facts. He told about lamps running such a length of time when they hadn't.

175 Q. Did your brother ever state what his object was in making these statements to Mr. Man?

A. No, sir.

306 176 Q. You have stated that you have previously testified in the interference case, please state how you came to testify in that case.

A. That was at Mr. Broadnax's office, was it not?

177 Q. Yes, sir; I mean in the interference proceedings between Sawyer & Man and Thomas A. Edison on the paper carbons?

A. I was told I should come down there and remember this and that, that was all I would have to do; I should be questioned a little; that is all. I think I was not asked more than six or seven questions before I was out. I was cautioned what to say and what to say.

Q. Who gave you these cautions as to what to say and not to part of

"A. I think my brother.

"31 Q. Did Mr. Man speak to you as to the testimony you should of the

"A. Often.

"3 Q. What did he ask you with regard to your testimony?

A. Well, not with regard to the testimony I should give, but he Then tried to convince me that such and such was the case.

181 Q. Did your brother try to convince you also that such and such was the case?

A. No, sir.

182 Q. You stated that you were at present at the Mitchell house for medical treatment; please state how you came here and who is paying the expenses of your stay and medical attendance at this house?

A. Mr. Russell met me at Leighton, Penn., some months ago and found me in a very low condition. I told him I was not getting proper medical treatment, and that if I could go to New York and see a prominent doctor there and have a change of climate, it would be beneficial to me. He said he would see that it was done. I understand, in fact I know, that the Edison Electric Light Company is paying the expenses of my time here and medical attendance—not time, but medical attendance.

307 183 Q. You mean that they are paying all your expenses here in New York?

A. All my expenses here and my medical attendance.

As this testimony in direct has been taken in short-hand, by consent, and it being impossible for the typewriter to give counsel a copy for some time, the further examination of the witness is adjourned until to-morrow, February 21, 1889, at eleven o'clock a. m., at the same place.

MITCHELL HOUSE, 42D ST. AND B'WAY,
NEW YORK, *February* 21, 1889.

Met pursuant to adjournment.
Present, same counsel and parties as before.

Direct examination of GEORGE W. SAWYER continued by Mr. GRIFFIN:

184 Q. In your answer to the 99th question yesterday you stated that you thought your brother used to claim that there was only one-hundredth per cent. air left in the globes; what do you mean by that; how much air did you understand your brother to claim was left in the globes?

A. Well, now, I think it was that way, one-hundredth per cent., as he stated it.

185 Q. What do you mean by that?

A. One one-hundredth.

186 Q. Do you mean by that one one-hundredth part?

A. Of the entire contents of the globe was air. One o dredth—I wouldn't be sure which, now.

187 Q. When did your brother's experiments at Walker a streets end?

A. I think some time in 1879, just which date I can't now lect.

308 188 Q. What was the occasion or reason of the ex ments ending?

A. I think there was some trouble with the company, or that company hadn't the facilities for carrying out the work ther They took it to Ansonia.

189 Q. Did Mr. Man continue with your brother at Ansonia?

A. I don't recollect of Mr. Man ever being at Ansonia. I went up there before my brother two or three days, and took some lamps and other paraphernalia along.

190 Q. What class of work was your brother engaged on at Ansonia?

A. Mostly in winding and rewinding the Wallace-Farmer machine.

191 Q. Were there any experiments made on lamps, that you remember, at Ansonia by your brother?

A. Not while we were there; not while I was there.

192 Q. How long were you there with your brother, to your recollection?

A. It is a very hard thing for me to recollect now.

193 Q. Was it three months or six months, or a year?

A. No, sir; it was not—I don't think it was three months.

194 Q. Do you remember your brother making any further experiments on lamps after you gave up at the corner of Walker and Elm streets, up to the time of the publication of the Edison article in the "New York Herald"?

A. No, sir.

Cross-examination by Mr. BROADNAX, solicitor and of counsel for the complainant:

195 X Q. How did you come to be a witness on behalf of the Edison Electric Light Company in this case?

A. Through my own free will.

196 X Q. Who asked you to be a witness first?

A. I think Mr. Russell.

197 X Q. Who is Mr. Russell?

309 A. He is a gentleman that I have known for six or seven years.

198 X Q. Know him intimately?

A. Well, not very intimately; at the same time we are very friendly.

199 X Q. Was he a friend, also, of your brother, William E. Sawyer?

A. Not that I know of, sir.

200 X Q. Where was Mr. Russell when he asked you to become witness in this case, and where were you?

A. I met Mr. Russell first in New York.

X Q. When?

A. It must have been, anyway, six or seven years ago.

X Q. He didn't ask you then to be a witness in this case, of the ?

A. We were talking electric lights, and such and such goings on.

3 X Q. You said you met Mr. Russell at Lehighton?

. This last time, yes, sir.

204 X Q. How did you happen to meet Mr. Russell there?

A. I sent for Mr. Russell.

205 X Q. You sent for Mr. Russell?

A. Yes, sir.

206 X Q. By letter?

A. By letter.

207 X Q. Have you a copy of the letter you wrote to Mr. Russell?

A. No, sir, I have not.

208 X Q. Have you got the letter yourself?

A. No, sir.

209 X Q. Do you know where the letter is?

A. I don't know as I do now, because letters are something that I kept no record of whatever.

210 X Q. Why did you send for Mr. Russell?

A. On account of being in straitened circumstances, and wishing to see if I couldn't be benefited in some way or other, and knowing that he was a friend of mine, and probably could help me.

211 X Q. Did you say anything to him then about being a witness in this case?

A. No, sir.

212 X Q. Did he say anything to you about it?

A. No, sir.

213 X Q. When did he first speak to you about becoming a witness?

A. I cannot recollect.

214 X Q. What did he say to you?

A. I cannot recollect that—the words.

215 X Q. Can you give me any idea what Mr. Russell said to you when he asked you to be a witness here?

A. No, sir; but I think it was voluntary on my part.

216 X Q. In volunteering to be a witness, what did you say to him?

A. I cannot recollect the exact words, sir.

217 X Q. Give the substance of it?

A. I don't know as I could give the substance of it.

218 X Q. What arrangements did you make with Mr. Russell about testifying?

A. No arrangements whatever.

219 X Q. You came without making any arrangements?

A. Yes, sir.

220 X Q. Was Mr. Russell acting on behalf of the Edison Electric Light Company?

A. I couldn't say

221 X Q. He didn't say anything to you, then, about tes [illegible] on behalf of the Edison Electric Light Company?

A. No, sir.

222 X Q. You just came here of your own motion?

A. I came here to obtain better medical treatment than [illegible] receiving at the place where I was.

223 X Q. And you made no arrangements with him at [illegible] time, when you left Lehighton, about testifying in this case?

A. No, sir. None whatever.

224 X Q. When did you first make your arrangements with him about testifying in this case?

A. I cannot recollect, sir.

311 225 X Q. About how long was it?

A. I cannot recollect the exact time; it is impossible for me to remember.

226 X Q. I didn't ask you to state the exact time.

A. I cannot recollect any time to state a positive time when it was; I might say ten years ago, which it couldn't have been, and I might say it was five years, which it might have been.

227 X Q. Was it five years ago when you made the arrangements?

A. It might have been five years ago.

228 X Q. When you made your arrangements to testify in this case?

A. It might have been five years ago.

229 X Q. Was there any case pending then?

A. Not that I know of, sir.

230 X Q. Then it could scarcely have been five years ago?

A. I think it was all of five years ago, anyway.

231 X Q. Since you agreed to testify for the Edison Company?

A. Since I may have said anything that I could tell them that would help justice along, I was willing to do.

232 X Q. Did you tell them that?

A. I think I told Mr. Russell that.

233 X Q. Who did you tell that to—Mr. Russell?

A. I think so; yes, sir.

234 X Q. You have testified that the Edison Electric Light Company are paying your expenses here. How does that company happen to be paying your expenses?

A. I don't know; Mr. Russell said that he would try and make arrangements so that he would raise enough money to have me have the proper medical treatment here.

235 X Q. And he made the arrangements with the Edison Electric Company?

A. He made the arrangements, and since then I have ascertained myself that it was that company that were paying for my medical attendance and expenses.

312 236 X Q. And you don't know why they are paying your expenses?

No, sir, I do not.

X Q. Mr. Russell has never told you anything about that?

o, sir.

Q. And yet you are here testifying for them, and they are your expenses?

es. sir.

X Q. And you have no knowledge as to how you came to be to testify?

. Why, I think I clearly stated that I came here for proper medtreatment.

240 X Q. You came here for medical treatment, but you are here testifying for the Edison Electric Light Company and they are paying your expenses?

A. I can't see as that should signify anything.

241 X Q. That to your mind doesn't seem to signify anything, as I understand you?

—. ——.

242 X Q. Did you have any consultation with Mr. Edison's lawyers previous to your coming here?

A. No, sir.

243 X Q. Never saw any of them before?

A. No, sir.

244 X Q. All your consultations were with Mr. Russell?

A. Yes, sir.

245 X Q. Did you make an affidavit in this case before you came here?

A. No, sir.

246 X Q. Did you make one after you came here?

A. No, sir.

247 X Q. Did you make any affidavit in this case at all?

A. No, sir.

248 X Q. Did you make any statement in writing, or did you make any statement that was taken down in writing by any one about the case?

A. No, sir.

313 Counsel for the defendants states that he thinks the witness does not understand the question; that he probably refers to his coming the last time.

Counsel for the complainants states that he refers to his coming at any time.

The WITNESS: I was under the impression that you meant since I came here for this medical treatment; I supposed you were talking about the last time.

249 X Q. How did the gentlemen who examined you yesterday get a long typewritten statement from which he conducted your examination?

A. That, I think, was from a statement that I made some five years ago.

250 X Q. Where was that statement made?

A. In New York.

251 X Q. To whom?

A. To Mr. Tomlinson, I think.

252 X Q. Counsel for the Edison Company?

A. I don't know whether he was counsel for the Edison Co or not. I was not well acquainted with any of these parties

253 X Q. Whereabouts were you when you made these ments?

A. I think at their place in South Fifth avenue, or Fifth av wherever the company's place is. I cannot recollect now; n Fourteenth street.

254 X Q. Do you mean to be understood as saying that you mad your arrangements to testify in this case with Mr. Tomlinson, five years ago?

A. I merely made a statement of facts that I knew; made no arrangements to ever testify in it.

255 X Q. Did you have no understanding with Mr. Tomlinson that you would testify to the facts that you gave to him for his client?

A. When I told him that I knew those facts, I said I would make them known at any time that they wished me to; that is all the answer I should consider that required.

314 256 X Q. What did Mr. Tomlinson give you for the certificate you made to him at that time?

A. Nothing, sir.

257 X Q. Did he make any arrangements to give you anything?

A. I think my expenses were paid while I was here in New York; that, I believe, was all.

258 X Q. Who brought you here at that time to make that statement to Mr. Tomlinson; I mean at whose request did you come here?

A. On my own request, first, until I met Mr. Russell.

259 X Q. Did you go and see Mr. Tomlinson of your own motion?

A. No, sir; I was in straitened circumstances, myself.

260 X Q. And you went to see Mr. Tomlinson to get money?

A. No, sir; I didn't see Mr. Tomlinson at all; I saw Mr. Russell.

261 X Q. Did Mr. Russell help you out of your straitened circumstances?

A. Yes, sir.

261½ X Q Who furnished the money?

A. I couldn't state who furnished the money.

262 X Q. What is Mr. Russell's name in full?

A. James; that is all that I know of. He has a middle letter, but I don't remember now just what it is. James A., I think; I wouldn't be sure, though.

263 X Q. When did you say you made his acquaintance first?

A. When did I say I made his acquaintance first?

264 X Q. Yes.

A. It might have been five or six years ago; I think it was all of that.

265 X Q. Was that the time you had your first interview with Mr. Tomlinson?

A. No, sir; I had met Mr. Russell before, long before that.

Q. Was Mr. Russell in the employment of the Edison Electric Light Company?

A. That I couldn't say. I never knew whom he was employed by.

X Q. Did you make your arrangements with Mr. Russell, or the arrangements made for your interview with Mr. Tomlin- through Mr. Russell?

A. Through Mr. Russell?

268 X Q. Through Mr. Russell?

A. Yes, sir; through Mr. Russell.

269 X Q. How was that brought about?

A. I couldn't say.

270 X Q. Did Mr. Russell first see you about having an interview with Mr. Tomlinson?

A. No, sir; I first saw Mr. Russell, not about having an interview with Mr. Tomlinson personally, but with the Edison Company.

271 X Q. What was said between you and Mr. Russell at the time of that conversation?

A. It is so long ago that I cannot recollect now.

272 X Q. What was the substance of your interview?

A. I couldn't state.

273 X Q. Cannot you state what was said that brought you to testify, or to make your statement to Mr. Tomlinson?

A. No, sir.

274 X Q. Why did you go to see Mr. Russell, and where did you go to see him?

A. I think I have already stated that I went to see Mr. Tomlinson or Mr. Russell because I was in straightened circumstances and wanted to see whether I could raise a little money for myself—borrow it from him, or if he could borrow it from somewheres for me.

275 X Q. And did he borrow it from somebody for you?

A. I don't know whether he borrowed it or not. What I wanted I got—the small sum that I wanted.

276 X Q. How much was it?

A. I will not state.

277 X Q. Do you refuse to state how much?

A. That was a matter of private business of my own; I don't think it concerns this case in any way at all.

316 278 X Q. You are not the judge of that; we are the judges of that. You will please to answer my question—state how much?

A. It may have been $100; it may have been less or it may have been more.

279 X Q. How much was it, as matter of fact?

A. I cannot recollect the exact sum.

280 X Q. State as near as you can recollect.

A. I have.

281 X Q. You cannot state the amount?

A. No, sir; I cannot.

282 X Q. You cannot state it approximately?

A. I cannot.

283 X Q. Is your testimony which you have given now cordance with the statement you made to Mr. Tomlinson time?

A. I don't understand you, Mr. Broadnax.

284 X Q. Is the testimony which you gave yesterday and to- so far, in accordance with the statement you made to Mr. Toml son some four or five years ago?

A. I think so.

Before closing the examination of this witness, counsel for the complainant ask the question whether the book which was shown the witness and identified by him, but not submitted to counsel for the complainant, is to be offered in evidence, and an opportunity given to examine this witness in regard to the same, both as to the writing which he has identified, and as to his possession, and as to the nature of the contents.

Defendant's counsel says, that the book is marked for identification only, and refers the complainant's counsel to the record, whereby it will appear that no question as to the contents, and no proof as to the accuracy or truth of the contents was asked or required from the witness, but simply an identification of the contents, whatever they may be, as being in the handwriting of the witness' brother, William E. Sawyer.

317 Counsel for the complainants object to questions 3 to 7, as incompetent, unless the book is offered in evidence and the witness submitted to cross-examination, and they give notice to the counsel for the defendants, that in view of the refusal to produce the book and permit examination of the witness in regard to the writing which he has identified in reference to certain pages, as well as in reference to the contents of the book, and his possession of it, that at 10 o'clock on Saturday, February 23d, a motion will be made before the court, in Pittsburgh, to strike out so much of the testimony of this witness as relates to said book.

285 X Q. You have stated that you were examined as a witness in the interference between Thomas A. Edison, on the one side, and Sawyer and Man on the other; have you read your deposition in that case recently?

A. No, sir.

286 X Q. Has it been read to you?

A. No, sir.

287 X Q. Do you know what you testified to in that case?

A. I think I can recollect pretty well, but I won't be sure that I can; it is so long ago; I know it took place in your office and was very short.

288 X Q. I find your deposition in that case printed among the exhibits in the case between The Consolidated Electric Light Company, complainant, and The Edison Electric Light Company and Thomas A. Edison, defendants, pending in the United States circuit court for the southern district of New York, and numbered 3553,
-position being as follows:
part of
"A. I rge W. Sawyer, a witness called on behalf of Sawyer and
"31 ing duly sworn, and interrogated by Mr. Broadnax, testi-
of the follows:
"A.
"32 Q. What is your name, age, residence and occupation?
"A. My name is George W. Sawyer; am twenty-three
Th years of age; reside at Earle's hotel; my occupation is working for the Eastern Electric Manufacturing Company.

"2 Q. Please state where you were employed during the months of October, November and December, 1878.

"A. 94 Walker street, by the Electro-Dynamic Light Company.

"3 Q. State whether you are acquainted with Wm. E. Sawyer and Albon Man.

"A. I am, with both of them.

"4 Q. State what relation you are to either of them, if any.

"A. Brother of Wm. E. Sawyer.

"5 Q. State whether or not, during that time you were employed at 94 Walker street, you saw there in operation what is known as the Sawyer and Man electric lamp.

"A. I did.

"6 Q. State what your duties were at the works of the Electro-Dynamic Light Company at 94 Walker street.

"A. Employed to take care of the boiler and engine and operate them.

"7 Q. State whether or not, during the time you were employed there, you saw Mr. William E. Sawyer or Albon May carbonize any paper for the purpose of making carbon burners for their electric lamp.

"A. Yes.

"8 Q. Which of them?

"A. Mr. Man.

"9 Q. Who assisted Mr. Man?

"—. Edwin L. Meyers.

"10 Q. Where is Edwin L. Meyers?

"A. Dead, I believe.

"11 Q. How did Mr. Man corbonize the paper?

"A. By first cutting the paper to the proper shape; then put it in the retort made of fire-clay or graphite; one was made of fire-clay and one of graphite; put it in the boiler furnace and made it red hot; then took it out and let it cool gradually; then took the carbons out and used them in the lamp. 319

"12 Q. Did you see him put them in the lamps?

"A. Yes.

"13 Q. Which month was it you saw them do this?

"A. In the latter part of October, and in the months of November and December.

"14 Q. What shape was the retort?

"A. One, I believe, was three-cornered, and one was round; was about five or six inches long; they put the papers in the retort and then filled up with powdered carbon.

"15 Q. How many lamps did you see them put these carb

"A. A number of them. I could not say how many.

"16 Q. Did you see those paper carbons illuminated in the

"A. Yes.

"17 Q. How long were they illuminated?

"A. I can't say how long; I did not pay any especial atte to that.

"18 Q. State, as near as you can recollect, how long you had be at work at 94 Water street before you saw Mr. Man carbonizin paper as you have stated?

"A. Very shortly after we moved there; how long I cannot say.

"19 Q. Was it a week or two weeks?

"A. Think it was about a week; it is very shortly after we moved there.

"20 Q. Did you see Mr. Man or your brother, Wm. E. Sawyer, making, or causing to be made, any carbonized paper for burners for their electric lamps at any other place besides 94 Walker street, and if so, where?

"A. I think at 43 Centre street, in April or March.

"21 Q. Were you employed at 43 Centre street?

"A. Yes, sir.

"22 Q. In what capacity?

"A. As an errand boy.

"23 Q. Did you see them carbonize the paper?

"A. No, sir.

320 "24 Q. Did you see the paper after it was carbonized there?

"A. Yes.

"25 Q. How do you know that the paper was made of carbon?

"A. They laid it on the table, and I was told they were carbonized paper.

"26 Q. Who told you they were carbonized paper?

"A. My brother, Wm. E. Sawyer.

"28 Q. Did you see any of these carbon burners that your brother told you were made of carbonized paper used in the electric lamps at 43 Centre street?

"A. We had several lamps in use there, but I don't know whether the carbons used in the lamps were made of paper or not.

"28 Q. Was it at the time that your brother, W. E. Sawyer and Albon Man were experimenting with their lamps at 43 Centre street that your brother told you that the carbons were made of carbonized paper?

"A. Yes, sir.

"Cross-examination by Mr. DYER, of counsel for Mr. Edison:

"29 X Q. Then you do not know of your own knowledge that any carbonized-paper conductors were made at 43 Centre street?

"A. No, sir.

"30 X Q. Where was the boiler-room at 94 Walker street—what part of the building?

"A. In the northwest corner of the workshop.

"31 X Q. Was all the carbonizing done there done in the furnace of the boiler?

"A. Yes, all that was done in the shop.

"32 X Q. Were other things carbonized besides paper?

"A. Yes.

"33 X Q. What other things?

"A. Willor twigs.

"34 X Q. Anything else?

"A. Not that I remember.

321 "35 X Q. What was the proportion of the paper to the twigs?

"A. Could not say.

"36 X Q. How far away from where you were working were the materials prepared for carbonization?

"A. Perhaps twenty feet.

"37 X Q. Did you see any paper packed in retorts for carbonization at that shop?

"A. Yes.

"38 X Q. Who packed it?

"A. Mr. Man, and Mr. Edwin L. Meyers.

"Redirect examination by Mr. BROADNAX:

"39 Re-D. Q. State, if you recollect, what kind of paper was used for carbonization?

"A. Paper that looked like blotting paper.

"GEORGE W. S. SAWYER."

Q. Did you give that testimony?

A. I testified in the interference case at Mr. Broadnax's office, and what you have quoted is my testimony in that case.

Counsel for complainant request and demand that defendant's counsel furnish them with a copy of the statement made by the witness to Mr. Tomlinson, as stated by him in his deposition, four or five years ago, and upon which they examined the witness upon his examination-in-chief, in full sight of the counsel for the complainants.

It is consented between counsel that the examiner, Mr. Farnham, may sign the witness' name to the deposition.

GEORGE W. SAWYER.

Sworn to before me,

WILLIAM T. FARNHAM.

[L. S.] *Notary Public, County and State of New York.*

I hereby certify that the name of the witness, George W. Sawyer, was signed by me pursuant to the consent hereinbefore entered on the record.

WILLIAM T. FARNHAM,
Notary Public, County & State of New York.

322 I, William T. Farnham, a notary public in and
county of New York, in the State of New York, do
certify that the annexed deposition of George W. Sawyer wa
before me in the cause now pending undetermined in the
court of the United States for the western district of Pennsy
on the equity side of said court, wherein The Consolidated El
Light Company is complainant and McKeesport Light Compa
defendant, on the part of the defendant; that said deposition
taken under the notices hereto annexed at the time and place there
named and was continued from day to day as appears in said deposition, until concluded; that the parties to the cause named in the caption of said notices were present at the taking of said deposition, the said complainant by its counsel Amos Broadnax and Thomas B. Kerr and by Albon Man and the said defendant by its counsel Richard N. Dyer and Walter K. Griffin, as therein appears; that before deposing said Sawyer was by me first duly cautioned and sworn to tell the truth, the whole truth and nothing but the truth in said cause above named; that said deposition was reduced to writing by Mary F. Seymour and William C. Huson, who acted as amanuenses for me by consent of said counsel; that the signature of the witness to the deposition was waived by consent of counsel present for the respective parties and it was consented between said counsel at the close of said deposition that I subscribe the same with the name of the witness; that I did so subscribe the witness' name to the deposition; that the notice under which said deposition was taken was due and reasonable notice and was given by the party taking it to the solicitors for the complainant and stated the name of the witness, the time and place of taking the deposition and the reasons for taking it *de bene esse*; that said witness lived at the time of taking his deposition at the city of New York, a place distant more than one hundred miles from the place of trial of the cause above named; that said witness was very infirm at the time of taking his deposition and has since died, his death occurring Feb-
323 ruary 25th, 1889, about 2.30 o'clock a. m., as appears to me by a certificate thereof hereto annexed of the health department of the city of New York; that said witness was examined on the direct examination by Walter K. Griffin, Esq., on behalf of the defendants, and was cross-examined by Amos Broadnax, Esq., on behalf of the complainants.

I have retained the said deposition in my possession for the purpose of forwarding the same to the United States circuit court for the western district of Pennsylvania, the court for which the same was taken.

That I am not of counsel for either of the parties to the cause or interested directly or indirectly in the event of the cause.

In testimony whereof, I have hereunto set my hand and seal this 29th day of March, 1889.

WILLIAM T. FARNHAM,
[L. S.] *Notary Public, County and State of New York.*

nited States Circuit Court, Western District of Pennsylvania.

ONSOLIDATED ELECTRIC LIGHT COMPANY
against
ME McKEESPORT LIGHT COMPANY.
In Equity. No. 5. May Term, 1888. On Letters Patent 317,676.

Thomas B. Kerr, Esq., 32 Nassau street, New York city, N. Y.:

Take notice, that on Saturday, the 23d of February, 1889, at the office of Messrs. Dyer & Seely, No. 40 Wall street, in the city of New York, at 11 o'clock in the forenoon of that day, counsel for defendant will proceed to put in defendant's testimony and proofs under the order of the court herein, dated February 18th, 1889, and will continue from time to time by adjournment until they have fin d putting in such proofs and testimony as they may wish to adduce under said order. Complainant's counsel are invited to be present.

RICH'D N. DYER,
Of Counsel for the Defendant.

Dated New York, February 21st, 1889.

Receipt of copy acknowledged Thursday, February 21, 1889, 4.25 p. m.

T. B. KERR,
Compl't's Solicitor.

325 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
against
THE McKEESPORT LIGHT COMPANY.
In Equity. No. 5. May Term, 1888.

Proofs taken in behalf of defendant before William T. Farnham, special examiner herein, under the orders of the court dated respectively February 18th and 21st, 1889.

NEW YORK, *February 23d*, 1889.

Met pursuant to notice.

Present: R. N. Dyer, Esq., and Walter K. Griffin, Esq., on behalf of defendant, and Amos Broadnax and L. E. Curtis, Esqs., on behalf of complainant.

JOHN M. D. KEATING, being duly called and sworn on behalf of defendants, testifies as follows:

1 Q. What is your name, age, residence and occupation and how long have you been in such occupation?

A. John M. D. Keating; age, about sixty-eight years; I r

Harlem, New York city. I am and for forty years or mo

been a machinist model-maker doing business all the while

city of New York.

326 2 Q. Did you do any work for Wm. E. Sawyer dur

time he was at 43 Centre street, New York, in the sp

1878, and if so please state the class of work you did for him.

A. Well, the class was general experimenting on a varie

things.

3 Q. How frequently to your best recollection were you in

shop or workroom in Centre street?

A. Occasionally, just when I was called for; sometimes he would have something for me to do and would send for me.

4 Q. Had you known Mr. Sawyer before he was at 43 Centre street?

A. I think I did because I knew him before I commenced to do anything for him.

5 Q. Were you in Mr. Sawyer's shop at any other times than when you went in after work or jobs?

A. Occasionally, yes.

6 Q. Did you ever call on him at the shop socially?

A. Yes, sir.

7 Q. How often?

A. I could not say; just when convenient.

8 Q. When Mr. Sawyer moved to 94 Walker street were you ever in his shop there?

A. At the corner of Elm? Yes.

9 Q. How often?

A. When I had occasion to go there on business and sometimes socially.

10 Q. Do you remember their moving there; if so, what fact caused you specially to remember it?

A. The fact that I was about locating myself elsewhere, and I thought that would be a good location—in the same building—I thought.

11 Q. Have you a mechanic's shop of your own, and did you have this at the time you knew Mr. Sawyer?

A. I have been in business for the last thirty-five or forty years, as I stated before. I had a shop stock of tools and everything for the business.

327 12 Q. How often would you be around to Sawyer's shop in Walker street; was it once a day or once a week, or how often?

A. Sometimes once a day; sometimes twice a day if I went in the morning; then again probably once or twice during the week. I was not there every day once or twice a day; you must understand me.

13 Q. How long would you stay in the shop on your visit?

A. Long enough to get my order for the work they wanted me to do.

14 Q. Did you ever stay there socially; if so, how long?

A. I would frequently drop in socially; would probably stay a
" 30 S r.

"A. I alker street alight and burning; if so, how often?
" 31 ly one—once, a short time.
of the Did you ever ask to see the lamps burning?
"A. did.
" 32 Q. What answer did you get?
It was not convenient, or if I could call in some other time.
That is all I could get. That is the answer I got.

18 Q. What were your personal relations with the Sawyers outside of your work for them?

A. Nothing but that I was acquainted with the old gentleman—that's all—his father.

19 Q. Have you any knowledge in any way of what the Sawyers used inside of their lamps?

A. I did not.

20 Q. Had you any knowledge as to whether they used carbon of any kind?

A. , sir; I have my ideas that they must have used carbon, that they h to have carbon of some sort.

21 Q. I understand that you don't know anything about the kind of carbon?

A. No, sir.

22 Q. How many places of business have you had since the year 1879 up to the present?

328 A. Well, I don't think I have changed my place of business more than four or five times since I begun in business for myself.

23 Q. Where was your place of business at the time you were doing work for the Sawyers?

A. That is a question I can't answer without I refer back to my receipts to show where my location was.

24 Q. Was your name in the New York Directory?

A. John M. D. Keating. My name has always been in the directory since I have been in business up to the present time.

25 Q. Are you a man well known in the trade in the city of New York?

A. Very well in my line of business.

26 Q. Has there been any difficulty in finding you or your place of business?

A. Not if people are intelligent enough to read the directory.

27 Q. Were you well known amongst the machinists in the neighborhood of your shop from time to time?

A. Yes, sir.

Cross-examination by Mr. Broadnax:

28 X Q. What, if any, knowledge have you of the science of electricity?

A. Very little; only see the results; that is all.

29 X Q. What do you mean by your last answer?

A. Not being familiar with electricity.

30 X Q. What, if any, industrial application did you ev
of electricity?

A. Only to fill orders from customers for parts and parcels
class of work as experiments principally. I don't know an
of the principles of electricity, not being familiar with the p
ples.

31 X Q. Do you mean that you as a mechanic have merely m
different mechanical devices according to the directions of others
be used by them for different purposes in electrical apparatus?

A. Yes, that is correct.

329 32 X Q. What kind of jobs did you do for Mr. Sawyer?

A. A variety of little traps. I made a variety of little traps for him.

33 X Q. Do you know Albon Man?

A. Partially; I am not particularly acquainted with him. I think I have done a little work for him; I forget what it was.

34 X Q. Did you ever see Albon Man around the shop, at 43 Centre street or 94 Walker street?

A. I don't remember of ever seeing him there, only at his office, where he was agent for the Lorillard estate or some estate. I think so; I feel certain this was in Mercer street.

35 X Q. Did you go there to see Mr. Man at his office?

A. I did.

36 X Q. What took you there?

A. To deliver a little piece of work and get my money—that's all.

37 X Q. What was the piece of work?

A. That I could not state.

38 X Q. Was it a piece of work you had made for Mr. Man, or a piece of work you had made for Mr. Sawyer or by his direction?

A. I do not know about that. It may have been something for Mr. Man's private affairs, but I don't know what it was.

39 X Q. How intimately were you acquainted with Mr. Sawyer?

A. Only socially.

40 X Q. Did you visit his house?

A. No, sir.

41 X Q. Do you mean that you only met him occasionally in a social way?

A. When called upon to do some work for him. I never made it a business to run after him. I would call in and say, "Well, Mr. Sawyer, any work to do?" And Mr. Sawyer would say, "Perhaps I may have a little drawing for you to-morrow."

330 Redirect:

42 Re-D. Q. Did Mr. Sawyer inform you whether any of the work you did for him was for electrical purposes?

A Only to my own judgment and observation; seeing that he
“30 Xing on lamps, I was in no way inquisitive about his
part of
“A. I D. Q. What kind of an outfit did the Sawyers have, at
“31 Street I mean; was it a large or a small outfit of tools? What
of the remember seeing in the shop as to the tools and ma-
“A. ?
“32According to the general appearance of the place the facilities
quite limited to do any kind of extensive business. The tools
Th quite limited, perhaps one or two small foot lathes at that time
en I was there—when I called there.

44 Re-D. Q. What means of power, if any?

A. They had—all I saw there was a small upright engine and boiler about, as I should judge, from four to six horse power.

45 Re-D. Q. Do you remember about the size of the room at Walker street?

A. I should judge about fifteen feet wide, about eighteen feet wide, perhaps twenty-five or thirty feet deep—long. The boiler and engine stood in a small recess off from the room in one corner.

Recross:

46 Re-X Q. Did the shop consist of two rooms or one?

A. Well, now, that's a question—I don't know. They had a small partition in the main room—probably about six or eight feet high. Whether this makes two rooms of it is a question.

47 Re-X Q. Wasn't there a front room right on the corner of Walker and Elm streets and then, in addition, wasn't there a back room siding on Elm street, and wasn't there a door leading from one room into the other—from the front room into the back room?

331 A. I think there was, where they had the tools to work in there so as not to have it appear so in the front office.

48 Re-X Q. Was not most of the mechanical work done in the back room?

A. I presume so, as I did not go in there.

49 Re-X Q. Was not the boiler and engine set in a hallway partitioned off of the back room?

A. I couldn't say; it was off that room on the side—a sort of recess. It was not in the main room, anyway.

JOHN M. D. KEATING.

Sworn to before me.

WILLIAM FARNHAM,
Special Examiner, Notary Public.

It is stipulated between counsel that a copy of the foregoing deposition, certified as correct by the examiner, may be filed and used by the defendants, The Edison Electric Light Co. and Thomas A. Edison, in the suit pending in the southern district of New York, between the complainant herein and said defendants, with the same force and effect as if said deposition had been taken in said suit before one of the standing examiners of the court.

Adjourned till Monday, the 25th inst., at 11 a. m.

MONDAY, *February 25th*, 1889—11

Met pursuant to adjournment.

Present, counsel as before, and the taking of testimony was adjourned till 2 p. m. of the same day.

332 MONDAY, *February 25th*, 1889—2 p.

Met pursuant to adjournment.

Present, counsel as before, and the taking of testimony herein wa adjourned till to-morrow (Tuesday), the 26th inst., at 2 o'clock p. m.

NEW YORK, *February* 26, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer and E. H. Rogers, Esq., for defendant, and L. E. Curtis and T. B. Kerr, Esquires, for complainant, also present Albon Man, Esq.

WILLIAM HOCHHAUSEN, a witness, subpœnaed on behalf of defendant, and duly sworn, testifies as follows:

1 Q. What is your name, age, residence and occupation?

A. William Hochhausen, 48 years of age; I reside in Brooklyn; I am at present superintendent electrician of the Excelsior Electric Light Co.

2 Q. How long have you been connected with electrical enterprises as an electrician?

A. Since the year 1858, with an intermission of two years; there were three years; 1864, 1865, and 1866.

3 Q. What was your business connection in 1878?

A. I carried on the business of making electrical machines with Anthony Arnoux, who had become my partner in December, 1877.

4 Q. You were a member of the firm of Arnoux & Hochhausen?

A. I was.

5 Q. Were you actively engaged in the manufacturing business of that concern?

A. I was.

6 Q. How long was that business continued under your management?

A. Till December 31st, 1880.

7 Q. Where was the shop of that firm located during the years 1878, 1879, and 1880?

333 A. Till May, 1878, our shop was at the corner of Reade and Centre streets; in May, 1878, we moved to the corner of Howard and Centre; we stayed in this place till May, 1880, and then moved to Twentieth street, between Second and Third avenues; I don't recollect the number.

8 Q. Were you, in 1878, acquainted with William Edward Sawyer and Albon Man, the inventors named in the patent in suit?

A. Yes; I was.

9 Q. When did you first know them?

I became acquainted with Mr. Sawyer when he had some busi-
A. I the Coal and Iron Exchange, in connection with Mr. Schuy-
63 Q it was in 1877; Mr. Man, I became acquainted with in 1878;
A. I it was in May.
them . Where did you meet Mr. Man?
heard orner of Howard and Centre.

Q. That is, at the shop of Arnoux & Hochhausen?

339 Or perhaps in a room which Mr. Sawyer occupied in the same ilding.

12 Q. Were you acquainted with the fact that Mr. Sawyer was working on experiments relating to electric lamps at any time during 1878?

A. I was.

13 Q. Where were these experiments being conducted, if you recollect?

A. At 43 Centre street, the latter part of February or the beginning of March, and after May 1st, in the building corner of Howard and Centre.

14 Q. Did you know of the fact that after leaving Howard and Centre street the work was continued by Mr. Sawyer in a shop at the corner of Walker and Elm street?

A. I do know that. I have been there several times during the time they were experimenting there.

15 Q. Why do you fix the date that Sawyer was at 43 Centre street as in the latter part of February or the beginning of March. Might it not have been a somewhat later date?

334 Objected to as leading, and the constant reference to Sawyer alone in the questions of counsel is objected to as an attempt to betray the witness into separating unconsciously the experiments of Sawyer from those of Mr. Man, his joint inventor of the invention of the patent in suit.

Counsel for defendant suggests that the statement made by counsel for complainant in the presence of the witness is hardly proper. He disclaims any intention of misleading the witness and proposes to give the witness full opportunity to state what he knows of Mr. Man's connection with the experiments.

A. We had a machine at 43 Centre street for the purpose of adjusting electric lamps and electric lights in general. We placed it in the engine-room of this building the beginning of February and took it out about the middle of March. During this time Mr. Sawyer used the current of this machine repeatedly for his experiments.

16 Q. How have you ascertained the date when you removed that machine from 43 Centre street?

A. From memory.

17 Q. You have not consulted the books of Arnoux & Hochhausen in order to fix the date exactly?

A. I have not; nor would I need it.

18 Q. When Sawyer's shop was at the corner of Howard and Centre, in which building, I have understood you, your own sho was, how often did you go into Sawyer's shop?

A. Quite frequently.

19 Q. How near together were the two shops?

A. Sawyer's shop was right below our own office.

20 Q. Did Sawyer or any of the workmen make use of you at that time?

A. Yes, they did.

21 Q. To what extent, and how frequently?

A. They got permission from us, probably for a mone
335 consideration. As Mr. Arnoux managed the finances, I don
recollect what was paid. They used part of our shop as a workshop for several months, but not every day during the time.

22 Q. Do you mean that they had this permission while their shop was adjoining yours?

A. Yes; their own shop was too small to accommodate several men.

23 Q. What do you mean by the statement that they used your shop?

A. They used some of our tools and shop room.

24 Q. Did they have a separate part of your shop, or did they simply use your tools on your regular benches?

A. They used a certain corner of our shop, but it was not partitioned off.

25 Q. Who went in there, to work in your shop?

A. Chiefly Mr. Sawyer's father.

26 Q. Do you recollect any other workman?

A. Yes.

27 Q. Who was it?

A. I don't know his name. He wasn't there long.

28 Q. Any other that you recollect?

A. Sawyer's brother was in repeatedly. He was not actually working there.

29 Q. Do you recollect the brother's name?

A. Not this minute. I can't think of his name just this minute. Of course, I know it very well.

30 Q. Was it not George Sawyer?

A. Yes, that's so; George.

37 Q. What was the character of work that was done by Sawyer's father and the other workmen, whose names you do not call to mind, in your shop?

A. They made parts of incandescent lamps.

32 Q. Do you recollect what these parts were?

A. Carbons, clamps for the same, and the conductors leading to these clamps, also lamp bottoms.

33 Q. What was the kind of work done on carbons that you recollect, in your shop?

A. Chiefly forming their cylindrical sticks, also some flat curved plates V-shaped.

34 Q. How were these sticks and plates formed?

336 A. Chiefly of gas-retort carbon.

35 Q. What was done with the gas-retort carbon in form-
A. I sticks and plates?
63 Qieces were cut off with a saw from a lump of gas carbon
A. I were got to the proper shape by filing and sandpapering.
them a. This cutting and sandpapering of the carbons was the
heard ter of work, as I understand it, that you saw done in your
on carbons?
339 jected to as improper and leading.
Question withdrawn.)

37 Q. What other kind of work, if any, did you see them do in your shop on carbons?

A. I saw them making clamping blocks.

38 Q. How were these made?

A. They were also filed into shape.

39 Q. What kind of carbon were these blocks made from?

A. Gas-retort carbon.

40 Q. Did you see them cutting and filing any other kinds of carbon in your shop, either for burners or clamps?

A. No.

41 Q. Did you see any other work done on carbons in your shop, except the filing and cutting of burners and clamps from gas-retort carbon?

A. No.

42 Q. When Sawyer's shop was at 43 Centre street, how often did you visit the shop?

A. Probably six times.

43 Q. During that time did Sawyer or anybody connected with him visit your shop?

A. Yes.

44 Q. Who were the people, and how often did they come?

A. I can recollect but Mr. Sawyer and a certain Mr. Hays. Mr. Hays paid a bill; that is how I recollect his name.

45 Q. Was he an old man or a young man?

A. An old man, I think.

337 46 Q. How often did Sawyer come to your shop during the time he was at 43 Centre street?

A. Repeatedly.

47 Q. Did he do any work or make any experiments at your shop during that time?

A. Once he did something which might be called an experiment. He lighted an incandescent lamp using the current from a dynamo which I had wound specially for a nickel-plater in Wooster street.

48 Q. What did he do at other visits to your shop?

A. During one visit he ordered a machine. At another time he requested us to alter the speed of the dynamo which was running at 43 Centre street. Besides that we talked about electric lighting in general during his visits.

49 Q. When you visited his shop, did you also discuss electric lighting matters with him?

A. Yes.

50 Q. Did these discussions between you and Mr. Sawy
tinue after Sawyer's shop was moved to Howard and Centre s

A. Yes.

51 Q. And also after Sawyer's shop was moved to Walk
Elm.

A. I have seen Mr. Sawyer very seldom after he moved to W
and Elm.

52 Q. Did he not call upon you occasionally after that time?

A. He did, but not often.

53 Q. Did Sawyer have any work done at your shop while h
was at Walker and Elm upon electric lamps?

A. No.

54 Q. On the occasions that you met Sawyer while his shop was at Walker and Elm, did you not continue with him your discussions as to electric lighting?

A. Yes.

55 Q. Have you made any inventions relating to electric lighting yourself, if so, how long have you been at work on that general subject?

A. I have taken out a number of patents for electric light-
338 ing devices. I made my first dynamo for electric lighting in 1875.

56 Q. Did you see any of Sawyer's electric lamps and carbons during the time that he occupied any of the three shops that have been referred to?

A. I have seen some.

57 Q. How often did you see them?

A. A few dozen times, probably.

58 Q. Did you see any carbon or carbon burners in his shops during this time?

A. Yes.

59 Q. What kind of carbons did you see there?

A. Mostly straight pencils, also some V-shaped carbons.

60 Q. Did you see any of the rough material from which these carbon burners were made?

A. Yes; I have seen a lamp of gas-retort carbon, to which I have referred in a former answer as having seen it in the building corner of Howard and Centre. I have also seen a lot of French carbons, each one being one meter long and one millimeter in cross-section.

61 Q. What was the character of these French carbons, if you know, and whose make were they?

A. They were either Gaudouin's or Carre's. I thought they were Gaudouin's. As far as I know these carbons were made up by mixing powdered carbon of good quality with some adhesive substance, squeezing that substance through a die and drying and baking.

These formed sticks afterwards. Gaudouin kept his way of manufacturing carbons a secret.

62 Q. With the exception of these French carbon pencils and the block of gas-retort carbon, what other kind of rough material for making carbon burners did you see at Sawyer's shop at any time?

A. I have seen charcoal pencils.

63 Q. Where did you see the charcoal pencils?

A. I have certainly seen them in Walker street. I think I saw them also at 43 Centre street. If I have not seen them there I have heard Mr. Sawyer talk about charcoal pencils which he proposed to treat in olive oil, to deposit bone carbon on them.

339 64 Q. What was it Mr. Sawyer told you about charcoal pencils?

A. Either that he had made them or was going to make them.

65 Q. How make them?

A. File a piece of charcoal down thin, put the two ends in the clamps, to which wires were fastened, immerse them then in olive oil and heat them to incandescence while in the oil by the passage of an electric current.

66 Q. Was this all he said to you about the charcoal pencils?

A. That is all I recollect at present.

67 Q. Do you recollect seeing yourself any charcoal pencils made into burners for Sawyer's lamps?

A. I am not sure of that. I have seen lamps burning which were said to contain such carbons, but I can't say for certain whether they did or not.

68 Q. When were you told that any such lamps had the charcoal pencils?

A. I think I heard of it at first during the latter part of Sawyer's stay at 43 Centre street.

69 Q. Did you ever see any carbonized-paper burners at any of the shops occupied by Sawyer?

A. Not that I am aware of.

70 Q. Did you ever hear of such burners during the time that Sawyer was carrying on his experiments?

A. He may have mentioned it, but I do not recollect it; I had a conversation with him once about incandescent light conductors, and mentioned to him that the superintendent of a gas company had come to me in 1877 with a lamp containing a strip of asbestos cloth impregnated with carbon which he requested me to bring to incandescence by electric currents; did not have at that time a machine developing sufficient electro-motive force to bring the strip to incandescence, as the resistance was very high, and as the party could not spare the money to have a proper machine built, his scheme was dropped, as I suppose. We also spoke of another incandescent lamp, the incandescent body being composed of 340 kaolin impregnated with carbon. Kaolin is a kind of clay. At that time he may have spoken of paper carbons.

71 Q. Do you recollect that he did speak of paper carbons?

A. I heard him speak later on of paper carbons, I mean in later years. So that I should be afraid to state that I heard it at the time mentioned, as my recollection might be influenced by what I heard afterwards.

72 Q. What do you mean by "later years," as to time?

A. The year 1879, for instance.

73 Q. Do you mean after or before it was known that Mr. Edison was using paper carbon in his lamps?

A. It was probably after Edison published something about lamps.

74 Q. Did you understand generally what was used in the made by Mr. Sawyer at the time you saw them at his shops?

Objected to as incompetent.

A. As far as I understand, the majority of lamps contained artificial carbon, a carbon made of the residue of gas retorts.

75 Q. How many of Sawyer's lamps did you see at any of his shops containing burners of gas-retort carbon?

Objected to by Mr. Kerr as incompetent. I don't understand that the witness has testified of his own knowledge what kind of carbon was inside of the lamps.

A. I have no positive knowledge about the nature of the burners in the lamps which I saw lighted.

76 Q. How about the lamps that were not lighted which you saw?

A. I have seen very few indeed, in the shop besides those which were on exhibition, and of those I am not positive what kind of carbon they contained.

341 77 Q. What is your best recollection as to the character of carbon contained in the lamps which you did see and examine?

A. It is that most of them either contained carbons made of the residue of gas retorts or the French carbon pencils spoken of in a former answer.

78 Q. Do you recollect seeing at the time of its publication the article in the "New York Herald" of December 21, 1879, of which I show you a copy? (Counsel shows witness the copy already in evidence.)

A. I do.

79 Q. Do you recollect any published replies to this article purporting to come from Mr. Sawyer?

A. I do.

80 Q. Do you recollect an article in the "New York Herald" of December 24, 1879 (counsel reads to witness Exhibit A, page 453 of complainant's exhibits, in the suit of the complainant *vs.* The Edison Electric Light Co. *et al.*, pending in the southern district of New York, case No. 3553)?

A. I do.

81 Q. Is the statement contained in the publication as to a lamp being put in the hands of Messrs. Arnoux and Hochhausen true?

A. It is true. The lamp was placed in the hands of my partner, Mr. Arnoux, by Mr. W. E. Sawyer himself.

82 Q. What became of the lamp?

A. A day or two after it was placed in Mr. Arnoux's hands, either Mr. W. E. Sawyer himself, or his brother, called on Mr. Arnoux, and both went out with the lamp to take it to some newspaper office, to the "Tribune," I think.

Q. Did Mr. Sawyer say anything to you as to whether he had
A. I the letter in the "Herald" of December 24, 1879, which I
63 Q lready read to you?
A. I Iis signature was under the letter so I understood it was
them a by him. So far as I know he has not denied having
heard n the letter.

339 oss-examination by Mr. KERR:

84 X Q. How soon after the publication of the "Herald" 42 article of December 21, 1879, did Sawyer bring you the lamp?

A. At an early hour the next morning.

85 X Q. What did he say to you?

A. He did not speak to me directly. He spoke to my partner, Mr. Arnoux. Mr. Arnoux was in the office close to the entrance. I was in the next room. The door was open, so I heard what was said. He was quite excited; said he wanted to deposit the lamp which anticipated Edison into the hands of an unbiased party—a disinterested party so that he would be able to prove that the lamp was made before this article was published. That was the drift of his conversation.

86 X Q. Please state particularly any words he used?

A. I don't think it possible for anybody to remember the words which were made use of in any conversation which took place even only a few years ago. One does not listen to the words but to the sense.

87 X Q. Did he say what kind of a carbon was in that lamp?

A. As he claimed the lamp to be an anticipation of the lamp which Edison describes in his article I infer that it must be a lamp just as the one described in that article.

88 X Q. Didn't he in fact say that that lamp had a paper carbon in it?

A. He may have said so, but I do not know; I do not recollect that.

89 X Q. Did you examime the lamp?

A. Yes; not very closely. It had a V-shaped carbon, flat and very thin.

90 X Q. Did it look like a paper carbon?

A. I did not have any experience at that time in such matters, so I could not tell. If I could see it now I would be able to tell.

91 X Q. Didn't Sawyer say something about Edison's having stolen the invention?

A. I don't recollect any such statement.

92 X Q. Did he say when that lamp was made?

A. A long time prior to the day he brought it to us.

343 93 X Q. Did he say anything about paper carbons at that interview?

A. I should think he did, as he spoke about this "Herald" article.

94 X Q. Did he say anything about his having used paper carbons?

A. I am not sure that he did.

95 X Q. Did he say anything about his having used ve
carbons or fibrous carbons?

A. I knew long ago that he professed to have made veg
fibrous carbons.

96 X Q. I now show you the drawing of the patent in su
ask you if the lamp he brought to Mr. Arnoux was like that

A. It was, in general appearance, except that the carb
sketched far too thick there. The width is all right. I refe
figure 4 of the drawing shown me.

97 X Q. To what occasion in 1879 did you refer in answer
question 72, as being the time when Sawyer spoke to you abou
paper carbons?

A. To the time he brought this lamp to Mr. Arnoux.

98 X Q. Was there no other occasion in 1879?

A. I cannot point out any just now.

99 X Q. When was it that Sawyer professed to have made vegetable fibrous carbons and where?

A. As I stated before, he spoke about treating willow charcoal in oil—charcoal pencils are made of willow—I have always understood it so; I may be incorrect about that, as I stated before; it was in 1878, during his stay at 43 Centre street.

100 X Q. Did he speak of treating willow charcoal?

Counsel asks that the word willow be underscored.

A. Yes; he spoke of that.

101 X Q. Did he say that was what he meant by vegetable fibrous carbon?

344 Objected to because the witness has not stated that Mr. Sawyer used the words vegetable or fibrous carbon, but that he talked of treating willow carbons, which the witness in his previous answers stated to be vegetable fibrous carbon.

Counsel for complainant suggests that the statement of counsel for defendant would be more correct if he would bear in mind the witness' answer 95.

A. He relied on the fibre as probably giving him a carbon of more durability than those made of gas-retort carbon.

102 X Q. You do not catch my question. It is, did he say that willow charcoal was what he meant by vegetable fibrous carbon?

A. He may have meant something else, for all I know.

103 X Q. Did he tell you how he carbonized the willow?

A. Yes.

104 X Q. What did he say?

A. Carbonized it in olive oil.

105 X Q. Did he mention any other method of carbonizing vegetable fibrous material?

A. I think he mentioned hydrocarbon oils—other hydrocarbon oils; I think he got the best results at that time with olive oil.

106 X Q. Did he speak to you about making the charcoal in a retort with powdered carbon around the material to be carbon-

A. I hink he did.

63 Q Q. Did he never speak to you about carbonizing paper in
A. I.?

them a may have done so, but I am not sure of it.

heard Q. Did you ever see any carbonized paper in any of the
hops you have mentioned?

339 None has been pointed out to me; I may, for aught I know.
have I was not aware of it.

)9 X Q. You are not prepared to say that there was none there.
A. No.

45 110 X Q. Are you prepared to say that none of the lamps you saw at Centre street contained paper carbons?

A. No, I could not say that they did not.

111 X Q. Are you prepared to say that none of the lamps you saw in use at Centre and Howard street- contained paper carbons?

A. No; I could not pretend to know all about their experiments and methods of making carbons.

112 X Q. Are you prepared to say that none of the lamps you saw in use at Walker and Elm streets contained paper carbons?

A. I am not prepared to say that.

113 X Q. I understand that you saw lamps in use at all three places. Is that correct?

A. That is correct.

114 X Q. How did these lamps work—well or poorly?

A. They worked very well while I saw them.

115 X Q. Did you see arch-shaped carbons at all three places in use in lamps?

A. I do not think that I saw any arch-shaped carbons in 43 Centre street, but I have seen them in the building corner of Howard and Centre and also corner of Walker and Elm.

116 X Q. How did those arch-shaped lamps work?

A. While I saw them burning they were very good lamps. I have not been there longer than perhaps from a quarter to half an hour.

117 X Q. How many lamps did you see in operation at any one time?

A. About six lamps—the largest number I have ever seen burning at any one time, both at the corner of Howard and Centre and Walker and Elm. At 43 Centre I have never seen more than four burning at the same time.

118 X Q. About how many times were you there when the lamps were burning; I mean at all three places?

A. At least twenty times.

119 X Q. Weren't you told that some of these lamps contained vegetable fibrous carbon burners?

A. Yes.

346 120 X Q. Who by?

A. E. W. Sawyer, William E. Sawyer.

121 X Q. Did he point out any particular lamp or lamps as containing any such carbon?

A. I think he did, but as the carbons were in an incandescent state I could not tell whether such statement was true or not.

122 X Q. Had you any reason to doubt it then?

A. Not particularly.

123 X Q. Can you state whether the lamps which he pointed out as containing vegetable fibrous carbons had arch-shaped burners?

A. No; I am not sure whether the carbons he pointed out were straight or arch-shaped.

124 X Q. Isn't it a fact that some were straight and some were arch-shaped?

A. Yes; some were straight and some were arch-shaped.

Adjourned till Wednesday the 27th inst., at 11 a. m.

WEDNESDAY, *Feb. 27th*, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer, Esq., for defendant and Thomas B. Kerr, Esq., and L. E. Curtis, Esq., on behalf of complainant, also present Albon Man, and the examination of Mr. HOCHHAUSEN was continued as follows:

125 X Q. Under what circumstances did you become acquainted with Mr. Man?

A. He was introduced to me by Mr. Sawyer as being interested in his enterprise.

126 X Q. Where?

A. In the building corner of Howard and Centre. I had probably seen him before that time but had no knowledge that he was interested with Mr. Sawyer.

127 X Q. Did Sawyer & Man rent their shop corner Howard and Centre from Arnoux & Hochhausen?

A. They did not rent their own shop from us which was
347 below ours, but I think they rented from us shop room in
our shop.

128 X Q. When did they rent shop room from you?

A. In the early summer, the latter part of June or July.

129 X Q. Did Sawyer & Man purchase any dynamo machinery from your firm?

Objected to as not proper cross-examination, the question not being based on anything brought out by the direct.

A. They did.

130 X Q. Please state what and when?

Same objection.

A. The first dynamo bought was a machine capable of developing a current of about fifty amperes and an electro-motive force of about fifteen or twenty volts. At this time I did not know that Mr.

Man was connected with the concern. A second dynamo was purchased of a larger capacity, perhaps two and a half times the capacity of the first. The first was bought while Sawyer occupied the premises in 43 Centre street, and the second after he had moved to Walker and Elm.

131 X Q. What was the capacity of that second machine?

Same objection.

A. From fifty to sixty volts, and about the same current strength as the other.

132 X Q. Who paid for the first machine?

Same objection.

A. Mr. Hays.

133 X Q. What was his Christian name?

Same objection.

A. I don't recollect his Christian name.

348 134 X Q. Did you ever see that machine running at 43 Centre street?

Same objection.

A. I did.

135 X Q. About the second machine; who purchased that?

Same objection.

A. Mr. Man.

136 X Q. When was that machine ordered; when they were at 43 Centre street or after they had moved to Howard and Centre?

Same objection.

A. After they had moved to Howard and Centre.

137 X Q. Are you positive about that?

Same objection.

A. I am positive that we did not do any work on the second machine before we were in the building corner Howard and Centre. That makes me believe that it was not ordered before.

138 X Q. Did you ever lend them any dynamo machines?

Same objection.

A. Yes; we lent them several at different times?

139 X Q. Please state what machines you lent them, where they were located at the time, and where the machines so lent were used by them?

Same objection.

A. The first one of our machines of which they utilized the current when we did not need it ourselves was located in Centre street, 43, during the latter part of February and March.
349 After moving to the building, corner of Howard and Centre, they obtained a current from various dynamos

we had on the floor. The first machine so lent was capable of developing a current of fifty ampéres and electro-motive force of a hundred volts and over. The machines made use of by them in the building, corner of Howard and Centre, had a capacity of about eighty ampéres and fifty volts electro-motive force, our ordinary machines for the production of large single arc lights.

140 X Q. Didn't you lend them one or more machines for use in the shop, corner of Walker and Elm streets, while you were building their second dynamo?

Same objection.

A. We did.

141 X Q. How many and of what capacity?

Same objection.

A. I can think of but one. It was one of our large single arc-light machines of eighty ampéres and fifty volts.

142 X Q. Did you ever rewind any machines for them; and, so, when and why?

Same objection.

A. Yes; we rewound machines. The armature had burned out because excessive current had been developed. The first machine they bought from us was rewound, I believe, while the premises at 43 Centre street were still occupied by Mr. Sawyer. I think we rewound the same machine afterwards again when we were in the building, corner of Howard and Centre.

143 X Q. Didn't you rewind the second machine purchased by them?

Same objection.

A. I don't recollect that we did.

144 X Q. Please explain what is meant by "excessive
350 currents had been developed" in your 142d answer?

Same objection.

A. Owing to low resistance of the external circuit the development of current was abnormally large and the wires heated to such an extent that the insulation of them was charred.

145 X Q. I wish you would explain how the low resistance of the external circuit, which resulted in the burning of the machine, was obtained?

Same objection.

A. It was obtained by placing a number of incandescent lamps in parallel or derived circuit.

146 X Q. Is that the same as multiple-arc arrangement ot lamps?

Same objection.

A. Yes, sir.

147 X Q. What factor of the current was changed when the excess was developed?

Same objection.

A. The volume of the current strength.

148 X Q. Did the voltage of the current remain the same?

Same objection.

A. The voltage was very slightly altered.

149 X Q. How?

Same objection.

A. Slightly increased.

150 X Q. Did you not lend Sawyer & Man several machines for use at 43 Centre street, at different times?

Same objection.

351 A. I do not recollect having lent them other machines besides the large arc-light machine we had on the premises, 43 Centre street.

151 X Q. Do you recollect having lent them a machine which you had built for a man on Wooster street?

Same objection.

A. They had made use of this machine in our own shop, corner of Reade and Centre. I do not recollect that they ever had it at 43 Centre.

152 X Q. How large was Sawyer & Man's shop at Howard and Centre streets?

A. Probably twenty by fifteen feet.

153 X Q. Was all the work which was done in your shop by Sawyer & Man, or the workmen, work requiring mechanical tools?

A. Mostly, if screw-drivers, files, and such things answer to the term used in the question.

154 X Q. What do you mean by "mostly"? Did they do any work in your shop which did not require mechanical tools?

A. While assembling lamps certain operations are performed by the hand unaided by tools.

155 X Q. Did they assemble lamps in your shop?

A. They did.

156 X Q. What were these operations which were done by hand in assembling lamps in your shop?

A. Placing carbons between clamps for instance; placing the bottom of the globe or the glass receptacle, and similar operations.

157 X Q. Was it their custom to assemble all their lamps in your shop at Howard and Centre streets?

A. No; they had work done outside too.

158 X Q. Do you know what work they had done outside?

A. The glass-work, also most of the brass-work was done outside. Filling the lamps with gas was done in their own room in the same building.

159 X Q. Do you know whether they had a circuit run from your shop to their own room?

A. They had.

352 160 X Q. Did they get the current from your shop?

A. They did.

161 X Q. Do you know what use they put it to in their shop?

A. They lighted lamps.

162 X Q. Do you know of any other use?

A. No; I do not.

163 X Q. Isn't it your recollection that they used the current for treating carbons and other purposes?

A. They may have done so, but I do not recollect having seen it.

164 & 165 X Q. Do you recollect of having heard of their doing so?

A. I had heard of their treating carbons before that time.

166 X Q. Do you recollect that a man by the name of Miller had a room upstairs?

A. There was a firm in the building, Mueller & Neuman.

167 X Q. Do you recollect that a circuit was run from your shop up into Mueller & Neuman's room?

A. The same circuit which ran into the room occupied by Sawyer & Man was run through portions of the premises of Mueller & Neuman, as it was the handiest way to run the circuit, they occupying all of the floor below us except the room belonging to Sawyer & Man.

168 X Q. Did you ever hear of Sawyer & Man doing any work in Mueller & Neuman's room?

A. I have a faint recollection that they did.

169 X Q. What kind of work?

A. I think they used a forge there.

170 X Q. Don't you know of their having carbonized vegetable fibrous materials there?

A. I think that is what they did.

171 X Q. Do you recollect for what purpose?

Objected to on the ground that the question assumes that the witness knew of such carbonizing being done of his own knowledge, which fact does not yet appear.

353 A. To use them as the incandescing body in lamps, I suppose.

172 X Q. Did you ever see Sawyer & Man's carbonizing apparatus?

A. I do not remember that I did.

173 X Q. Was it ever described to you?

A. One process was described to me, as I have testified before.

174 X Q. I mean the apparatus for carbonizing vegetable fibre in a furnace.

A. Do you refer to the apparatus used by Sawyer?

175 X Q. Yes; by Sawyer, or Sawyer & Man.

A. I do not recollect having heard any description of such an apparatus from them. I knew how to carbonize animal or vegetable substances for quite a long time, having had occasion to use such carbons for other purposes.

176 X Q. What other purposes?

A. Making coal charcoal from leather for the purposes of case-hardening iron.

177 X Q. And do you regard that as the same thing as carbonizing the burners for incandescent lamps?

A. Just the same thing.

178 X Q. What was the shape of the leather you used, and what was its form when it came out of the carbonizing apparatus?

A. Leather such as old boots, and other refuse of leather was cut up in small pieces, placed in an iron box, which consisted sometimes of a piece of gas pipe, large pipe. If a pipe was used, both ends were closed up by discs of iron, luted with clay to keep the air out, and the whole was subjected to a strong heat for a number of hours. The carbonizing shriveled the pieces up.

179 X Q. Were the pieces packed in powdered charcoal when they were put into the box?

A. No; as there was no occasion to preserve shape, this would have been superfluous. When I answered before as to the operations resulting in the same, I meant this to cover the nature of the carbon produced, irrespective of shape.

180 X Q. Did you ever see Sawyer & Man, or either of
354 them, or any of their workmen, carbonize incandescent lamp burners?

A. While passing through Mueller & Neuman's shop for the purpose of inspecting some work which they did for us, I have seen some person or persons interested or employed by Sawyer & Man, or the Sawyer & Man electric light enterprise, working in a forge fire carbonizing something, as I now think.

181 X Q. Can you give me any description of the apparatus he was using?

A. They seemed to have a rectangular iron box in the fire.

182 X Q. Was he blowing up the fire?

A. I don't know whether he was blowing at the time, but the fire was burning.

183 X Q. Did you stop and ask him what he was doing, or have any conversation with him about it?

A. I am not certain about that.

184 X Q. Did you ever see Sawyer and Man or either of them or any of their workmen treating carbons?

A. I can't say that I did.

185 X Q. When did you first hear of them treating carbons?

A. I have answered that before. It was while Mr. Sawyer occupied the premises at 43 Centre street.

187 X Q. In answer to question 42, you say that you were in Sawyer's shop at 43 Centre St., probably six times. What were you there for?

A. Several times I went there to see him about the working of the machine he bought. A few times before this to caution him not to start circuit over electric light machine, so it should not be in danger of being burned up. Several times I took people round to the shop that inquired for him.

188 X Q. At the time you had your conversation with Sawyer when you told him about the superintendent of the gas company, isn't it your impression that Sawyer spoke to you about carbonizing paper, and was not that what led you to tell him about the superintendent of the gas company's asbestos lamp?

355 A. Such might be the case, but I could not say it was an absolute fact.

189 X Q. Well, isn't it your impression that he mentioned carbonizing paper at that time?

Objected to as leading, also as immaterial.

A. I think it is likely that he did.

190 X Q. Is Mr. Arnoux alive?

A. He is not.

191 X Q. When did he die?

A. In July, 1884.

192 X Q. Please describe the Sawyer & Man rooms at Walker and Elm streets?

A. I have seen three of their rooms. I do not know how many more they may *may* have had. They were quite large.

193 X Q. When in answer to question 116 you say, I have not been there longer than perhaps from a quarter to half an hour, do you mean altogether or at any one time?

A. I mean at any one time.

194 X Q. Did you have any conversations with Mr. Man about incandescent lamps during 1878?

A. Yes, repeatedly.

195 X Q. Did he ever say anything to you about using paper carbons in the lamps at any of those conversations?

A. I am not certain whether he did or not.

196 X Q. Did he ever say anything to you about the use of vegetable fibrous materials in the lamps during any of those conversations?

A. I had heard that they used such material. I may have heard it from either or both of them.

197 X Q. Do you remember of Mr. Man being present on one occasion when Mr. Sawyer was pointing out the lamps to you?

A. Mr. Man was generally present when I visited their rooms and very likely was present when the lamp spoken of was pointed out to me.

Adjourned till 2¾ p. m.

356 Resumed at 3¾ p. m.

198 X Q. Do you remember any occasion when you were in Sawyer & Man's shop, and Mr. Man was present and in conversation with you and Sawyer, that Sawyer pointed out one or more lamps as being lamps containing paper carbons?

A. I do not.

199 X Q. What was the business of Arnoux & Hochhausen during the years 1878 and 1879?

A. Making dynamo-electric machines, for electric lighting and electroplating purposes; also for the production of electric lights, and arc lamps for the same purposes.

Redirect examination by Mr. Dyer:

200 Re-D. Q. Did Mr. Sawyer ever speak to you about vegetable fibrous carbon in terms or did he simply mention charcoal?

A. He spoke of vegetable carbon as being a fibrous substance. He seemed to expect more strength from the fibrous nature of vegetable carbon.

201 Re-D. Q. As I understand your testimony, you have stated that Mr. Sawyer spoke of filing and cutting charcoal down to the form of a pencil and then treating charcoal pencil in olive oil. Did you understand that this was the character of the carbon in the lamp or lamps which Mr. Sawyer, you think, subsequently pointed out to you as containing the vegetable fibrous carbons?

Objected to as leading and suggestive to the witness and therefore incompetent.

A. I understood this to be the character of some of the lamps which he so pointed out to me.

202 Re-D. Q. Is it not a fact that charcoal carbons of the kind described in my last question are the only vegetable fibrous carbons of which you have any definite and certain recollection of having heard about from Sawyer & Man prior to the date of the
357 "Herald" article of December 21st, 1879, which has before been referred to?

Objected to as grossly leading and this form of examination by defendant's counsel of his own witness is protested against by the complainant's counsel.

Question withdrawn.

203 Re-D. Q. What other kind of vegetable fibrous carbon besides that described in my question 198, if any, have you any definite and certain recollection of having heard about as being used or proposed to be used by Sawyer & Man before the date of the "Herald" article of December 21, 1879, before referred to?

A. I have no definite or certain recollection of any other fibrous or vegetable carbon than the one alluded to above.

204 Re-D. Q. Are you prepared to say whether it was or was not the intention of Sawyer or Sawyer & Man to make these treated charcoal carbons in the manner described in the following statement:

"The most perfect of all these carbons were prepared by taking sticks of fine willow charcoal and first saturating the same with syrup and subjecting to heat as in the Carré process in order to increase their conductivity. The sticks were then divided into pieces one-half an inch in length and three sixty-fourths of an inch in diameter and placed between carbon-holders for treatment. Heated to extreme incandescence and surrounded by an atmosphere of hydrocarbon, the deposit described immediately formed. The pencil with shining rounded ends was then filed on one side until the original willow was exposed, but leaving the ends of the pencil untouched. The willow being next removed a pencil of boat shape and remarkable durability was obtained."

358 Objected to as incompetent and also as improper, being a cross-examination by defendant's counsel of his own witness and also as introducing new matter into the deposition on a so-called redirect examination.

A. I do not recollect having such a process described to me by either Mr. Sawyer or Mr. Man, in all its features.

205 Re-D. Q. What features of the process stated were not described to you, if any?

A. I don't remember that I ever heard anything about filing away one side of a so formed carbon until the original willow was exposed, leaving the ends of the pencil untouched, next removing the willow, leaving a pencil of boat shape of remarkable durability.

206 Re-D. Q. Did Mr. Sawyer say anything to you which would exclude the idea that he intended to use the feature of the process referred to in your last answer in forming these carbons from charcoal?

Objected to as incompetent.

A. He did not.

207 Re-D. Q. Are you prepared to say whether or not the lamp or lamps which were pointed out to you by Mr. Sawyer as having carbons made from vegetable fibrous material had such carbons formed in accordance with the process described in Re-D. Q. 201?

A. I am not prepared to say that they had or that they had not.

208 Re-D. Q. I read to you your answers to cross-questions 119 to 124, inclusive (questions and answers read to witness). Did you mean by your answer to cross-question 124 that some of the lamps that he pointed out as having vegetable fibrous carbons had such carbons in the form of an arch, or only that some of all the lamps had arch-shaped carbons?

A. That some of all the lamps had arch-shaped carbons.

209 Re-D. Q. I read to you cross-questions and answers 170 and 171 (counsel reads questions and answers). What is the process referred to by you in answer 171?

A. The treatment in olive oil.

359 210 Re-D. Q. Are Mueller & Neumann still in business; if so, where are they located?

A. They have dissolved partnership a good many years ago; I think in 1881.

211 Re-D. Q. Do you know where either of them lives or does business now?

A. Mueller went to work in machine shops afterwards. Neumann may have business of his own yet. I don't know anything about his whereabouts. No; I do not know where Mueller lives or works at present.

212 Re-D. Q. Do you recollect the Christian names of these men?

A. No; I do not think I ever heard them.

213 Re-D. Q. Is it not a fact, Mr. Hochhausen, that I called at your place of business in Brooklyn on last Saturday and asked you to state to me the facts within your recollection relating to the experiments of Sawyer & Man on electric lamps?

Objected to as not proper redirect examination.

A. Not quite that. You made some statements to me about facts brought out by witnesses who testified in this case before. You also put a few questions to me which I thought I was at liberty to answer. Having received a retainer about a year ago from the Sawyer-Man Company I thought it would not be proper for me to say very much at the time.

214 Re-D. Q. Did I call upon you afterwards, if so, state the circumstances?

A. Yes; Monday morning Mr. Dyer brought some papers and read to me portions of the contents of them and told me that he would subpœna me to appear in this case.

215 Re-D. Q. Were you then brought here by subpœna?

A. I was.

216 Re-D. Q. What do you mean by having received a retainer from the Sawyer-Man Co.?

360 A. They sent me a check which I at first returned to them as I did not have any desire to appear as witness in any case, but they sent it back to me and I accepted it.

217 Re-D. Q. How many interviews, if any, have you had with the officers or counsel of the complainant, The Consolidated Electric Light Co. or The Sawyer-Man Co., with reference to your recollection of the experiments of Sawyer & Man?

A. One interview only, which was on last Washington's birthday, Friday. This interview took place at Mr. Curtis' office at his request. I had an interview prior to the day I received that check with Mr. Broadnax. He came to me and asked me whether I would appear as witness but he did not go into details as to my recollections.

218 Re-D. Q. Who were present on Washington's birthday at the interview in Mr. Curtis' office?

A. Mr. Kerr was present during a small fraction of the time during which the interview lasted.

Recross-examination:

219 Re-X Q. Were you ever approached or interviewed in behalf of the Edison Electric Light Co. prior to Mr. Dyer's visit to you last Saturday in reference to this case or to Sawyer & Man's operations?

A. No; but I received a letter several years ago from the Edison Company, asking what electro-motive force the machine which I had at 43 Centre street in 1878 was capable of developing. I did not know at that time why they should ask such a question. I should think now that this question would seem to have some connection with this case, providing this case was commenced at that time.

Re-redirect:

220 Re-re-D. Q. Did you answer the letter of the Edison Electric Light Co.?

A. I did.

221 Re-re-D. Q. What did you say?

361 A. I told him it was capable of giving a hundred and over volts of electro-motive force.

WILLIAM HOCHHAUSEN.

Sworn to before me,
[L. S.] WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

Complainant's counsel asks examiner to note the fact that Grosvenor P. Lowrey, Esq., was present during part of the afternoon session, on the part of the defendant, and the examiner so notes.

Counsel for defendant hereby requests the complainant through its counsel to produce at the next session the books and papers, and especially the minute books of the Electro-Dynamic Light Company, the assignor of the complainant.

Adjourned till Thursday, the 28th, at 11 a. m.

NEW YORK, *February* 28, 1889.

Met pursuant to adjournment.

Present—R. N. Dyer, Esq., and W. K. Griffin, Esq., for defendant, and L. E. Curtis, Esq., for complainant, and Mr. Albon Man.

Counsel for defendant asks counsel for complainant if he has present in his possession the books and papers of the Electro-Dynamic Light Company called for at the last session; if not, he is requested to state whether such books and papers are in the custody of the complainant or any of its officers or counsel, or, if not, whether any of the officers of the complainant or any of its counsel know where such books and papers are.

362 Counsel for complainant states that he has not present or in his possession, or under his control, any of the books and papers referred to, and he does not know where they are or whether any of the officers of the complainant or any of its other counsel know where such books and papers are, and that he was not present during the latter part of the proceedings herein on February 27th; that Mr. Kerr, who was present and has immediate charge of this case, is too ill to-day to attend to any business, and that he has had no opportunity to consult with him in regard to the matter.

WILLIAM SHARP, a witness called on behalf of defendants, and duly sworn, testifies as follows:

1 Q. What is your name, age, residence, and occupation?

A. William Sharp; about fifty-three years of age; was born July

31st, 1835. I live at 14 Pleasant place, Brooklyn; I am a chandelier-maker.

2 Q. Were you in the employment of Messrs. Sawyer & Man when they had their workshop at No. 2 Howard street, New York city?

A. Yes, sir.

3 Q. Prior to that time had you done any work for Mr. Man on any electrical apparatus?

A. Yes, sir.

4 Q. Where did you do it and what was it?

A. At my residence in Brooklyn; I believe that it was two lamps.

5 Q. Describe them?

A. Well, one was an enclosed glass with two holes at the bottom to put the working parts of the lamp through. They was put together at the holes with a kind of a clamp or washer, I should call it. Then it was screwed together. I can't exactly think how it was screwed together. There were two nuts on the bottom. I think I have given it all about as near as I can think of it.

6 Q. Did you make any burners for these lamps; and if so, state what they were?

363 A. I can't remember just what the burner was in that lamp.

7 Q. What was it made of?

A. Well, I can't just remember what it was. I can't just tell how it was put together.

8 Q. I do not refer to the metal parts, but to the burner or part to be lighted by electricity. What was it made of?

A. I believe that that was a cross-piece holding a pencil of carbon.

9 Q. What kind of carbon?

A. Retort; gas retort.

10 Q. What did you do to this gas-retort carbon, if anything?

A. I don't remember of putting that carbon in that lamp.

11 Q. Did you make the carbon?

A. No; I don't think I had anything to do with the carbon in that lamp.

12 Q. Did you do any work at Brooklyn on carbons for Mr. Man; if so, what was it?

A. I turned a small disk of retort carbon.

13 Q. State exactly everything you did to the carbon, from the beginning to the end?

A. I got a small piece of carbon and filed it down flat; then I turned the carbon to somewhere about a thirty-second part of an inch thick. It was turned to about a half an inch in diameter, I believe, with a hole in it about a quarter of an inch in diameter.

14 Q. Did you work on any other piece of carbon for a lamp, in Brooklyn for Mr. Man?

A. I don't believe I did.

15 Q. Was Mr. Man at any time present while you were at work on these lamps?

A. Yes, sir; he was there very frequently.

16 Q. Did he superintend your work?

A. Yes, sir.

17 Q. Where did you deliver these lamps?

A. I delivered those lamps to Mr. Man at my residence.

364 18 Q. About how long in all were you working on these lamps?

A. That I couldn't say very plainly.

19 Q. Is that all your answer?

A. Yes, sir.

20 Q. Would it be a week, or a month, or three months, or what?

A. I couldn't say. It might perhaps be a month or six weeks.

21 Q. How long after you finished your work on these lamps was it that you were first employed at Sawyer & Man's workshop at Howard street?

A. I couldn't say that for certain. It might perhaps be about a month.

22 Q. How large a room did Mr. Sawyer have at Howard street?

A. Well, at Howard street I couldn't say. We were working in a shop with other men, in the shop of Arnoux & Hochhausen.

23 Q. Did Mr. Sawyer have a room of his own?

A. He had a kind of an office there about ten foot square.

24 Q. What kind of furniture was in the office?

A. There was a desk or a table something similar to this (witness pointing to the table on which the master is writing). There was a chair.

25 Q. Was there any work-bench or tools for a workshop in the office?

A. Not that I know of, any further than a kind of gasometer they had there.

26 Q. Did you ever do any work in the office?

A. No, sir; I never done any work any further than to go down and see Mr. Sawyer one time. He wanted some one in the room in case anything might happen to the gasometer, or something similar to it, while he was working it.

27 Q. Who besides yourself did work for Sawyer & Man while you were there at Howard street?

A. Mr. William Sawyer.

28 Q. Where did he work?

A. I believe he worked on the same bench that I did. We were close together.

365 29 Q. Was this in Arnoux & Hochhausen's shop?

A. Yes, sir.

30 Q. Who supplied the tools for you to work with?

A. We used to use Arnoux & Hochhausen's tools, and the small tools was principally our own.

31 Q. Were you employed by Sawyer & Man while they were at the corner of Walker and Elm street-?

A. Yes, sir.

32 Q. How soon after they moved there were you working there?

A. I suppose about a couple of weeks after they had left Arnoux & Hochhausen's.

33 Q. During these two weeks where were you working?

A. I was working at Arnoux & Hochhausen's.

34 Q. For whom?

A. Arnoux & Hochhausen.

35 Q. After you went to Walker street, how long did you remain there at work?

A. I couldn't say how long I remained there. I remained there till they broke up the business.

36 Q. Were you employed by Mr. Sawyer after he left Walker street?

A. Well, I worked for Mr. Sawyer after Sawyer and Man dissolved, so far as I know of it.

37 Q. Where did you continue to work for Mr. Sawyer?

A. In the same room.

38 Q. And after that?

A. After that I went up to Ansonia with him. Mr. Sawyer made arrangements with the firm of Wallace & Sons, at Ansonia, Conn.

39 Q. While you were at Howard street and at Walker street, were you at work continuously from day to day or only occasionally?

A. I was working continuously from day to day.

40 Q. What were the working hours?

A. Ten hours a day.

41 Q. What rooms did Sawyer & Man have at Walker and Elm streets?

A. They had one large room partitioned off pretty near
366 the middle; one part was their office, the other part was the
workshop. There was a recess in the side where the water-closet, the boiler, and engine was.

42 Q. How many windows were there in the workshop?

A. Two.

43 Q. Were there any work-benches; if so, where were they placed?

A. There was one bench in front of the two windows and the chemist bench in the end of the room.

44 Q. Was this chemist bench at the partition end or the other end of the room?

A. The other end of the room.

45 Q. How did the chemist bench run—in what direction?

A. It run east and west.

46 Q. And the work-bench?

A. North and south.

47 Q. Who worked on the work-bench?

A. Mr. William Sawyer and myself.

48 Q. What part of the bench did you work at?

A. I worked on the north end of it.

49 Q. Was this the end near the chemical bench, or the other end?

A. Near the chemical bench.

50 Q. What machinery did Sawyer & Man have at Walker street?

A. They had a small dynamo, a lathe, a grindstone, a boiler and engine. I might say there were two vises in there.

51 Q. Who provided most of the tools?

A. Outside of the lathe and vises, we furnished our own tools pretty much.

52 Q. Was there any machinery in the office?

A. No, sir; not that I know of.

53 Q. What was in the office?

A. I don't remember anything further being there than a desk and a couple of chairs and a chandelier

54 Q. Did you ever see any work done in the office?

A. Nothing further than filing down some carbons.

55 Q. Where did you see this done?

A. On the end of the table.

367 56 Q. Who was doing it?

A. Edward Sawyer.

57 Q. What was your work at Walker street—what were you employed at?

A. Principally making parts of lamps.

58 Q. Who finished or mounted the lamps?

A. I believe I done a good part of it—towards the last part of it—put them together with Mr. Myer's assistance.

59 Q. Did you work on the burners?

A. Principally all burners, for anything I know. I can't designate any parts.

60 Q. What do you mean by "burners" in your answer?

A. I consider the whole concern a burner.

61 Q. What did you call the part which gave the light when heated up?

A. That is the carbon.

62 Q. Did you work on the carbons?

A. Sometimes I used to file them down, get them of proper length and size.

63 Q. What did you make the carbons from when you filed them?

A. The carbons that I filed on was filed from long strips of carbon in the shape of wire, ranging from about a sixteenth to somewhere about three-sixteenths in diameter.

64 Q. What was the name of these long strips?

A. I did not know that they had any name, further than that I understood that they were imported from France.

65 Q. What sort of carbon were they?

A. They were hard carbons, similar to what they burn in these arc lamps.

66 Q. How hard were they?

A. They were not quite as hard as glass, but they would break quite as easy.

67 Q. What was the shape of these long strips?

A. Round.

68 Q. Were they straight or crooked?

A. Straight.

368 69 Q. Take the pen and make a sketch of the size to which you filed down these carbons?

(Witness does so.)

A. I have done so, as above.

70 Q. How near does your sketch come to the size of the carbon?

A. I should think it would come in between the inside of one line and the outside of the other line.

71 Q. How about the length of the carbon?

A. I think the sketch is about the length as near as I can think of it.

Adjourned till 2 o'clock p. m.

Resumed at 2 o'clock p. m.

72 Q. When these carbons were put in the lamps on what did they rest?

A. They rested on a larger carbon point.

73 Q. What were these larger carbon points made of?

A. They were made of the crude carbon.

74 Q. What kind of crude carbon?

A. Gas-retort carbon, I believe it is.

75 Q. Did you see any other kind of carbon than the gas-retort carbon and the French carbon?

A. No, sir.

76 Q. Were any of the carbons made out of the gas-retort carbon?

A. Which carbons do you mean?

77 Q. I mean the pencils burnt in the lamps?

A. I can't remember whether there was any of them made out of the crude carbon or not.

78 Q. What do you remember seeing any pencils made out of?

A. I don't remember seeing them made of anything excepting that imported carbon.

369 79 Q. Did they use gas-retort carbon for any purposes; if so, what?

A. They used it for making the holders for these pencils.

80 Q. Who used to make the holders?

A. I think I used to make them principally.

81 Q. Who else?

A. I don't remember whether Wm. Sawyer had anything to do with making them or not.

82 Q. You have stated that you made a circular carbon for Mr. Man in Brooklyn. Did you make any circular carbons while working for Sawyer & Man, either at Howard or Walker street?

A. I made two or three while we was in Walker street.

83 Q. What tools or machinery did you use to make them?

A. Make them with a lathe, with a face plate and files and small turning tools.

84 Q. What was the size of these circular carbons?

A. I don't remember very distinctly, somewhere from a half inch to three-quarters.

85 Q. Was that in diameter?

A. Yes, sir.

86 Q. How thick were they?

A. About a thirty-second of an inch thick.

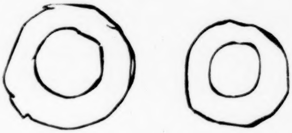
87 Q. What was the inside diameter?

A. That is something I don't distinctly remember.

88 Q. How large a tool did you use to make the hole in the centre?

A. Small hand turning tools.

89 Q. Sketch the size and shape of these carbons as finished by you as near as you can remember?



A. That is about as near as I can get at it.

90 Q. What kind of carbon were these circles made of?

370 A. They were made of retort carbon.

91 Q. What was done with these circles?

A. I don't remember what was really done with it, one was put in a lamp and the other two,—or rather there was one-half a one put in a lamp. The other two I don't know what became of them.

92 Q. What do you mean by one-half of the circle being put in a lamp?

A. They were cut in two so as to form a half circle between the two holders.

93 Q. What kind of a lamp did you see this half circle put into?

A. It was into a long tube-shape- lamp, the same as the majority of the lamps made there.

94 Q. What kind of holders were used for the half circle?

A. I think it was clamped carbon-holders.

95 Q. What were the clamps made of?

A. Retort carbon.

96 Q. How were they held in place?

A. By means of two platinum screws and nuts.

97 Q. Who made these platinum screws and nuts?

A. I did.

98 Q. Who made the lamp or lamps in which these half circles were used?

A. I think likely I must have made them.

99 Q. Were the holders for the half circle arranged differently

or the same as the holders for the straight pencils you have mentioned?

Objected to as bad in form, instructive to the witness and leading.

A. The holders to the half circles was flat clamped together with two platinum screws and nuts.

100 Q. How did this arrangement compare with the arrangement for holding the straight carbon pencils?

A. Well, in the circle carbon we had two upright clamps for the straight carbons; there was one upright round carbon and one horizontal.

371 101 Q. Could you use the half circles with the holders for the straight pencils?

A. Not very well.

102 Q. How many lamps, if any, did you see with the holders arranged for half circles?

A. Not more than one distinctly.

103 Q. Which one was that?

A. I cannot say, with the exception of that one we have just been speaking of.

104 Q. Which one do you mean?

A. The one with the upright clamps, the flat clamps.

105 Q. Did you ever see any other circles or half circles of carbon or curved or circular pieces of carbon besides the circles you have just said you made yourself?

A. No, sir; I can't remember that I have seen any.

106 Q. Did you ever see any one working on circles or half circles of any material besides yourself?

A. No, sir.

107 Q. Nor any curve or circular carbon of any kind?

A. No, sir.

108 Q. Did you ever see any of the lamps with the holders arranged for straight pencils altered over or changed in any way for circular or bent carbons?

A. No, sir; I don't know that I have.

109 Q. How near you did Mr. Sawyer, Senior, work?

A. About four or five feet—let me see—it is more than that. It was near the length of the bench.

110 Q. Was there any partition between you?

A. No, sir.

111 Q. Was his work hidden in any way?

A. No, sir.

112 Q. How far did you work from where Mr. Myers worked?

A. About three or four feet.

113 Q. Who worked on the lathe when it was used?

A. Me, principally.

114 Q. Who else?

A. I don't know that any one did. I don't remember of any one.

372 115 Q. Was Mr. Myers' work in any way hidden from you?

A. I couldn't say that it was.

116 Q. Did you ever work on the same jobs with him?

A. Well, when we was ready to seal the lamps, I used to clamp most of them together.

117 Q. What would Mr. Myers do?

A. He used to expel all the air he could get out of the glass before charging them with gas—nitrogen gas, I believe it was.

118 Q. Was there any partition of any kind in the workshop preventing one workman from seeing the work of the others?

A. No, sir.

119 Q. Did you see any attempt made to hide the work of one man from the others?

A. No, sir.

120 Q. Did you see Mr. Man at any time in the workshops?

A. Yes, sir, frequently.

121 Q. What did he do?

A. He used to come round to see whether the work was going on all right.

122 Q. How often was he there that you know of?

A. Generally every day.

123 Q. Did you ever see him doing any work?

A. Well, no work in particular. He might give some suggestions and help us to work it out.

124 Q. What do you mean by suggestions?

A. Suggest some way of making the parts for the lamps.

125 Q. Do you mean suggestions as to doing your work on the lamps?

A. I mean some suggestions as to how he wanted the work made.

126 Q. What kind of work do you remember Mr. Man giving you suggestions as to?

A. In different forms of the patterns on the parts of the lamps.

373 127 Q. Did you ever see any carbon or charcoal of any kind other than the retort carbon, and the French carbon you have mentioned at either of the workshops?

A. I have seen them file down a piece of willow charcoal—willow carbon.

128 Q. Do you know where this willow charcoal came from?

A. I bought some myself on Fulton street.

129 Q. Do you remember the shop?

A. I believe it was Reynolds'; I won't be certain, though.

130 Q. What kind of willow charcoal was it?

A. It was in the form of crayons.

131 Q. How large were the crayons?

A. About five-sixteenths of an inch in diameter about six inches long.

132 Q. What kind of store is Reynolds'?

A. Paint and artists' supplies.

133 Q. What did you see done with these charcoal crayons?

A. They were filed down to about the same dimension of the carbon pencils.

134 Q. Do you mean the carbon pencils you made a sketch of?

A. Yes, sir.

135 Q. What was done with them then?

A. There was a deposit of carbon formed over them.

136 Q. Who did this work?

A. Mr. Edward Myers was the one I saw do it.

137 Q. Did you ever see anybody else do it?

A. I don't remember seeing any one else do it.

138 Q. How did they get the deposit on the charcoal?

A. By putting it into a closed glass vessel with the gas into the vessel and electricity.

139 Q. Do you mean that they put the charcoal into the glass vessel?

A. Yes, sir; put the charcoal in between two metal points.

140 Q. How large were the charcoal crayons after the deposit had been formed upon them?

A. I should judge about an eighth of an inch thick.

374 141 Q. What did they do with these pencils next?

A. They worked the charcoal core out of the carbon.

142 Q. How was this done?

A. It was done with a piece of wire or head of a file or something. I don't remember exactly how it was done.

143 Q. How much of the charcoal was left in the pencil?

A. Mr. Myers tried to get it all out.

144 Q. Do you know whether he tried to get it all out?

A. That is the way I understood he was doing—trying to get it all out.

145 Q. Did you ever see any willow charcoal or crayons or any form of charcoal or wood carbon used in any way except in forming these pencils as you have just described?

A. No, sir; I don't remember seeing them used in any other way.

146 Q. Did you ever see any wood carbons or wood charcoal of any kind except these willow crayons which you purchased?

A. No, sir.

147 Q. Did you ever see any one at either of the workshops carbonize any material of any sort?

A. No more than willow charcoal.

148 Q. Did you ever see them try to carbonize willow so as to make into charcoal or carbon?

A. Not that I know of. I don't know what they might be trying in that line.

149 Q. Did you ever see them trying yourself?

A. Trying to make charcoal into carbon?

150 Q. I mean trying to make willow wood into willow charcoal or willow carbon?

A. No: I don't know. They might be trying that; that I wouldn't know anything about.

151 Q. Did you ever see or hear about or work on any carbon made from paper of any kind in either of the workshops?

A. No, sir; I did not.

375 152 Q. While you were at the workshops did you ever see

or work on or see anybody working on or using any carbon of any kind, made from paper of any kind?

A. No, sir.

153 Q. Did you ever hear any one saying that such carbon had been used in any way or tried to be used in any way at either of the workshops?

A. No, sir.

154 Q. When did you first see a piece of paper carbon of any kind?

A. I don't know whether I have seen any particular yet, but I saw them trying it in Ansonia, trying to form carbon out of paper. I guess somewhere about 1880.

155 Q. Whom did you see trying?

A. Mr. William Wallace and Mr. Howell, who was Mr. Wallace's electrician.

156 Q. Was this after or before Mr. Sawyer left Ansonia?

A. Afterwards.

157 Q. State the circumstances under which Mr. Wallace and Mr. Howell came to make or show you the paper carbon so far as known to you?

A. Mr. Wallace came up into the shop and said that he had read an account in the paper of Mr. Edison inventing a carbon of paper by accident, and they were trying an experiment between themselves in the shop.

Answer objected to as immaterial and incompetent.

158 Q. Did you, while you were at either of the shops of Sawyer & Man, see any one making or altering any curved or semicircular or circular carbons of any kind, except the circles of hard carbon you have testified you yourself made?

A. No, sir.

159 Q. Did you ever, during the same time, hear any talk of any kind as to using curved or circular carbons of any kind, other than the circles of hard carbon you have testified to making?

A. No, sir.

376 160 Q. About how many lamps of all kinds did Sawyer or Man have at Walker street, so far as you know?

A. Well, I don't know; they seemed to me to be pretty much all one thing; they were generallly pencil carbons—straight pencils.

161 Q. How many lamps did they have, so far as you know?

A. I don't know that I have ever seen more than about a dozen at a time.

162 Q. Do you know any time when they had more than a dozen?

A. No, sir; I do not.

163 Q. What did they do to these dozen or so lamps?

A. That I don't know. They used to have exhibitions once in awhile.

164 Q. Did you ever know of their selling any?

A. No, sir.

165 Q. Did you ever see the lamps burning?

A. Yes, sir.

166 Q. Where were they kept burning?

A. Usually in the office.

167 Q. Where else?

A. We had one one time in the shop, trying to work by it.

168 Q. Did you succeed in working by it?

A. No; it was rather too far away from us to see to work good.

169 Q. How long did that lamp burn?

A. Well, I couldn't say how long that lamp burned. It was burned several times, that lamp; it didn't burn any length of time each time.

170 Q. What is the longest you knew it to burn at one time?

A. Not more than twenty minutes to half an hour.

171 Q. What was done to it then?

A. That I couldn't say.

172 Q. What was the longest you remember to have seen any lamp burn at one time?

A. I don't think I ever saw one burn over half an hour.

377 173 Q. What, so far as you remember, was the general life of a lamp carbon burning in a lamp?

A. As far as my knowledge leads me I don't think they last more than half an hour.

174 Q. What, if anything, was done to the lamps then?

A. They would be taken apart, cleaned and set up again with new carbons.

175 Q. Did you ever work at doing this?

A. Yes, sir.

176 Q. How frequently?

A. Well, I don't know; pretty nearly every time they burnt out.

177 Q. Did you ever see any willow twigs of any description in either workshop?

A. Yes, sir; I saw them in Walker street.

178 Q. What kind of twigs were they?

A. Green willow twigs, three or four feet long.

179 Q. Where did you see them?

A. I saw them in the workshop.

180 Q. Whereabouts?

A. I think they lay in the corner near where I worked.

181 Q. What became of these twigs, so far as you know?

A. I don't know what did become of them.

182 Q. How long did you see them lying round as you have mentioned?

A. I suppose about a month or two.

183 Q. Did you see more than one lot of these twigs?

A. No, sir.

184 Q. Did you ever do any work or see any one do any work on these twigs of any description?

A. Not that I remember.

185 Q. Did you ever see any one at Walker street put anything into the boiler furnace except the coal?

A. Yes, sir; I have seen them with small crucibles with graphite or something in.

186 Q. Do you know what was in these crucibles?

A. No, sir; I do not, further than graphite.

378 187 Q. How often did you see any crucibles put in the furnace?

A. Not more than three or four times, to my knowledge.

188 Q. Did you ever see any crucibles except those you saw put under the boiler furnace at Walker street around the shop or rooms?

A. No, sir.

189 Q. Did you ever know of any of the contents of any of these crucibles being used in any of the lamps?

A. No, sir; I did not.

190 Q. Did you ever do any work on any material which you knew or were told came out of these crucibles?

A. No, sir.

191 Q. Did you ever see any one work on any of the material which came out or which you were told came out of these crucibles?

A. No, sir.

192 Q. Did you ever see anything besides this which, to your best recollection, is in any way possibly connected with manufacturing carbons of any kind at Sawyer & Man's?

A. No, sir.

Counsel for complainant requests examiner to note that Mr. Lowrey was again present at a portion of the afternoon session.

Adjourned to Friday, March 1st, at 11 a. m.

FRIDAY, *March 1st*, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer, Esq., and Walter K. Griffin, Esq., for defendants, and Thomas B. Kerr, Esq., and Amos Broadnax, Esq., for complainant, and Mr. Albon Man, and the examination of Mr. SHARP was continued as follows:

379 R. N. Dyer and Walter K. Griffin, Esqs., as counsel for the defendants in the suit in the southern district of New York, between the complainant herein and the Edison Electric Light Co. and Thomas A. Edison, request of record that the testimony taken for defendant in this present suit may be used by defendants in the New York suit upon the filing of copies certified by the special examiner herein and as heretofore stipulated in regard to the deposition of J. M. D. Keating, for the purpose of saving the retaking of such testimony, and further request the counsel for complainant present for an answer of record to such request.

193 Q. Do you know for what purpose the crucibles were used?

A. No, sir; I don't know really what they was used for.

194 Q. Was Mr. Myers at work with Sawyer & Man when you first went to Walker street?

A. That I can't say for certain whether he was there when I went there or not.

195 Q. How many men were employed in Sawyer & Man's at Walker street? Name them.

A. Mr. Wm. Sawyer, George Sawyer, myself and Mr. Myers.

196 Q. How many men were employed at Howard street? Name them.

A. Two—William Sawyer and myself.

197 Q. Did you see George Sawyer at Howard street?

A. I don't remember distinctly whether I saw him there or not.

198 Q. Did William E. Sawyer work at Walker street? If so, what did you see him do?

A. Saw him treating carbons, making drawings and writing.

199 Q. Did he work at the bench?

A. I don't remember seeing him.

200 Q. Do you remember seeing him do any work at Howard street?

A. No, sir.

380 201 Q. When you were at Ansonia with William E. Sawyer what class of work was done there?

A. The class of work done in Ansonia was feeder lamps.

202 Q. What kind of a lamp was the feeder lamp?

A. The feeder lamp was a lamp with a long pencil made by reversing the current to feed the lamp into contact in case it burnt out or got broke away in any way.

203 Q. How long would a feeder lamp burn?

A. I don't remember seeing it ever burn more than half an hour.

204 Q. What kind of carbon was used in the feeder lamp?

A. A long, thin, hard carbon.

205 Q. Was it the same or different from the carbon used in the lamps at Sawyer & Man's?

A. As far as I knew it was the same kind.

206 Q. Outside of the carbon, please describe generally the lamps used by Sawyer & Man.

A. The lamps generally were a disc of metal with two upright posts. I don't know how to explain that. There was one with a kind of a bend, an L. The carbons were clamped between these two posts. The whole thing was supported by a zigzag strip of metal. This was all encased in a glass tube.

207 Q. Were the zigzag strips of metal all of the same shape in the different lamps?

A. They were, as a general thing.

208 Q. I show you a copy of the specifications of letters patent 205,144 to W. E. Sawyer and A. Man, dated June 18th, 1878, and ask you to look at the figure 1 in the drawings and state how that compares with the general style of lamp used by Sawyer & Man.

A. I remember that lamp, but I think that is the lamp that was made before the one I speak of, yet I could not say for certain whether it was one made before or after the ones I speak of. I remember having tubes in the latter ones to charge them with.

381 209 Q. I ask you to look at figure 49, on page 83 of a book marked for identification "Sawyer's Book on Electric Lighting," March 1st, 1889, and to state whether you saw any lamp at Sawyer & Man's resembling such figure.

A. Yes, sir.

210 Q. When?

A. I think, when I come to think of it, that that was the lamp that was made before the feeder lamp.

211 Q. Was this early or late in the time you were at Walker street?

A. It was late.

212 Q. Please look at figure 50, on page 85 of the same book, and state whether you recognize that figure.

A. Yes, sir; that is the general lamp that I spoke of.

213 Q. Please look at figure 51, on the same page of the same book, and state whether you recognize that figure.

A. Yes, sir; that is the latest one; the other one I am mistaken in.

214 Q. Which one were you mistaken in?

A. I am mistaken in the one 49—the figure 49.

215 Q. What mistake did you make about that figure 49?

A. I haven't any distinct recollection of that lamp. I think it is one that was made before my time.

216 Q. Look at figure 52, on page 87 of the same book, and state whether you recognize that figure.

A. Yes; I recognize that.

217 Q. Where did you see anything resembling that and what was it you saw?

A. That is the lamp I have described as having two upright posts with flat carbon clamps screwed together with platinum screws and nuts.

218 Q. Do you recognize the carbon in that figure?

A. I don't recognize the carbon as being as large as that.

219 Q. Do you mean as large as shown in the figure?

A. As large as shown in the semicircle—the semicircle in the figure.

220 Q. Were the posts or uprights for the carbon as far apart in the actual lamp you saw as in the figure?

382 A. I believe not.

221 Q. How many lamps did you ever see at Sawyer & Man's with the upright posts as shown in or as resembling figure 52?

A. One.

222 Q. Did you ever see any of the lamps resembling figures 49 or 50 or 51 altered over so that the posts in any way resembled figure 52?

A. Well, I can't say whether that one was altered over or whether it was made new.

223 Q. What kind of carbon did you see in the lamp resembling figure 52?

A. I saw retort carbon.

224 Q. How did it compare with the circles or half circles of retort you yourself made?

A. It appears to be about twice the diameter in the figure.

225 Q. What I mean is, was there any difference between the half circles that you made and the circular carbon you actually saw in the one lamp at Sawyer & Man's resembling figure 52?

A. The only difference I see is that the carbons that I turned was an equal thickness all around, an equal breadth.

226 Q. You saw a lamp at Sawyer & Man's with circular carbons you say; were the circular carbons in that lamp the same or different from the half circles of carbon you yourself made?

A. The one I saw there was the one I made.

227 Q. Look at figure 55 on page 89 of the Sawyer book and state whether you recognize that figure?

A. Yes, sir; I do.

228 Q. How do you recognize it, and what does it resemble?

A. By its general appearance.

229 Q. What does figure 55 look like?

A. That is the feeder lamp. I made that all myself—all the parts.

230 Q. Where did you make it?

A. I think I made about two of them in Walker street—Walker and Elm.

383 231 Q. Did you make any more?

A. I don't know that I made any more there.

232 Q. Did you make any more elsewhere?

A. No, sir; but the parts of one hundred.

233 Q. Where did you make these parts of one hundred feeder lamps?

A. At Wallace & Sons, Ansonia, Conn.

234 Q. Was this while Mr. Sawyer was there?

A. Yes; they were started while he was there.

235 Q. You stated that you made two of these lamps at Walker street but only made the parts of the one hundred lamps at Ansonia. What is the difference in your mind between making a lamp and making the parts.

A. I made the lamp and put it together, all but the carbons, I believe, and in Ansonia the metal parts were made by different men.

236 Q. Do you recognize figure 54 in the Sawyer book?

A. That appears to me about the same thing, there is a little difference there. I can't; I don't know whether there is any difference or not. It looks to me as if this feeder tube in the figure was a little different, otherwise I don't see but what it is the same one.

237 Q. The same one as what?

A. 55.

238 Q. Do you recognize figure 53 in the Sawyer book?

A. No, sir; I can't say that I do.

239 Q. You have given the names of the workmen at Sawyer & Man's. Besides these men and besides what Mr. W. E. Sawyer or Mr. Man may have done, did you know of any one making carbons

or doing work on carbons for Sawyer & Man, either at Howard street, or at Walker and Elm?

A. Only Mr. Myers.

Adjourned one hour for luncheon, to resume at 1¾ p. m.

384 Resumed at 1¾ p. m.

240 Q. You have spoken of refilling the lamps at Sawyer & Man's when the carbon burned out: what would you have to do to the lamps before they were ready for relighting?

A. Take them all apart, clean the parts, put new carbons in and sodium we used to put in a little in a piece of rag or cloth.

241 Q. Were the lamps recharged with gas?

A. Yes, sir.

242 Q. How long would this all take for one lamp?

A. About two or two and a half hours.

243 Q. Where was this work done in the office or the workshop, or where?

A. It was done in the workshop.

244 Q. Were there any tools or apparatus in the office for this kind of work?

A. No, sir.

245 Q. Where were all the lamps refilled with gas that you saw refilled?

A. All in the workshop.

246 Q. What part of the shop?

A. On Mr. Myers' bench.

247 Q. Where were the carbons treated?

A. They were treated on the same bench.

248 Q. What different substances have you seen them treat the carbons in?

A. I can't remember now what substances they did treat them in. It was generally oil.

249 Q. Look at figure 41 on page 71 of the Sawyer book and state how that figure compares with what you remember as to the apparatus used for treating the carbons.

A. I don't remember seeing the apparatus at all.

250 Q. How did they fix the carbons for treating?

A. They used to have two metal rods in the bottom of an old lamp, and place a carbon in one end, the upper end of it, and place the electric wires on the other and immerse the carbon end in the oil. That is about all, I believe. They used electricity.

385 251 Q. How often would the lamps be taken apart and refilled?

A. I couldn't say how often—just as soon as they would be burned out or used up.

252 Q. Did you see this refilling done frequently or seldom?

A. I used to see it about every time.

253 Q. Who used to take the lamps apart and refill and refit them?

A. Mr. Sawyer and myself used to take them apart and refit them.

Mr. Edward Myers used to do the filling. Sometimes it was done outside at Mr. Stillman's down in Broadway.

254 Q. Do you mean the refilling or the refitting?

A. Refilling.

255 Q. When a lamp was completed was it kept in the same shape or altered?

A. Well, sometimes altered, sometimes kept in the same shape.

256 Q. What alterations were they making?

A. I don't know. They might make some little difference in the shape of the carbon-holders, or some little thing of that kind.

257 Q. How often would such little alterations be made in the lamps?

A. They would be making them pretty much all the time.

258 Q. How many years have you been a mechanic, and what trade did you learn?

A. I have been working as journeyman mechanic about thirty to thirty-five years. I learned the trade of general brass-finisher.

259 Q. Did you ever know of a lamp at Sawyer & Man's which you were told by any one or which, in your judgment, was a satisfactory lamp as an electric lamp?

Objected to as incompetent.

A. Well, I can't tell exactly whether any one has told me that they had such a lamp, but I never considered that there was one.

386 260 Q. What did you consider the lamps?

Same objection.

A. I didn't consider the lamps anything more than an experiment.

261 Q. You mentioned making the parts of a hundred lamps at Wallace's. How many of these were put together, so far as you knew?

A. Well, not more than ten or twenty, at the very outside.

262 Q. What became of the lamps, so far as you know?

A. The last I saw of the lamps they were cleaning out the room and fired the lamps all out in the yard.

263 Q. Who fired them out?

A. William Wallace, Junior, I believe.

264 Q. Have you ever testified as a witness before?

A. I testified a little for a man in Brooklyn about building a house.

265 Q. Is that your only experience as a witness?

A. No, sir; that's all.

Cross-examination by Mr. Kerr:

266 X Q. How long have you been acquainted with Mr. Albon Man?

A. I should think about fifteen or sixteen years.

267 X Q. Have you known him intimately?

A. Only through business.

268 X Q. Do you believe him to be a man of truth and veracity?

Objected to as irrelevant and immaterial.

A. I do, so far as I have known him and heard of him.

269 X Q. Do you think that Mr. Man would, when testifying under oath, testify to a falsehood?

Same objection.

387 A. I should not think he would.

270 X Q. If Mr. Man should make a statement to you in regard to something which he said he did or had seen, would you believe him?

Same objection.

A. Of course I suppose I should have to if I did not know any different.

271 X Q. On March 14th, 1881, Albon Man testified in an interference case in the U. S. Patent Office, between Sawyer & Man and Thomas A. Edison, as follows:

"Early in the month of October, 1878, we prepared paper carbons in the manner I have described, by carbonization, in the furnace at the corner of Elm and Walker streets, in this city, and perfected them substantially as I have described, and used them during the month of October and the following month until the latter part of March, 1879, in electric lamps at that place, successfully, and exhibited them to great numbers of people."

Do you believe that Mr. Man was swearing to a falsehood when he gave that testimony?

Objected to as incompetent, immaterial and irrelevant and improper, especially because Mr. Man has not testified in this present suit, and because complainant's counsel, General Duncan, in open court, at Pittsburgh, made the statement to the effect that one of the objects of the form of the bill of complaint herein was to avoid the necessity of putting Albon Man on the stand on direct, and as an improper attempt to introduce alleged testimony in this suit.

A. Well, I can't say anything about that, but I can say that I have never seen or heard anything of paper carbons until a year or two after April—May—a year or two after May, 1879.

272 X Q. That is no answer to my question. Please answer my question?

388 A. That is a question I would not like to answer. I have not had sufficient dealings with Mr. Man to know for certain what he would do.

273 X Q. The question has nothing to do with your knowledge. I want you to say whether or not you believe that Mr. Man, when he gave that testimony, was swearing to a falsehood?

Same objection.

A. I tell you I don't know. I couldn't say for certain. The thing is I haven't seen it. I haven't seen it in use nor heard of it.

274 X Q. My question has nothing to do with your seeing or hearing of it. I want you to tell me whether you believe that Alben Man was swearing to a falsehood when he gave that testimony?

Same objection and as especially incompetent in view of the witness' answer.

A. That is something I don't care to answer.
275 X Q. I insist on an answer.

Same objection, and further because complainant has no right to cross-examine the witness except as to facts and circumstances connected with the examination on direct. Defendant's counsel instructs the witness not to answer the question.

A. Under advice of counsel I so refuse.
276 X Q. When you came here to give your testimony, did you know about the testimony of Mr. Man as to the manufacture and use of lamps with paper carbons at Walker and Elm streets?

Objected to as immaterial and irrelevant and because there is no testimony of Mr. Man in this case, and for the further reasons stated to cross-questions 271 to 275, inclusive.

A. No, sir.
389 277 X Q. Were you told that he had testified to any such facts?

Same objections.

A. No, sir.
278 X Q. How did you happen to come here to testify?
A. I was hunted up and brought here or invited here.
279 X Q. Well, which?
A. Invited.
280 X Q. Who by?
A. By Mr. Russell.
281 X Q. Who is he?
A. Mr. Russell is a gentleman I see around here. I don't know any more than that. He must be a kind of an agent.
282 X Q. Around where?
A. Around this office.
283 X Q. When did Mr. Russell first see you about testifying?
A. About two years and a half ago.
284 X Q. Can you fix that date exactly?
A. No, sir.
285 X Q. Why not?
A. Because I don't know it.
286 X Q. Where did you see Mr. Russell first?
A. In the office of the Ansonia Brass and Copper Company, Ansonia, Conn.
287 X Q. Were you working there?
A. No, sir.
288 X Q. How did he happen to find you there?

A. By inquiry, I suppose. I don't know how he found me there.

289 X Q. Did he tell you who gave him your address?

A. I can't say for certain, but I believe he said that George Sawyer told him I was working at Wallace's.

290 X Q. Well, what did he say to you when he saw you?

A. That I can't tell you now, it is too long ago. He told
390 me that Mr. Tomlinson would like to see me, something on
my old—well, I can't tell now what he did say, really. He
wished me to come down and see Mr. Tomlinson.

291 X Q. Didn't he ask you anything about what you would testify to?

A. He asked me if I would testify about the lamps and what I was working on—that is after I got down to the office here.

292 X Q. Did you come down with Russell from Ansonia to New York?

A. No, sir; I did not.

293 X Q. When did you come down?

A. I came down the next morning.

294 X Q. According to your agreement with Russell?

A. Yes, sir.

295 X Q. Did Russell give you any money?

A. He gave me enough to pay my expenses down.

296 X Q. How long were you in New York at that time?

A. I don't know whether I went back the same night or the morning following. It might have been the next night.

297 X Q. Where were you working at Ansonia?

A. At the Electrical Supply Co.

298 X Q. Is that company still in operation?

A. For anything that I know, it is.

299 X Q. Did it have a time book showing the time of the men?

A. I don't know whether it had a time book or not. It had a time list.

300 X Q. Would your absence that day be shown by that time time list?

A. I think very likely it would. It would on Saturday, I know—or Thursday, rather—pay day.

301 X Q. Were you absent often from work?

A. No, sir; very seldom.

302 X Q. Fix the month and year, if you can, when you came to New York at that time.

A. I can't do it very well. It might be somewhere in June, about 1878, I think so; 1887 I meant to say.

303 X Q. Do you think it was that time?

391 A. I think it was somewhere about that time.

304 X Q. That would be less than two years ago?

A. Then that can't be the time; it was about two years and a half ago.

305 X Q. Why do you think it was two years and a half ago?

A. Because it was about a year and a half before I left Ansonia, and I have been in New York a little over a year.

306 X Q. When you came to New York on that trip whom did you see?

A. I saw Mr. Russell. He introduced me to Mr. Tomlinson.

307 X Q. Where did you see Russell?

A. Right out here on the landing. In this hallway here.

308 X Q. Did you at any time make any statement or affidavit?

A. I made a statement.

309 X Q. Was it taken down in writing, and if so, by whom?

A. It was taken in shorthand writing by some stenographer.

Defendant's counsel offers said statement for the inspection and use of complainant as they may deem proper.

Same placed on the table in front of counsel for complainant by counsel for defendant.

310 X Q. To whom did you make the statement?

A. Mr. Tomlinson.

311 X Q. Was it read to you after you had made it?

A. Yes, sir.

312 X Q. How long did you wait for it to be written out?

A. I couldn't say how long it was, perhaps half an hour or an hour.

313 X Q. Did you read it yourself?

A. No, sir.

314 X Q. When was it read to you?

392 A. It was read to me as soon as it was written, as near as I can remember.

315 X Q. When did you next hear of that statement?

A. About two or three hours afterwards, after it was put in printed form.

316 X Q. How did you hear about it then?

A. The stenographer brought it back here and read it over again.

317 X Q. Did you sign it?

A. That I can't say now—whether I did or not. I think likely I did.

318 X Q. Was it dated?

A. I suppose so.

319 X Q. Did you receive a copy of it?

A. No, sir; no further than to see it brought back in the office and read over.

320 X Q. When did you next hear of that statement?

A. I didn't hear anything more of it since then.

321 X Q. Did you swear to that statement when you made it?

A. I don't remember now whether I did or not.

322 X Q. Did you swear to the copy of it after it was typewritten?

A. That is a rather funny thing for me to swear to.

323 X Q. What was funny about it, wasn't it true?

A. Well, if it was read over to me I might possibly swear to it, but to look at it I couldn't tell anything about it.

324 X Q. Have you within the last few days had a paper read to you and been told that that paper was a statement made by you when you were here the first time?

A. No, sir.

325 X Q. Has such a paper been shown to you?

A. That is about the first time I have seen it, I believe.

Witness points to paper on the table.

326 X Q. Do you mean to say that you have not seen that paper during the last week?

A. Yes, sir.

393 327 X Q. Has any reference been made to a statement which you formerly made?

A. I don't remember of any.

328 X Q. When were you requested to come here and testify?

A. This time or the time before?

329 X Q. At this hearing.

A. Tuesday of this week, I believe.

330 X Q. Who requested you to come?

A. Mr. Russell.

331 X Q. When did you come?

A. Wednesday morning.

332 X Q. Did Russell talk to you on Tuesday about your testimony?

A. Not as far as telling me anything about what was in it.

333 X Q. In what?

A. In my testimony.

334 X Q. What testimony do you refer to, the statement made two years and a half ago?

A. Yes, sir.

335 X Q. Did Russell have a copy of that statement you made two years and a half ago along with him?

A. I don't know what he had with him. I didn't see any. I don't know that it was mentioned in any way.

336 X Q. Was it mentioned on Wednesday?

A. I don't remember of its being mentioned.

337 X Q. Did you see it on Wednesday?

A. I don't believe I did.

338 X Q. Was any statement made to you on Wednesday as to what it contained?

A. No, sir.

339 X Q. Did you see it on Thursday?

A. No, sir.

340 X Q. Were you told what was in it on Thursday?

A. No, sir.

341 X Q. Did you see a copy of it on Thursday?

A. No, sir.

394 342 X Q. Do you mean to be understood that never since the time that you made the statement to Mr. Tomlinson two and a half years ago until the present, you have not seen or heard of that statement or had any information as to its contents to the present time?

A. I mean to say that I haven't seen or heard anything about it.

343 X Q. Then you can't say that the paper which was placed on

this table by counsel is the statement you made two years and a half ago, can you?

A. I can't. I haven't seen the inside of it yet. I can't tell anything about it.

At this point counsel for complainant take the paper and retire from the examination-room.

Counsel return.

344 X Q. Please read the paper which counsel placed on the table, and state whether that is the statement made by you to Mr. Tomlinson, about which you have been testifying, and whether it was signed and sworn to by you, and if so, upon what date.

Paper handed to witness.

A. I am pretty satisfied that that is the statement. It was signed on the day I came down here. I can't make out what the figures are. It looks like the 12th day of June, 1886. Well, I can't say really as to swearing, except as it is here.

Defendant's counsel (Mr. Kerr and Mr. Broadnax being present) read and repeat the request already of record as to the books and papers of the Electro-Dynamic Light Co.

Complainant's counsel suggests that no foundation has been laid for any such request or any reasons stated, nor the materiality of said books and papers shown in any way, nor does the request seem to have reason about it that commends it to plaintiff's counsel. Complainant's counsel further suggest that this is not a drag-net investigation, and that there is a proper and legal way which
395 defendant can adopt to obtain anything that it is entitled to obtain. Furthermore, complainant's counsel state that they have not got such books and papers in their possession and don't know where they are.

Complainant's counsel also asks examiner to note that G. P. Lowrey, Esq., was present, for a part of the time during the morning session.

Adjourned till Saturday, the 2d inst., at 10½ a. m.

NEW YORK, *March* 2, 1889.

Met pursuant to adjournment.

Present: Mr. Dyer for defendant and Mr. Broadnax for complainant, and the examination proceeded. (Also present, Mr. Man.)

Cross-questions by Mr. BROADNAX:

345 X Q. Please to make a pen-and-ink sketch of the first lamp you made for Sawyer & Man, or for either of them.

A. I don't know that I can just get on to the first one I had to do with.

346 X Q. Make it as nearly as you can recollect.

Witness makes a sketch and produces the same.

A. That is as near as I can remember it.

347 X Q. Referring now to the sketch made and produced by you, what does the part marked A represent?

A. The glass globe.

348 X Q. What does the part B represent?

A. That represents an upright to hold the top piece E.

349 X Q. You mean one end of the top piece E?

A. I am not sure whether that piece rested on one end or the centre.

396 350 X Q. I do not understand your last answer. Please to state what you mean?

A. What I mean is that I don't know whether this top piece E was pivoted at the center of the top piece or the left end of the top piece.

351 X Q. What does the part D represent?

A. D represents a wire drawing E. to bind carbon F on upwright post C.

352 X Q. What does the part C represent?

A. I should call that the upright C, holder for the carbon.

353 X Q. What does the part I represent?

A. The part I represents the bottom part of the globe.

354 X Q. What do the parts H H represent?

A. The parts H H represent coming through two holes in the bottom of the glass to hold up the upright.

355 X Q. Do you mean that the parts H H represent the bottom ends of the upright B and C where they passed through the bottom of the lamp and where they are sealed therein?

A. Yes, sir.

356 X Q. Was the bottom of the lamp made of glass?

A. A and I are all one continuous piece of glass.

357 X Q. Then the bottom of the lamp was not made of a separate disc of glass as I understand you?

A. No, sir; it was all one piece.

358 X Q. Now were the uprights B and C tubular, I mean were they made of small tubes?

A. I can't say really what they were made—whether of tubes, strips of metal or what. They were metal.

359 X Q. Was the upper end of the part B made wedge-shaped as you have shown?

A. I think it was.

360 X Q. What does the part F represent?

A. The part F represents the pencil of carbon.

361 X Q. And the part E what does that represent?

A. The part E represents a piece of metal bearing on one end of the carbon and pressing the carbon on the upright C.

397 362 X Q. And the other end of the part E as I understand you bears upon the top of the part B?

A. Yes, sir.

363 X Q. The part E is held down on the parts F and B by the part D?

A. Yes, sir.

364 X Q. Now did the lower end of the part D pass through the bottom of the lamp, about midway between B and C?

A. That I can't remember about. The wire came through somewhere, but where I don't recollect; somewhere on the bottom.

365 X Q. By the wire you mean the part D?

A. Yes, sir.

366 X Q. Now, wasn't the part D secured to the loop at its lower end, which was fastened to the inside of the bottom of the lamp?

A. I couldn't say. I don't remember it.

367 X Q. Did the whole or any part of the part D consist of a small spiral spring?

A. I couldn't remember, but it seems to me there was a small spiral spring attached to it.

368 X Q. There must have been some way of drawing or holding the part E down upon the upper ends of E and B. Can't you call to mind how that was done?

A. No, sir; I cannot.

369 X Q. Were the lower ends of the parts B and C sealed in the bottom of the lamp?

A. They were.

370 X Q. How were they sealed?

A. Those bottom pieces H H were turned with a flange partly conical shape under the flange, the lower part straight with a thread. They are cut in two halves, slipped inside of the glass, with a paper washer, I believe. The two halves were drawn through the paper as a washer, then through the glass, another paper washer on the outside of the glass, and screwed down with a nut.

398 371 X Q. Please make a sketch of the arrangement you have described in your last answer?

Witness makes and produces a sketch.

A. I have done so.

372 X Q. Is this sketch marked figure 2 which you have just produced the best you can recollect of the method of fixing and sealing the lower ends of the parts B and C in the bottom of the lamp?

A. Yes, sir.

373 X Q. And in this sketch, figure 2, as I understand it, there is a vertical section of a conical tubular end shown, into which or to which the parts B and C are connected; the nut M shown in figure 2 being screwed on the lower end of the part K, the part K being made in two parts joining in the centre vertically. Is that the way it was?

A. That is as near as I can think of it.

374 X Q. Now, can you recollect how the lower ends of the parts B and C were connected to the parts K K?

A. No; I can't remember just how it was done.

375 X Q. Did the parts K K, when they were put together, form a tube or hole through the centre?

A. I don't know whether it formed a hole or not, but I know that it clamped the two uprights.

376 X Q. Now, how was the carbon F fixed in the upper end of the part C?

A. I don't remember whether there was a countersink in the top of upright C or what there was.

377 X Q. In short, you don't recollect how part F and part C were united, as I understand you?

A. All I remember is that there were put in between these two points and held down by the wire or spring D.

378 X Q. What were the uprights B and C made of?

A. That I can't tell; there was a piece of metal, but what the form of the metal was is more than I can tell.

379 X Q. What was the part F made of: was that made of metal also?

A. The part F is supposed to be made of carbon.

399 380 X Q. Do you distinctly recollect that that part was made of carbon?

A. No, sir; I do not.

381 X Q. Did you understand this lamp to be an incandescent electric lamp?

A. No, sir; I didn't know anything at all about it, what it was.

382 X Q. Who told you to make it?

A. Mr. Man and myself made it together, or rather I worked according to Mr. Man's dictation.

383 X Q. Did you make this lamp at your house?

A. Yes, sir.

384 X Q. What did you understand it to be for when you made it?

A. I didn't know anything at all about it. Mr. Man got me to make such parts as he wanted, and I made them as directed.

385 X Q. Did you see it after it was finished?

A. Mr. Man and I put the parts through into the lamp; made the connections in the bottom; whether we put a carbon in or not, I can't say for certain. Then Mr. Man took it away with him, and that was the last I heard of it.

386 X Q. Did not Mr. Man tell you what it was for?

A. He did not.

387 X Q. Then, as I understand you, you made this lamp without having any idea what it was for?

A. Yes, sir.

388 X Q. Did you subsequently ascertain what it was for?

A. I don't believe—I don't know that I ever saw or heard anything of it afterwards.

389 X Q. Who made the holes in the bottom of the lamp into which the uprights are set or secured?

A. Those was made in the glass when I got it?

390 X Q. Did you not drill these holes yourself with a steel drill?

A. If I am not very much mistaken they were punched out in the glass-house wherever the glass was made.

391 X Q. Do you mean to answer my question in the negative?

400 A. I don't remember of doing so.

392 X Q. As I understand, you cannot swear that you did

nor can you swear that you did not drill these holes in the bottom of this lamp. Is that correct?

A. I cannot swear either way.

393 X Q. In placing these uprights in the bottom of the lamp, did you use cement or any other material for the purpose of making an air-tight joint between the uprights and the glass bottom?

A. I don't remember making anything more than paper washers. If I remember right, my thought was to keep from breaking the glass.

394 X Q. Did Mr. Man tell you that he wanted those uprights made with an air tight joint between them and the glass?

A. Not that I can remember.

395 X Q. Do you remember of drilling holes in a lot of glass discs which were to form the bottom of incandescent electric lamps at your house?

A. I remember drilling holes in such things. Whether I drilled any of them at my house or not I don't remember. I believe I drilled some corner of Walker and Elm streets.

396 X Q. How did you drill those holes?

A. As near as I can remember, I drilled them with a hand drill and turpentine.

397 X Q. What was the drill made of?

A. Steel, with a very hard point.

398 X Q. Now this, as I understand you, is the first lamp that you made at your house for Mr. Man?

A. According to my recollection I believe that was the first one.

399 X Q. Did Mr. Sawyer see you at all in connection with this lamp, in connection with the making of this lamp I mean?

A. No, sir; he did not.

400 X Q. Did you make two lamps at your house for Mr. Man?

A. I believe I made one more after that.

401 X Q. Please to make a pen-and-ink sketch of the second lamp made by you for Mr. New at your house.

401 A. I can form very little idea of the second lamp I made, any further than it was in tubular form.

402 X Q. Please to illustrate it in a sketch as far as you recollect it.

Witness makes and produces a sketch as requested.

403 X Q. Referring to the sketch you have just made what is represented by the part A of that sketch?

A. The part A is a glass tube with a flange at B.

404 X Q. The part C, what does that represent?

A. That represents the bottom of the tube A.

405 X Q. In this case as I understand you the enclosing globe of the lamp is represented by A, and that this globe has an open bottom which was closed by a separate disc of glass C. Is that the way it was?

A. I can't remember whether the disc C was made of glass, metal or soapstone.

406 X Q. And yet you say you made the lamp?

A. Yes, sir.

407 X Q. Were there holes in the disc of the lamp that formed the bottom?

A. I believe there were.

408 X Q. Please to put them in your sketch.

A. I do so and letter them D D.

409 X Q. What were these holes for that you have illustrated and marked D D?

A. They were to—I don't know hardly how to explain that—they must be for the holders for the carbon.

410 X Q. Well, they were as a matter of fact holders for the carbon, were they not?

A. So far as I know about lamps now, they must be—they were.

411 X Q. Please to illustrate them on the drawing as nearly as you can—I mean the carbon holders to which you have referred.

A. I can't illustrate them because I can't form any idea what they are.

Adjourned for lunch.

402 Resumed after lunch.

412 X Q. Do you mean that you have so far forgotten the construction of the lamp as to be unable to illustrate its principal parts?

A. I do.

413 X Q. And that you have illustrated it as far as you are able to?

A. Yes, sir.

414 X Q. Now did you see either of the lamps of which you have made sketches in part, illuminated?

A. I did, sir.

415 X Q. I am referring of course to the identical lamps that you made. Did you understand me in that way?

A. Yes, sir.

416 X Q. Which one of the lamps did you see illuminated?

A. Figure No. 3.

417 X Q. Did you put the carbon in that lamp?

A. No, sir; I did not.

418 X Q. Do you know who did?

A. No, sir.

419 X Q. For whom did you make that lamp?

A. For Mr. Man.

420 X Q. Did Mr. Sawyer give you any direction in the construction of that lamp?

A. No, sir.

421 X Q. You made it, as I understand you, wholly under the direction of Mr. Man and delivered it to him?

A. I did, sir.

422 X Q. Where did you see it illuminated?

A. Mr. Sawyer turned it on for me, soon after I went to work at the corner of Centre and Howard streets.

423 X Q. What did Sawyer "turn on"?

A. Turned on the current of electricity.

424 X Q. How long was that after you delivered the lamp to Mr. Man?

A. It might be a month, it might be two months after.

403 425 X Q. How do you know that it was a month or two months?

A. Well, I don't know for a certainty. I am only giving it to you as near as I can think of it.

426 X Q. Can you give the time when you went into the employ of Messrs. Sawyer & Man at their shop or laboratory?

A. No, sir; I cannot. I have no recollection of the dates.

427 X Q. Can you tell about how long it was after you went into the employ of Messrs. Sawyer & Man at their shop before Mr. Sawyer turned the current into the lamp for you?

A. No, sir; I cannot. I can't give it any nearer than I gave it before.

428 X Q. Then, I understand you to say that your best recollection is that it was within one or two months after you delivered the lamp to Mr. Man that you saw that same lamp illuminated?

A. Yes, sir.

429 X Q. Can you recollect when it was that you delivered the lamp to Mr. Man?

A. All that I can say on that is that when the lamp was finished Mr. Man took it away with him. I can't give any date; I can't remember any.

430 X Q. State what year it was, and as near as you can what time in the year.

A. I don't know. I should think it must be somewhere in July of 1878.

431 X Q. You are referring now to the lamp you saw illuminated, as I understand you?

A. I am referring, I believe, to the time I went to work for Sawyer & Man, if I understand it right.

432 X Q. You misunderstand me; I am referring to the time when you delivered the last lamp you made to Mr. Man; give the year and the month in the year when that occurred?

A. I think it must have been somewhere about May or June of 1878.

433 X Q. Is that as near as you can give the date?

A. It is.

404 434 X Q. How do you know that the lamp Mr. Sawyer turned the current on for you as you have testified was the identical lamp you made for Mr. Man?

A. Mr. Sawyer told me that that was the lamp and the best lamp of any they had had. That is the first lamp that I know of being a lamp. I did not know that it was a lamp till I went to get my pay for it from Mr. Man. Then he called my attention to it and said it was a very good lamp and he thought that I might like to know what I had been working on.

435 X Q. Was that before or after you had seen it illuminated?

A. It was before I saw it illuminated and within a few days after I delivered it to Mr. Man.

436 X Q. When you say "lamp" in your previous answer you mean an incandescent electric lamp, do you?

A. I do, sir.

437 X Q. When you saw this lamp illuminated by Mr. Sawyer, were you able to identify it as the lamp you had made, irrespective of anything Mr. Sawyer told you?

A. Well, I can't remember now; I believe I made a surprise at the time and told Mr. Sawyer I wouldn't have known it.

438 X Q. How long did you see the lamp illuminated?

A. A few seconds.

439 X Q. When you say you saw it illuminated "a few seconds" do you mean that Mr. Sawyer then turned the current off from the lamp, or do you mean that the lamp went out on account of the disruption of some of its parts?

A. Mr. Sawyer turned the current off.

440 X Q. At that time did you understand the principle or mode ot operation of these lamps?

A. I did not.

441 X Q. Do you understand the principle or mode of operation of the lamps now?

A. I don't understand very much about it any further than one pole has got to be insulated from the other.

407 442 X Q. Is that all you know about it?

A. Perhaps I have stated that wrong; I ought to have said I believe that one pole should be insulated from any metallic parts of the works of the lamp, so that the two poles may work through.

443 X Q. After you made the first lamp shown by your pen-and-ink sketch, figures 1 and 2, how long was it before you made the other one shown by figure 3?

A. I don't know; I suppose it would be, perhaps, a couple of weeks.

444 X Q. Is that all the lamps you made for Mr. Man at your house?

A. That is all.

The two pen-and-ink sketches made and produced by the witness, marked as figures 1, 2, and 3, are offered in evidence as Complainants' Exhibits Sharp's Drawings, said exhibits being offered as part of the cross-examination of the witness Sharp, and the same are marked Complainants' Exhibits Sharp's Drawings, figures 1, 2, and 3, March 2d, 1889.

(Here follow diagrams marked pp. 405 & 406.)

445 X Q. After you had delivered the lamps, about which you have been testifying, to Mr. Man, what is the next work you did for them or either of them?

A. I can't remember the class of work I did there.

446 X Q. Did where?

A. At Centre and Howard streets.

FIGURE
3.

William Sharp

447 X Q. Was Centre and Howard streets the place where you did the first work for them or either of them after making and delivering the two lamps to Mr. Man about which you have been testifying?

A. It was.

448 X Q. And, as I understand you, you do not recollect what the work was that you first did when you went in their employ at Centre and Howard streets?

A. That is right.

449 X Q. What kind of work were you employed upon for them at Centre and Howard streets?

408 A. As near as I can tell, it was parts of electric lamps. When I first went there I didn't know anything about electricity. I was working with Mr. Sawyer, helping him out at whatever he was doing.

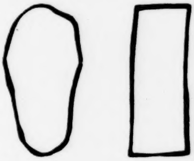
450 X Q. Do you mean Mr. Wm. E. Sawyer?

A. No, I mean Mr. Wm. Sawyer.

451 X Q. What was he doing that you helped him on?

A. The only thing I can distinctly remember is pieces of brass like the sketch which I now make on this sheet.

Witness makes the accompanying sketch.



452 X Q. What are these sketches intended to represent? I mean, what were these pieces of brass for?

A. As far as my knowledge goes, they were parts of some of the lamps they were then making.

453 X Q. Was it not explained to you what parts of the lamp these pieces of brass were intended for?

A. I don't know that it was, I supposed at the time that I was on lamp work.

454 X Q. But really you didn't know whether you were or not?

A. I did not.

455 X Q. How many of these pieces of brass did you make and how long were you to work upon them?

A. I have no recollection.

456 X Q. What else did you work on besides these pieces of brass?

A. That was all I can recollect.

457 X Q. Was this work done in the shop of Arnoux & Hochhausen?

A. It was.

458 X Q. Under the direction of Mr. Wm. Sawyer as I understand you?

A. Yes, sir.

409 459 X Q. How much of your time at Howard and Centre streets was spent at work in the shop of Arnoux & Hochhausen, and how much of your time was spent down-stairs in the room of Mr. Sawyer?

A. My time was all spent in the workshop of Arnoux & Hochhausen with the exception of a few minutes, perhaps two or three times.

460 X Q. Now, when the shop or laboratory of Sawyer & Man was moved from Howard and Centre streets to the corner of Walker and Elm, did you go with them and continue right on in their employ?

A. I did not, not at first.

461 X Q. How long after the removal to the corner of Walker and Elm before you went there to work for Sawyer & Man?

A. When Sawyer & Man moved I went to work for Arnoux & Hochhausen. Then they used to borrow me from Arnoux & Hochhausen about every day or every other day to do some job for them for perhaps two or three weeks. Then they took me to work for them altogether until Sawyer & Man disagreed and broke up the business.

462 X Q. And that was when?

A. I can't give you any dates. I don't remember them.

463 X Q. Now, during the time that Sawyer & Man were borrowing you of Arnoux & Hochhausen how much of your time was spent in the laboratory of Sawyer & Man after their removal to Walker and Elm streets?

A. I don't know. I might, perhaps, have been there one, two or three days in the week.

464 X Q. What work was you engaged upon for them during that time?

A. That I don't remember.

465 X Q. After you left Arnoux & Hochhausen's employ and went into the employment of Sawyer & Man what work were you engaged upon for them. I mean when you first went in their employ there?

410 A. It was work similar to what I have been working on all the way through, experimental work, such as making parts for experimental lamps.

466 X Q. What were the first experiments or parts for experimental lamps that you worked on after going to work in that shop?

A. I couldn't tell you no more than if I had never made them.

Adjourned till Monday, the 4th inst., at 10½ a. m.

MONDAY, *March 4th*, 1889.

Met pursuant to adjournment.

Present: Mr. Griffin for defendants, Mr. Kerr for complainant, and Mr. Albon Man and the cross-examination of Mr. SHARP was continued.

Questions by Mr. KERR:

467 X Q. Did you ever assemble any lamps for Sawyer & Man?

A. Do you mean by "assembling" putting them together?

468 X Q. Yes.

A. Yes, sir.

469 X Q. Those lamps all had a base plate, did they not?

A. Are you referring to No. 3 now?

470 X Q. No, I am not referring to No. 3.

A. All but the first one I made.

471 X Q. And the working parts were all mounted on that base plate, weren't they?

A. Yes, sir.

472 X Q. Then when the lamp was put together the working parts were inserted into the glass globe, and the base plate was clamped to the lower open end of the glass globe?

A. Yes, sir.

473 X Q. How was it clamped?

411 A. They were clamped by two rings, one above the flange of the glass globe, one under the base and clamped together with about six screws, as near as I can think.

474 X Q. When you wanted to take out the working parts what did you do?

A. We had to take the screws out, and take the rings off and take the works all out with the base.

475 X Q. Merely pull them out?

A. Yes, sir.

476 X Q. How long did it take you to undo the six screws?

A. It might take about two or three minutes.

477 X Q. Then how long did it take to pull off the rings and pull the base plate off the lamp?

A. About one minute, I guess.

478 X Q. Wasn't that a long while for that operation?

A. Sometimes it was not.

479 X Q. Why not?

A. Sometimes we would have to warm the bottoms of the lamps to get them apart—soften the cement.

480 X Q. Did you ever have to pry the base plate off?

A. Not very hard.

481 X Q. How long did it take you to wipe out the globe?

A. I don't remember whether I wiped out globes or not. I might have done it sometimes.

482 X Q. Did you ever put in a new carbon in the clamps?

A. That is something I can't distinctly remember.

483 X Q. Did you ever see it done?

A. Yes, I believe I have seen it done.

484 X Q. Where there were screws to clamp the carbons, how long did it take to take out an old one and put in a new one and screw up the clamping screws?

A. That is something I can't give just exactly; I should think on an average it might take a couple of hours.

485 X Q. A couple of hours to unscrew two screws, take out

412 a little piece of carbon less than an inch long from the loose clamps and then put in another piece into the open clamps and screw up two clamping screws again. Do you mean that?

A. In taking down a lamp there was always more or less cleaning to be done and instead of two clamping screws there were six.

486 X Q. Six clamping screws to hold the carbon in the carbon clamps? Do you mean that?

A. No, sir; I mean putting the lamp together, all through.

487 X Q. I didn't say anything about cleaning or putting the lamp together all through. Now please go back to question 485 and answer it.

A. No, sir; that wasn't my general work, putting in the carbons.

488 X Q. That don't answer my question. How long would it take to unscrew the two clamping screws which held the carbon?

A. I don't know whether two clamping screws come in on the carbon.

489 X Q. How was the carbon held?

A. As near as I can think of it, it was done with a small wire and a spiral spring, with a short piece of threaded wire and one nut to regulate it.

490 X Q. How long would it take to take a broken carbon out of that kind of a fastening?

A. They would generally fall out themselves, break and fall out.

491 X Q. Then how long would it take you to put a new carbon back into those fastening devices?

A. Without cleaning it would take about a couple of minutes.

492 X Q. Then after you had the carbon in the clamp and the globe cleaned you put the lamp together by inserting the works inside of the globe, putting on the two clamping rings at the bottom and screwing up the six screws in the clamping rings, did you not?

A. I did.

493 X Q. How long did that take you?

A. Before doing that we had to cement the two glasses
413 with Canada balsam. I had to be very careful not to get the
balsam smeared on the inside and for that reason and being careful not to break the glass by tightening one screw tighter than another it would take fifteen or twenty minutes.

494 X Q. Did you put the balsam on the base plate or on the end of the globe?

A. I suppose I put it on the end of the globe. That would be the most proper place.

495 X Q. You simply touched the end of the globe with a brush dipped in the balsam, did you not?

A. I don't know whether it would be wood or whether it was wire. I had no brush.

496 X Q. How much of the fifteen or twenty minutes did it take you to put the balsam on the end of the globe?

A. It might take two or three minutes to put it on the globe and work it evenly through, leaving no air space.

497 X Q. Then it took you from twelve to seventeen minutes to put in the six screws?

A. That is the figures as near as I can give them to you. I never timed myself on any of the work.

498 X Q. Don't you think that you have given four or five times too much time to that operation of putting in six screws?

A. I don't think I have given any too much time for taking it altogether.

499 X Q. I am not taking it altogether. I am taking the six screws by themselves.

A. I don't think I have given much over the time that it would take.

500 X Q. Isn't it a fact that this work was done by Mr. Myers and not by yourself, as a usual thing?

A. As a usual thing it was done by myself.

501 X Q. How often did you do it altogether?

A. I can't say. I don't remember.

502 X Q. Ten times?

A. Yes.

503 X Q. More than that?

A. Yes, sir.

504 X Q. Twenty times?

414 A. Yes, over fifty times.

505 X Q. How much over fifty times?

A. I don't know. I wouldn't want to go any further than that.

506 X Q. Are you willing to swear that you did it more than fifty times?

A. I have no recollection of the number of times I have taken. I can't swear to a thing that I don't remember perfectly.

507 X Q. What is your impression?

A. I haven't got any.

508 X Q. Then you are not willing to swear that you did it more than fifty times?

A. No, sir.

509 X Q. Did Myers ever change any carbons?

A. I think Myers was the man that generally done it—Mr. Edward Myers.

510 X Q. The only other thing necessary in changing the carbons was to exhaust and fill the lamps, is that so?

A. Yes, sir—well, I don't know—there was sealing after that.

511 X Q. Who did that work of exhausting, filling and sealing?

A. I have seen Edward Sawyer do it, Edward Myers and Thomas Stillman.

512 X Q. Where did they do it?

A. They did it on Mr. Myers' bench.

513 X Q. What kind of apparatus did they have for exhausting the lamp?

A. The first thing I saw was a couple of rubber bags—gas bags. The apparatus they had after that I don't distinctly remember. They put two or three in a line, attached them together with rubber tubes, made the gas in a glass retort and forced it through the lamps.

514 X Q. Where was this apparatus placed?

A. On Mr. Myers' bench in the shop.

515 X Q. Did you see any mercury tube connected with it?

A. There was a glass tube with a bottle of mercury on the 415 bottom of the tube. I don't remember seeing it attached to the lamps.

516 X Q. Was there more than one mercury tube?

A. I don't remember whether there was one or two.

517 X Q. Did you see any other chemical apparatus connected with that exhausting and filling apparatus?

A. I have seen them use melted sodium. I believe that there was bottles of chemicals that the gas run through besides the sodium.

518 X Q. Was this exhaustive and filling apparatus mounted permanently in any place?

A. I can't remember for certain whether it was built permanently in Walker street or not. I know the retort used to be removed every time they got through with it.

519 X Q. What retort?

A. The retort they made the gas in.

520 X Q. When you say that the exhausting and filling apparatus was on Myers' bench do you mean that it was permanently fixed to Myers' bench?

A. I say I don't remember whether it was permanently fixed or not.

521 X Q. How often was it used?

A. That I couldn't say, there was no regular time for using it.

522 X Q. Was it put up every time it was used and then taken down?

A. I have stated that I don't know whether it was permanently or not. I don't remember what kind of an apparatus it was. It was something in form of a rack or shelf. That is all I can tell about it.

523 X Q. Do you remember anything of a screen being used to show the form of the carbon in the lamp?

A. I think I remember seeing a screen one night when they had an exhibition in the office. They had some magnifying glasses. That is about all I remember of it.

524 X Q. Was that the only time you ever saw the screen?

A. That is the only time.

416 525 X Q. How often were you in the front office?

A I don't know. I might perhaps be two or three times a day in it. The screen I saw was after the exhibition was over.

526 X Q. Do you know about any person ever coming to see the lamps. I don't refer to exhibitions they made?

A. I have seen gentlemen around the place looking at them trying how far they could see to read from them.

527 X Q. How often?

A. I don't remember whether I have seen it more than once or not.

528 X Q. Do you wish to be understood as saying that Sawyer & Man never made but one arch-shaped carbon lamp?

A. I don't remember of any other.

529 X Q. Are you willing to swear that they never made any other?

A. I don't remember of any other. I wouldn't swear to it.

530 X Q. Are you willing to swear that they never used a paper carbon lamp?

A. I am willing to swear that I never saw or heard of such a thing till some time after I got through with Sawyer & Man'-work.

531 X Q. Then you are not willing to swear that they never used a paper carbon lamp?

A. I never saw them use one.

532 X Q. That don't answer the question. Please answer it.

A. Or heard of them using such a thing.

533 X Q. That don't answer the question. Please answer it.

A. I am not willing to swear to something I don't know anything about.

534 X Q. Were they in the habit of telling you all they were doing there?

A. They were not in the habit of telling me all that they were doing, but I think if there was anything like that, I would be apt to know something about it.

417 535 X Q. What do you mean by "like that"?

A. The like of paper carbon, or anything of that description.

536 X Q. And yet you didn't know what they were doing in the crucibles you saw?

A. I don't remember—I don't know what they would be doing with the crucibles.

537 X Q. Didn't you ask any questions about operations that were going on there?

A. I have asked lots of questions.

538 X Q. Did Sawyer or Man, or old Mr. Sawyer, answer all your questions?

A. No, sir; I can't say they would answer all.

539 X Q. Didn't they rather snub you?

A. No, sir, they did not.

540 X Q. Don't you know that there was a number of things going on there that you knew nothing about?

A. There was things going on there, when it did not concern me, that was going on anyway secretly—that I wouldn't ask questions.

541 X Q. Wasn't your work principally brass work?

A. Yes, sir. Brass and copper. It was principally copper.

542 X Q. Were all the carbons they used treated in oil, or hydro-carbon gas?

A. Hydro-carbon gas is something I don't know anything about. I don't know what it is, without it is explained to me. The carbons was all, I believe, treated in oils of some kind. I think I have seen it done in naphtha; I am not sure.

543 X Q. After a carbon was treated, could you tell what the original carbon was?

A. I couldn't see that there was much difference after treating, than they were before treating, except they might be a little thicker and a little brighter.

544 X Q. Did you ever have treated carbons to put in lamps, the original carbons of which, before treatment, you never saw?

A. The placing of the carbons in the lamps was not a part of my business.

418 545 X Q. Did you ever see treated carbons, the original carbons of which before treatment you did not see?

A. I couldn't say anything about that.

546 X Q. Do you think it is an easy matter to tell what kind of carbon a treated carbon originally was?

A. I never took that much notice of them.

547 X Q. Please make a plan of the rooms at Walker and Elm streets showing the position of your bench, Mr. Myers', the machinery, office, boiler, boiler-room, water-closet and the whole thing, and any other rooms there were in connection with Sawyer and Man's business?

Adjourned for one hour.

Resumed after luncheon.

A. I have made and produce a sketch, A is Mr. Edward Sawyer's desk, B the lathe, C William Sawyer's vise, D first dynamo, E is my vise, F is Mr. Myers' bench, G second dynamo, H boiler, I the engine and J water-closet.

(Here follows diagram marked p. 419.)

548 X Q. What is the place marked K?

A. The place marked K is an opening, I believe, between the first floor and the roof.

549 X Q. What occupied that space, if anything?

A. On the second floor it was not occupied by anything. It was fenced round, if I can remember.

550 X Q. Wasn't the water-closet J between that space K and the engine?

A. I think not.

551 X Q. Do you remember anything about a pump for exhausting the lamps?

A. I don't know of any particular pump with the exception of the glass tube and the bottle of mercury that I have mentioned before; I don't know of that being as a pump any further than Mr. Man spoke to me about it recently.

552 X Q. How closely were you at your bench E?

A. I was working from the bench to the lathe B principally.

553 X Q. At which were you the greater part of the time?

420 A. I think at the vise.

554 X Q. When working there your back was to the balance of the room, was it not?

A. Back of the bench, this way, I faced the window.

555 X Q. Is the room in which Mr. Sewyer's desk appears what you have referred to as the office?

Sharps diagram of
Walker Street Shop
April 4 1887
W. J. S. E.
N. P.

A. Yes, sir.

556 X Q. Did you know all that usually went on in the office?

A. No, sir.

557 X Q. Do you know how much they burned the lamps in the office?

A. No, sir; I don't know how much.

558 X Q. Do you know that Mr. Wm. E. Sawyer was setting up lamps, putting in carbons, testing carbons and making measurements in the office?

A. No, sir; I don't know as I knew that. I know that there has been lamps put up, some on the wall and some on the chandelier. I have seen him filing carbons. I don't know about setting up and testing them. I may have seen him do such things, but I being working at my vise E, or at the lathe B, could not see much in the office.

559 X Q. How many lamps were on the chandelier?

A. I couldn't say whether there was three or four.

560 X Q. How many lamps were put up around the room, not on the chandelier?

A. I have no distinct recollection of that. I don't know of more than three or four. I know there was one on the office side of the partition, between the office and the workshop. I believe there was one on the front of the building between the windows. There was one I know; whether there was more than one, one or more, on the Elm street side. I don't remember seeing anything on the stairway partition.

561 X Q. Do you remember anything about a hand lamp on Sawyer's table?

A. I have no recollection of a hand lamp on Sawyer's table, but I have seen a picture of it in the "Scientific American."

421 562 X Q. About these chandelier lamps; did they stand upright or were they pointing downward, pendent.

A. To the best of my knowledge they were always standing.

563 X Q. Do you remember any other tables or desks in the office room?

A. No, sir; I don't know that I do.

564 X Q. Did you ever see any testing instruments in the office?

A. I don't know hardly how to answer that question. I believe there has been such a thing in there, or some mention of getting one.

565 X Q. Were there any cupboards in the workshop?

A. No, sir, I believe not I believe there was something—something with a piece of black cloth around Mr. Myers' bench for a time. I know the cloth took fire and burned up. I believe it was a small closet with some kind of chemicals in.

567 X Q. Were there any galvanic batteries in the office room?

A. I never saw any batteries further than the two dynamos.

568 X Q. But they weren't in the front room, were they?

A. No, sir.

569 X Q. Please tell me what money, if any, you have received from Mr. Russell or from anybody in anyway connected with the

Edison Electric Light Company in connection with the matter of the testimony you have supplied or promised to supply them in reference to Sawyer & Man?

A. I received ten dollars last Friday; I was out of pocket money; I asked Mr. Griffin if he could let me have a little change, as I was getting short, and he gave me the ten dollars. I have made no agreement whatever. Mr. Russell gave me ten dollars to come down to New York from Ansonia. I made no arrangements for what testimony I should give. I didn't know when I came down really what I was coming for. I made no arrangements for my testimony or money.

422 570 X Q. How much did you receive when you came to New York the first time?

A. When I got through with the testimony Mr. Tomlinson gave me sixty-five dollars.

571 X Q. What wages were you receiving in Ansonia?

A. Three dollars a day.

572 X Q. Did Mr. Russell tell you that it would be made all right with you if you came to New York and made your statement or anything to that effect?

A. I don't remember that he did.

573 X Q. Did you have any such expectation when you came?

A. I had no such expectations as that. I expected to be paid pretty liberally for my loss of time and trouble.

574 X Q. Had you known Mr. Russell before that time?

A. I don't know that I ever saw him before.

575 X Q. Do you mean that you came to New York at the request of an entire stranger, risking your time and trouble?

A. I mean to say that there was about a half a dozen men came chasing me around at Ansonia, wanting to find out something, I don't know what. Mr. Russell spoke pretty frank to me. He gave me some idea what was wanted. I came down and thought I would give my evidence, as I did not suppose it would amount to anything and as that might put an end to people running after me.

576 X Q. Am I to understand, then, that you came to New York with Mr. Russell, an utter stranger, without any understanding with him?

A. I didn't come down with Mr. Russell, and there was no understanding as to money.

577 X Q. Money is not the only valuable consideration. Was there any understanding as to anything else in the shape of a consideration?

A. No, sir; there was not. My understanding as to coming down with an utter stranger was that I was coming to my old home and to see my own people. If it had been in any other place I wouldn't have come.

423 578 X Q. After you had made your statement did you have any understanding in regard to being called as a witness?

A. No, sir; the only understanding I had, as I told Mr. Tomlinson, was, as I was going out of the office, that I hoped—I can't give it in just the same words—that he would not bother me any more. He told me that he would if it was needed.

579 X Q. After that when did you next see Mr. Russell?

A. I believe it was last Tuesday morning.

580 X Q. What did he say to you?

A. I can't just remember what he said to me then. He spoke to me and asked me if I didn't know him. I told him "Yes." He told me that these people wanted to see me again, that they had made a change and that Mr. Tomlinson was out of Mr. Edison's employ and that there was a man by the name of Dyer in his place. That is about all I remember. He told me that Mr. Dyer wanted to see me,

581 X Q. Did he say to you that it would be all right if you came over?

A. I don't know that he did.

582 X Q. You don't know that he didn't, though?

A. I don't know really particularly what he did say. Of course I expect to have my time and expenses paid.

583 X Q. What else do you expect?

A. I have got no expectation.

584 X Q. You have bought a house lately, haven't you?

A. I have, sir.

585 X Q. Now, referring to the time you were at the Walker and Elm street shop, what other work, if any, was done besides making lamps there?

A. I saw Mr. Sawyer tinkering with a meter or trying to get up a meter to measure an electric current, and there was something done concerning some switch. I believe I made some patterns and they got castings. That is about as much as I remember of them. I done some work at it, but I don't remember what; I don't remember finishing them.

424 Redirect by Mr. GRIFFIN:

586 Re-D. Q. Did you ever see Mr. Broadnax before you met him at this examination?

A. I did, sir.

587 Re-D. Q. How did you come to see him?

A. The first I remember of seeing Mr. Broadnax, he was one of the men, as near as I can judge, that came to see me in Ansonia.

588 Re-D. Q. About what did he talk to you?

A. I can't remember just exactly just what it was he said. He spoke about Sawyer-Man—the Sawyer-Man lamp. I can't remember what it was he asked me. I suspected there was some trouble about it, and I didn't want to have anything to say about it.

589 Re-D. Q. Did he come to see you again?

A. No, sir.

590 Re-D. Q. Did you see him again?

A. Mr. Man took me over to his office, spoke a few words concerning what I knew about the lamps, then, I believe it was last

Tuesday night—Monday, I guess it was—I am not sure whether it was last week or not—I think it must be the week before last—I know it was before Mr. Russell came to see me—I think it must have been Tuesday night of week before last, I had a note given to me to go and see Mr. Broadnax.

591 Re-D. Q. Did you go?

A. Yes, sir.

592 Re-D. Q. What did he talk to you about?

A. He wanted to know what I had done on lamps and different things when I worked for Messrs. Sawyer & Man.

593 Re-D. Q. Did he ask you about paper carbons?

A. Yes, sir; wanted to know if I hadn't seen them. I told him that I hadn't seen any or heard of any, only what I had seen and heard of in Ansonia.

594 Re-D. Q. You say Mr. Man took you once to Mr. Broadnax; how did Mr. Man come to see you?

A. Mr. Man was settling the business for the house I have been lately buying, and from there he took me over to New York
425 here somewhere. He took me to his office; from there I went with Mr. Man to Mr. Broadnax's office.

595 Re-D. Q. From the time you first saw Mr. Russell in Ansonia until he called on you here in New York, to ask you to come to see Mr. Dyer, did anybody whom you know, or believe as in any way connected with the Edison Company, or Mr. Russell, or Mr. Tomlinson, Mr. Dyer or myself come after you in any way?

A. No, sir.

596 Re-D. Q. Besides Mr. Broadnax and Mr. Russell do you know any of the others who came to you at Ansonia?

Objected to as incompetent, the witness not having identified Mr. Broadnax sufficiently as a man who came to see him at Ansonia.

A. No, sir; I do not.

597 Re-D. Q. Was the Mr. Broadnax who was examining you Saturday the Mr. Broadnax you referred to in redirect answer 587?

A. Yes, sir.

598 Re-D. Q. Do you remember Mr. Broadnax coming to see you at Ansonia or not?

A. I remember a man who looks very much like him. When I got in conversation with him here in New York I asked him if he hadn't been to Ansonia to see me, and he said he had.

Adjourned till Tuesday, March 5th, at 11 o'clock.

Defendant's counsel here stated of record that the reason of his adjourning at 10 minutes to 4 is because he has a compulsory reference in the N. Y. supreme court in which an adjournment has been refused.

Adjourned till Tuesday, the 5th inst., at 11 a. m.

426 TUESDAY, *March 5th*, 1889.

Met pursuant to adjournment.

Present: Mr. Griffin, for defendant; Mr. Kerr, for complainant, and Mr. Albon Man; and the examination of Mr. SHARP continued as follows:

599 Re-D. Q. You were asked in cross-question 584 whether you had bought a house lately, and you answered that you had. Did you ever mention this purchase to me or any of the Edison people?

A. No, sir.

600 Re-D. Q. Has the matter anything to do with your testimony in this suit?

A. It does not.

601 Re-D. Q. Going back to your work for Mr. Man in Brooklyn, did you do any work for him there except as you have already testified?

A. I got a recess from the shop; I don't remember how it was; and the switches we were talking about yesterday—the castings—I remember that I formed some slides of sheet brass. That is about as much as I remember on that arrangement. I know that Mr. Man paid me for them when I brought them into the shop.

602 Re-D. Q. Were you ever at Sawyer's shop, 41 or 43 Centre street?

A. No, sir, I was not.

603 Re-D. Q. At your home or shop in Brooklyn did you ever bore several dozen glass base-plates for Mr. Man or Mr. Sawyer?

A. I have a slight recollection of drilling one or two holes, but no such quantity as one or two dozen.

604 Re-D. Q. Where do you remember drilling these holes—in Brooklyn or at Sawyer & Man's?

A. I think I did the first ones at my own home, if any, and I think likely that I done some in Walker street.

605 Re-D. Q. You have testified as to a lamp with a circular carbon. Did you ever see or hear of as many as fifty of those lamps being used at Sawyer & Man's?

A. No, sir.

606 Re-D. Q. How many did you see or hear of?

427 A. I don't remember of more than one, and that is only by making the clamps for holding the carbon.

607 Re-D. Q. Did you ever see as many as two hundred lamps of any kind at Sawyer & Man's?

A. I have not.

608 Re-D. Q. What is your best recollection of the entire number of lamps from the beginning to the end of the time you were at Sawyer & Man's at Howard and at Walker street?

A. I don't remember distinctly of seeing more than one.

609 Re-D. Q. I am not referring to lamps with circular carbons, but lamps of every kind? (The master re-reads the Re-D. Q. 608.)

A. I have no recollection of seeing more than one.

610 Re-D. Q. How many lamps, to your best recollection, were

made at Sawyer & Man's all the time you were there; I mean of all kinds?

A. At that one particular place?

611 Re-D. Q. I mean the lump total of lamps at all the places of Sawyer & Man where you worked.

A. I don't believe I have seen more than fifty.

612 Re-D. Q. What is the greatest number they had at any one time?

A. I don't know that I have ever seen more than a dozen at one time.

613 Re-D. Q. Were these fifty lamps, new lamps, or were some made up of the parts of the preceding lamps?

A. Well, the lamps was mostly all changed one way or other.

614 Re-D. Q. What would they do to the lamps in changing them?

A. Make some difference in the conductors or new works, new holders, or something of that kind. I can't think of all the changes that was made in them.

615 Re-D. Q. Does your total of fifty lamps cover all these changed lamps as well as the original lamps?

A. Yes, sir.

616 Re-D. Q. How often were these lamps changed?

428 A. That is something I can't answer direct. There was no stated time for changing them. I suppose when the lamps didn't work they would make some different change in them. I can't tell how often they were changed. That is as near as I can give it.

617 Re-D. Q. You spoke, on cross-examination, of putting Canada balsam on the glass globe or base of the lamps. Did you put it on hot glass or cold?

A. The glass was, towards the last, all made hot to expel all the air.

618 Re-D. Q. What do you mean by "towards the last"?

A. Towards the last of my working in Walker street.

619 Re-D. Q. When you took the lamps apart did you have to warm the glass?

A. Sometimes I had to.

620 Re-D. Q. Generally, did you have to?

A. No, sir; once in awhile they would stick a little tighter than others.

621 Re-D. Q. You talked about cleaning the works of the lamp and taking them apart; what do you mean by that?

A. In taking an old lamp apart it would get kind of smoky or they would be smoking, and I would have to clean all that off—get everything perfectly clean before putting them together again.

622 Re-D. Q. What parts would you clean?

A. All the parts in the lamp—the metal parts and the carbons and the carbon-holders.

623 Re-D. Q. How did the lamps become smoky?

Objected to as incompetent.

A. By the carbons or pencils burning out.

624 Re-D. Q. If a lamp was brought to you with a burnt-out carbon how long did it take you to take the lamp apart, clean it and do such things as were ordinarily necessary and put the lamp together again?

A. As near as I can think of it it would take about two hours, on an average.

625 Re-D. Q. Would this two hours include the time taken up in charging the lamp with gas?

A. No, sir.

429 626 Re-D. Q. After the lamp was charged with gas what had to be done to it, if anything?

A. They used to be sealed with sealing wax.

627 Re-D. Q. Who, besides yourself, did you ever see cleaning the inside works of the lamps?

A. William Sawyer—the old gentleman.

628 Re-D. Q. Any one else?

A. I don't know whether Mr. Myers would take a hand in it once in a while to help out; I can't remember.

629 Re-D. Q. Besides the one lamp you mentioned with a circular carbon did you see any other lamps with metal clamps for the carbon?

A. They all had a kind of a metal socket with a carbon or pencil holder with the carbon-holders pressed into them.

630 Re-D. Q. I refer only to the carbon which was made incandescent and not to the carbon-holders. Besides the one lamp with the circular carbon, did you see any other lamps in which the carbon pencil itself was held by metal clamps?

A. I never saw a lamp held by metal clamps.

631 Re-D. Q. In the lamp figure 52, page 87, of the Sawyer book, as to which you testified, how was the circular carbon clamped or held (witness shown the book)?

A. It was held by two flat carbons--held in a socket as I have mentioned and two other flat pieces held together by platinum screws and nuts.

632 Re-D. Q. I understood from you yesterday that you wished to correct part of your statement about seeing Mr. Wallace fire out the Sawyer feeder lamps at Ansonia. What correction do you wish to make?

A. I don't know whether I said that I saw or heard of it. When I come to think of it I remember that I was told of it. I was in the same building but did not see anything of it personally—did not see it personally.

633 Re-D. Q. Did you personally see the parts of the feeder lamps lying around as you testified?

A. Lying around the yard?

430 634 Re-D. Q. Either the yard or the rooms at Ansonia?

A. I have seen them laying around the rooms a long time before they was thrown out.

Recross-examination by Mr. KERR :

635 Re-X Q. When did Mr. Broadnax tell you he had been to Ansonia to see you?

A. He did not tell me when he had been there to see me. I asked him if he wasn't one of the gentlemen that came to see me, and he said he was.

636 Re-X Q. When?

A. I believe it was when I went with Mr. Man to his office; some time recently here in New York city.

637 Re-X Q. Was Mr. Man present at the time you allege you had such conversation?

A. I believe he was in the room with me.

638 Re-X Q. How long were you there?

A. Wasn't there more then two or three minutes.

639 Re-X Q. Didn't Mr. Broadnax deny seeing you at Ansonia?

A. I don't know that he did.

640 Re-X Q. Well, then, you don't know that he said he did see you?

A. I know that he said he did, or I very strongly thought he did. I don't like to say right out that he didn't or that he did.

641 Re-X Q. Are you prepared to say that Mr. Broadnax ever talked to you on this subject until you met him at his house in Brooklyn recently—I mean as to the lamps made by Sawyer & Man in 1878 and 1879? Please answer this question yes or no.

A. There was a few words said about the lamps. Mr. Broadnax hadn't time to speak about it. This was at Mr. Broadnax's office, or in the room next to his office, when I went there with Mr. Man.

642 Re-X Q. Are you prepared to say that Mr. Broadnax ever, before that time, spoke to you on the subject of Sawyer & Man lamps? Please answer yes or no.

A. Yes.

431 643 Re-X Q. That you swear was at Ansonia?

A. Well, I can't swear that that was really the man or not, only as I remember him by sight.

644 Re-X Q. After the year 1879, when did you next see Mr. Man?

A. I don't remember seeing Mr. Man from 1879 until the time that Mr. Man settled my house business; as near as I can think it was about two months ago.

645 Re-X Q. Did you ever use anything to pack the flanges at the base of the lamps?

A. Yes, we used to put paper between the metal and the glass.

646 Re-X Q. What was the shape of that paper?

A. Shape of that paper was in rings to fit over the glass globe and one on the bottom had a hole large enough to allow the bottom piece to come through—the cocks or caps—pieces that came through from the lamp.

647 Re-X Q. How did you get the paper washers?

A. I used to make them.

648 Re-X Q. How did you make them?

A. As near as I can recollect, we used to cut them out with a knife and a pair of scissors.

649 Re-X Q. Did you ever have any special tools to cut them out?

A. I don't remember ever seeing any.

250 Re-X Q. Were these paper washers all the same size?

A. They wasn't exactly the same size. I don't believe you could cut two exactly alike. We made a small washer for clamping the works of the bottom glass. That, I think, we had a little brass punch for; I won't be sure, though.

651 Re-X Q. Were the lamps all the same diameter?

A. So far as I can remember, they was towards the last. No, I don't think they were all the same size; not exactly. There might be a quarter or half an inch difference.

652 Re-X Q. What wages do you make now?

A. I don't understand that question.

432 653 Re-X Q. What are you paid for day's work at the present time?

A. I am paid three dollars a day. My wages for Sawyer & Man I don't think was ever more than two dollars and a half.

Question by defendant's counsel:

654 Q. Have you any correction to make as to your wages at Ansonia at the time you came to see Mr. Tomlinson in your answer to cross-question 571?

Said question read to witness.

A. I suppose about that time I was only getting two dollars and a half, but after the election of Cleveland my wages was reduced half a dollar a day.

WILLIAM SHARP.

Sworn to before me,

WILLIAM T. FARNHAM,
[L. S.] *Notary Public and Special Examiner.*

Complainant's counsel requests the defendant to put the sworn statement of William Sharp made by him in June, 1886, in evidence or a copy of the same made by the examiner and so certified.

WALTER K. GRIFFIN, being duly sworn on behalf of defendants, says:

I am one of the counsel for defendant. I first saw the witness, William Sharp, the morning before his examination was begun. I met him at the office of Mr. Dyer, 40 Wall street, New York city, and as the examination of the witness Hochhausen was about to proceed, I requested Mr. Sharp to come with me to my office, 11 Pine street. Mr. Russell accompanied us. On arriving at my office I failed to find a statement of Mr. Sharp which had
433 been given me some time ago, among my papers and I proceeded to ask Mr. Sharp such questions, as in my opinion, were necessary to prepare myself to examine him in this case. I

did not find the statement until the next day, and to the best of my recollection, I never referred to the statement in any way to Mr. Sharp. On Friday, I think it was, Mr. Sharp at the close of the examination for the day, said that as he had not been to the shop his pocket money had about run out or something to that effect. I had no change less than ten dollars and handed him that. He objected to take it, saying he only needed some small change, but I told him he had better keep it.

WALTER K. GRIFFIN.

Sworn to before me—

WILLIAM T. FARNHAM,
[L. S.] *Special Examiner and Notary Public.*

Defendant's counsel requests the examiner to note an adjournment to 2½ p. m. to enable him to procure the attendance of another witness.

Adjourned till 3½ p. m.

Met at 3½ p. m.

Present: Mr. Griffin for defendant and Mr. Kerr for complainant.

JOHN M. D. KEATING, recalled:

1 Q. Have you with you the book of account to which you referred on your former examination?

A. Yes, I have, and here it is.

2 Q. What was your custom as to making entries in the book as to work done for your customers?

434 A. I generally made the charge, and when paid, gave credit for it.

3 Q. Would you do any work which would not appear in the book?

A. Occasionally, when paid cash for it.

4 Q. What class of jobs would that be?

A. Small parts and parcels of experiments that would not be worth making an entry in the book.

5 Q. Do you find in the book any entries of work done in the year 1878 for Mr. Sawyer?

A. I do.

6 Q. Under what date is the first entry?

A. April 20th, 1878. I sent in a bill that day for three dollars.

7 Q. When and what is the next entry?

A. From April 30th to May 4th I charge for sundry jobs, six dollars, and from May 9th to May 18th I charge for sundry jobs, four dollars; May 23d to May 24th, three dollars.

8 Q. What did you charge per hour for your work?

A. As a general thing, fifty cents—at the rate of five dollars a day. I charged Mr. Sawyer fifty cents per hour.

9 Q. How many hours' work out of these entries in April and May, 1878, appear to be for work on electric lamps distinctly?

A. Twelve hours; being the bill for six dollars from April 30th to May 4th, 1878.

10 Q. Can you leave the book with us?

A. I can, but I would like to have it back in case I need — for some future day.

11 Q. With the exception of these entries in April and May, 1878, do you find any entries of work done during that year for Mr. Sawyer?

A. Not until June, 1880.

12 Q. Do you find any entries during 1878, against Albon Man?

A. I do, under date of May 20th and 24th, 1878, to ten hours' work on rise and fall ways, five dollars.

13 Q. Do you remember what these rise and fall ways were?

A. I do not remember.

435 14 Q. Do these entries represent the work done by you for Mr. Sawyer or Mr. Man during the year 1878?

A. Yes, sir.

Defendants offer said entries against Sawyer & Man in evidence to be marked Defendant's Keating Book Exhibit.

It is consented that the master make a copy of the entries in said book and the following is a copy of such entries, the production of the book being waived:

Wm. Sawyer to J. M. D. Keating.

		Dr.		Cr.
1878.				
April 20.	1 bill	$3 00		$3 00
April 30.	½ hour on nuts	$0 25	May 26.	
May 1.	5¼ h'r on electric light, 50c.	2 75	"	$3 00
2.	4 " " "	2 00	May 11.	3 00
	Paid.			
3.	½ h'r " " "	0 25		
4.	1½ h. " " "	0 75		
	12 h. week end'g Sat., May 4th, '78	$6 00		$6 00
May 9.	½ hour on job	0 25	May 18.	4 00
13.	5 hour on cylinder & piston	2 50

		$4 00		$4 00
	Paid.			

Wm. Sawyer to J. M. Keating.

		Dr.		Cr.
May 23.	To 4 hours on sundries jobs	$2 00	June 24.	$2 00
24.	2 " " "	1	July 1.	1 00
		$3 00		$3 00
	Paid.			

3 MERCER ST., LORILLARD OFFICE.

Albon Man to J. M. Keating.

May 20.	10 hours on rise & fall way, 50c	$5 00	$5 00
May 24.	" " "		
	Paid.		

436 Cross-examination by Mr. KERR:

15 X Q. Do you wish to be understood that you did any work for Wm. Sawyer, or Wm. E. Sawyer, which does not appear in your book?

A. Occasionally I would have a small cash job that was not worth while to enter in the book.

16 X Q. How often?

A. Not very often because I always rendered a bill about once a week, as a general thing, whether of large or small amounts.

JOHN M. D. KEATING.

Sworn to before me,
[L. S.] WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

United States Circuit Court, Western District of Pennsylvania.

CONSOLIDATED ELECTRIC LIGHT COMPANY
against
MCKEESPORT LIGHT COMPANY.
} In Equity.

ORANGE, N. J., *March* 6, 1889.

Met pursuant to adjournment.

Present: Messrs. Walter K. Griffin and Richard N. Dyer for defendant, and Thomas B. Kerr for complainant; also present, Mr. Henry M. Byllesby.

It is stipulated by counsel that the deposition of Thomas A. Edison, the witness present, taken in the interference case between 437 Sawyer & Man, and Thomas A. Edison, may be copied into this record (both direct and cross-examinations), as a part of the deposition of Mr. Edison in this case, subject to objections as to materiality, which may be taken *nunc pro tunc* at the hearing.

It is also stipulated that any objections found in said deposition, based upon peculiarities of Patent Office practice, such as that the testimony does not conform to the preliminary statement, shall not be considered pertinent in this case.

In accordance with said stipulation, and Mr. Edison being duly sworn, the examiner is requested to copy into the record at this point Mr. Edison's deposition in the interference case.

The following is Mr. Edison's deposition in the interference case:

THOMAS A. EDISON, a witness produced in his own behalf, being duly sworn, testified as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your age and residence and occupation?

A. Age, 34; occupation, inventor; residence, Menlo Park, N. J.; for the time being living in New York city.

2 Q. Please relate in detail your earliest experiments in the carbonization of paper?

Question objected to unless the experiments were made, or to be used, or with a view of using the paper in electric lighting, and unless the intention was to make the paper in burners for electric lamps.

A. I carbonized paper in the summer of 1876. Such paper was to be used for battery carbons, for non-conductors of heat, and arti-

cles were to be made in different shapes and carbonized. A great many articles were so made and carbonized from paper.
438 Sheets of carbonized paper were used for electrical resistance about that time. Strips of card-board or bristol-board, about a quarter of an inch wide and five inches long were placed in gas tubes and carbonized by placing the same in a furnace and heating the tube to a white heat. The strips were packed in the tube one upon the other and the interstices filled with charcoal powder. Sheets of tissue paper were laid in iron boxes, fifty to a hundred deep, on the top of which was laid a weight of metal so that the carbon would remain straight after being carbonized. Also sheets of thick bristol-board several inches square were carbonized under strain to keep them straight. Some experiments were also made to carbonize small crucibles made out of bristol-board.

Counsel for Sawyer and Man objects to the answer as going to show that the invention was made before the date named in the preliminary statement, in so far as it bears on the making of the carbon-electrode of paper for the electric lamp.

3 Q. How extensive were these experiments, and what person, if any, had knowledge of them?

Same objection as to former question.

A. The experiments were quite extensive. My intention was to go into the business of making carbon wire for various purposes, electrical and chemical, for electric lighting and batteries. A company called the American Novelty Company was to handle the goods in connection with a gentleman named James, who is now dead. Mr. Charles Batchelor and, I believe, Mr. E. H. Johnson, saw many of the experiments. Mr. Adams, one of my assistants, now dead, helped me in the experiments. I would mention that we also carbonized wood made up in various shapes, as well as paper.

439 4 Q. What was the quality of the paper carbon produced at that time in the way you have described?

Question objected — on the same ground as before.

A. They were very fair carbons after we had got the idea of carbonizing them under strain and pressure.

5 Q. Did you, at that time, determine the quality of these paper-carbon strips as to electrical resistance?

Question objected to on the same ground as before.

A. Yes. We placed them in electrical circuits and worked sounders through them. We also placed one of the crucibles in circuit, and boiled water by the heat engendered by the passage of the current.

— Q. Did you test the electrical resistance of this carbonized paper as compared with various metals?

Objected to as impertinent.

A. Yes, sir; we did, as one of the uses of the paper was to make rheostats, and we concluded that the carbon would be suitable for rheostats. The resistances of the various strips were not wide apart from each other The resistance as compared to metal was very much higher.

7 Q. Please state in detail your next experiments with carbonized paper, and when such experiments were made.

A. My next experiment with carbonized paper was the use of the same in a telephone, about May or June, 1877. We made telephones in which a great number of sheets of carbonized paper and bristol-board paper were placed between the electrodes in a telephonic circuit, and were agitated by the movements of a diaphragm for the purpose of transmitting articulate speech. In fact, in 1877, we tried every conceivable form of carbon in telephones.
440 About August or September, 1877, strips of carbonized paper were placed *in vacuo* and brought up to incandescence. Many experiments were tried upon the incandescence of boron, silicon and carbon, in air and *vacuo*, about that time. My impression is, that two gentlemen, Dr. Cornelius Herz, now in Paris, and Stephen D. Field, were witnesses to some of these experiments, whether the boron, silicon or carbon experiments, I cannot say. Also Mr. Charles Batchelor Adams, who is dead, and others whom I cannot remember, saw these experiments. I think Herz and Field saw these experiments in September of 1877.

8 Q. Please explain as fully as you can how these last-named experiments, in 1877, were conducted.

A. Two rods of brass, sliding in bearings forming the two poles of the battery, had upon their ends small clamps in which different substances could be clamped. In these clamps strips of carbonized paper were placed, about an eighth of an inch wide and two inches long. The paper used for carbonizing was bristol-board. The carbon was brought up to incandescence, but quickly oxidized and was destroyed as it was in the open air. Attempts were made to coat the carbon with powdered glass, so it would melt and run over the carbon and thus preserve it. This did not work. Then experiments were tried on pieces of silicon, which the books stated did not oxidize when in incandescence in the open air. Also upon boron; but these did not succeed well as they were in very small pieces, and we could not make good contact at the electrodes. Afterwards we tried the experiment *in vacuo* with a common air pump, but the vacuum that we were able to get was so poor that the carbon oxidized almost as rapidly as it did in the air.

9 Q. Have you any sketch of the construction used for holding the carbonized paper conductor mentioned in your previous answer? If so, produce it. If you have not such sketch, please make one now, to be attached as an exhibit in this case.

A. I think I have the original apparatus which I believe I can produce, and will do so if possible.

441 10 Q. In this apparatus referred to, was the carbonized paper strip an incandescent conductor suitable for use in an electric lamp?

Question objected to unless the strip was afterwards used in an electric lamp, or intended for one at the time.

A. It was used as an incandescent conductor in an electric lamp, but not under proper conditions.

11 Q. When was this experiment made?

A. I think about September, 1877.

12 Q. Why did you not refer to these experiments in your preliminary statement filed in this interference?

Objected to as incompetent, irrelevant and immaterial.

A. The experiments had, I think, slipped my memory when I made out the preliminary statement.

13 Q. Please state in detail your next experiments in this connection.

A. The next experiments took place, I think, in October or November, 1878. My assistant, Mr. Batchelor, made a great number of paper carbons, fifty or upwards, which consisted of tissue paper, and other kinds of paper, coated over their surface with a mixture of lamp-black and tar, and then rolled up in the form represented by a knitting needle, and afterwards carbonized by heat. These were included in electrical circuits and brought up to incandescence *in vacuo*. They were also used in a lamp devised about the same time, which lamp is shown in my patent 224,329, where the light was given by the incandescence of the carbon at the point of contact between the electrodes. The carbon did not last very well *in vacuo*, and we found it very difficult to clamp it so as to prevent the large current used from producing an arc at the point of contact, but in a form of lamp similar to that shown in patent 224,329, they gave better results.

14 Q. What degree of use was made of the electric lamp last described?

442 A. We burnt them for several hours at a time, but the best results were obtained with wood carbons.

15 Q. Are any of those lamps now in existence?

A. I do not think so. I think there were one or two made and then used for other purposes.

16 Q. Does the drawing of the patent you have just referred to show fairly the construction of the lamp which was made and used at the time named?

A. It does; but we made other forms not shown in the patent. I have represented these in a sketch which I now produce, marked Edison Exhibit 1. In this exhibit figure 1 represents a spring *a*, secured to pillar B. Upon the extremity of the spring is a clamp *c*, for securing the carbon. The lower extremity of the carbon rested upon iridium-pointed prongs *e*, *d*, *f*, at the point *x*, the tension of the spring acting to press the carbon slightly against the iridium points. Sometimes the current was passed through the wire *g*, through *a*, thence through the carbon to the points and out by the wire *l*, which connected to all three points. At other times the current was passed through the wire *h*, thence through the point

d, across a portion of the carbon, thence to the point *e*, and wire *k*. This latter method is shown better in figure 4. In this figure the spring *a* is dispensed with, and a weight, *c*, is used to press the carbon against the two iridium-pointed electrodes *e*, *d*. The current passing from *d* to *e*, through a portion of the carbon, caused it to become incandescent, and as fast as the carbon wore away by oxidation it was fed down by the action of the weight, or even by the weight of the carbon itself. In figure 2 the current passed through the point *h*, across the carbon strip, thence down through the point *k*, rendering that portion of the carbon between the two electrodes incandescent. The contact between the two points was brought about by the weight of the carbon paper. The whole apparatus was placed at an angle. In figure 2½ is shown about the angle at which the paper was placed, *x* being a limiting stop for the downward passage of the carbon. It was so arranged that if the
443 points *h* and *k* were taken away the paper would fall between
the support *g* and limiting stop *x*. Figure 3 shows a modification of the apparatus in figure 1, a mercury cup being placed on the top of the carbon, in which a platina wire was in contact with the mercury, *a* being the mercury cup, *g* the platina wire. In the patent No. 224,329 a ball of iridium was used upon the upright metallic portion of the electrode, upon which the contact between the carbon and the iridium took place, as seen in figure 2 of the drawing of the above-mentioned patent.

17 Q. In the instances named of patent 224,329, and the modifications just explained by you and shown in your Exhibit No. 1, were the conductors of carbonized paper?

A. Yes, sir. A great many of them were carbonized paper—a few were made out of wood.

18 Q. In all the above-named instances was provision made to keep the electric continuity intact, and prevent the formation of an electric spark?

A. Provision was always made for the passage of a continuous current, the light given was partially due to an arc and partially to electrical incandescence.

19 Q. Can you give any instances of electric lamps of other inventors operating in substantially the same way?

Question objected to as incompetent, impertinent and irrelevant.

A. I believe the Werdermann lamp operates in the same manner, also the Joel lamp, now operating in London; and I also believe Mr. Sawyer's late lamps act somewhat on this principle.

20 Q. Are these experiments just described as having been made in October or November, 1878, referred to in your preliminary statement?

Question objected to as incompetent.

A. Yes, sir; these and other experiments made about the same time.

444 21 Q. Please relate fully the other experiments referred to in your previous answer?

A. We, in November or December, 1878, had our vacuum pump placed in order to conduct some experiments on incandescent carbon conductors *in vacuo*, and we tried a great number of experiments with paper carbons, wood carbons, and carbons made with carbonized broom corn. What we desired at that date, and had concluded as the only possible solution of the subdivision of the electric light, was that the lamps must have a high resistance, and small radiating surface, so as to be capable of being worked in multiple arc commercially, and our calculations showed us that the lamp must have at least 100 ohms resistance to compete successfully with gas, otherwise, if the lamps were of low resistance, the cost of the main conductors would be so great as to render the system uncommercial. What is meant here by a subdivision of the electric light is, that many thousand lamps could all be placed upon a single circuit, and be entirely independent of each other. We, from our previous experiments, knew that we could get the requisite resistance and small radiating surface necessary for a commercial use of the light by means of carbonized paper or wood; and therefore, while working to accomplish this end by means of platinum, we endeavored, by a more perfect vacuum, to obtain incandescent conductors of carbon, which would give us the result. But our experiments in November, as before mentioned, with a good pump, wherein we used paper and wood carbons, were not so satisfactory as the experiments we were conducting with platinum conductors. When we made the carbon in such a form as to have a small mass and high resistance to suit our purposes, it would last but several minutes. We then laid these experiments aside, and went on with platinum, to endeavor to obtain a lamp of high resistance, and small radiating surface. The results of our experiments are shown in patents No. 227,228, 227,227, 227,229. The great point we desired was a lamp of high resistance and small radiating surface, and it did not matter very much whether it was of carbon or of
445 platinum. The necessity of these features, and the necessity of the single-lamp multiple arc system, is more particularly set forth in a British patent No. 2402, dated the 17th of June, 1879, in lines 12 to 37, inclusive, 3d page. Also from line 98, page 1, to line 27, page 2, of U. S. patent 227,229. Also in U. S. patent 223,898. Nearly the whole of this patent gives information on the subject. Returning to the experiments mentioned at the beginning of this answer on incandescent paper, and other carbons, we found our endeavors blocked in the matter of obtaining incandescent conductors of high resistance, and small radiating surface, by the fact that we could not make them last for any length of time in the best vacuum obtainable with our air-pump, which was considered a good one. But when, in the course of our attempts to attain the same object by means of incandescent platinum, we had procured a Sprengel mercury pump, and ascertained that we could get exceedingly high vacua, it occurred to me that, perhaps, a filament of carbon could be made to stand in the sealed glass vessels which we were using, exhausted to a high vacuum, and in October, 1879, we made lamps of paper carbon, and carbons of common sewing

thread placed in a receiver made entirely of glass, with the wires sealed therein by fusion, and the whole exhausted by a Sprengel mercury pump to nearly the one-millionth of an atmosphere, and these filaments of carbon, although excessively fragile, owing to their small mass, had a similar radiating surface and higher resistance than we had hoped; we had reached the conditions where, notwithstanding the carbons were small in mass and filamentary, they were stable. Sufficiently so to allow of the economical subdivision of the electric light and the possibilities of competing commercially with lighting by gas. It was the new conditions which caused this lamp to be a success, which conditions were high vacuum in a receptacle in which no deterioration or lowering of the vacuum occurred to destroy the carbon. These experiments resulted in the lamp and various modifications and forms, 446 more particularly set forth in my patent 223,898, and in the application now in interference.

22 Q. Please state what you were doing in the way of experiments upon this subject between November or December, 1878, and October, 1879.

A. I was endeavoring to obtain a lamp of high resistance, for instance, a hundred ohms, with small radiating surface, the former to permit of economical subdivision, and the latter to permit of economy in the use of electric power, and I used platinum and platinum-iridium wire during that time to attain this result, all of which are more particularly set forth in the patents which I have heretofore recited; in conducting these experiments we made a great variety of platinum lamps in which a major portion of the wire was so coiled as to not radiate light, to the end that the lamp might have a high resistance; one of these forms is shown in my patent 227,229.

23 Q. At what date did you begin to make glass bulbs or shells especially adapted and used for electric incandescent lamps?

A. I think separate lamps, independent of the air pump, were made either in December, 1878, or January, 1879, except the device used in 1877, which was capable of being detached from the pump and placed in any position, but my impression is that the first vacuum bulb for an incandescent conductor that would hold its vacuum was made in June or July, 1879; this was made entirely of glass, with the conducting wires sealed therein and the vacuum obtained with a Sprengel pump; a platinum conductor was used with these lamps; it might have been as late as August, 1879; I will look over some of my memoranda to-night and refresh my memory on that point.

24 Q. When did you produce electric lamps with incandescent paper carbon conductors in vacuum bulbs, hermetically closed, so as to be a commercially complete lamp, capable of entering into competition with gas lights?

A. I made such a lamp about October 22d, 1879, which 447 had the characteristics of high resistance, small radiating surface, and sufficient stability and economy to allow of competition with gas.

25 Q. What was the extent of your manufacture and use of such lamps thereafter?

A. We commenced immediately to make a number of vacuum pumps and started to manufacture these lamps of paper carbon, with the pump we had on hand; during November we made a great number of lamps of this character, perhaps as many as one hundred; these were put up in the laboratory at Menlo park, and various experiments tried with them, among which was a test of their candle power, economy, resistance, lasting time at various degrees of incandescence; in the latter end of November, 1879, we commenced operations with a view to get our dynamo machines, regulators and wires in order, to make a public exhibition of these lights.

What I mean by a public exhibition is a more general exhibition, as everything that I did in my laboratory for the last three or four years was seen by thousands of persons from all parts of the world. A great many persons visited the laboratory to see the lights in operation in December, 1879, caused by an intimation in one of the daily papers that my electric lights were burning. But on December 21st, 1879, the "New York Herald" published an account of my experiments, a copy of which article is now furnished, marked Edison's Exhibit No. 2.

On December 25th, 1879, I had lighted up my laboratory, my office and two or three houses, situated about a fifth of a mile from the laboratory, and also about twenty street lights. On New Year's eve, 1879, about 3,000 people visited Menlo park, and thereafter to the present time all my experiments have been public. I have made probably 3,000 lamps containing the paper carbon conductor, now in interference.

Some time in the spring of 1880, I lighted up the steamship "Columbia" of the Oregon Steam Navigation Company, with about seventy-five to a hundred lamps containing paper carbons, which continued to light the ship satisfactorily for several months.
448 Exhibitions of the same were made on the steamship "Columbia" at Rio Janeiro, Brazil, Valparaiso, Chili, San Francisco, California, and Portland, Oregon. I understand some of the lamps were lighted during the voyage around Cape Horn, and were kept lighted from San Francisco to Portland on the regular trips for several months, and I have recently shipped several hundred lamps to replace the ones broken. Since that time I have tried an enormous number of experiments to cheapen the cost of my lamps, to increase their length of life, and economy and resistance. The nuclei for manufacturing the lamps, established at Menlo Park, in November and December, 1879, have been expanded into two large factories, one situated at Menlo Park and the other at East Newark, N. J. The factory at Menlo Park employs about one hundred hands, turns out about one thousand lamps per day, and has manufactured about sixty thousand lamps. The factory at East Newark is being arranged to manufacture fifty thousand lamps per day.

26 Q. Returning now to the paper carbon incandescent lamps made by you in the winter of 1879–'80, what actual use were they

subjected to, and what was the extent of their durability as lights; also what was the quantity of light produced by each lamp according to gas standards?

Objected to as incompetent, irrelevant and immaterial.

A. Each lamp gave about 12 to 16 candles of light. They were put up on chandeliers and run until they were destroyed. Some of them were run all day and night, and others by night. A record was kept of the hours each one ran, which record I have here. The lamps are numbered from 142 to 417. Examining this record to refresh my recollection, I am able to state that, for instance, lamp 142 lasted 404 hours; lamp 159 lasted 480 hours; lamp 189 lasted 217 hours; lamp 255, 294 hours; lamp 223, 262 hours; lamp 167, 15 hours; lamp 204, 16 hours; 203, 17½ hours; lamp
449 155, 280 hours; 201, 280 hours; 164, 322 hours; 172, 259
hours. Looking over the whole record, I should judge the average life was about 300 hours. I remember two lamps, one of which lasted 1,350 hours, and another one 940 hours, cut from the same mold and of the same size and same paper as the lamps I have mentioned by numbers. The numbers I have given occur on the pages of the book consecutively.

By agreement of counsel, here made, the book of record referred to in the above answer is tendered to counsel for Sawyer & Man for use in cross-examination, and copies of so much of the record as has been testified about by the witness, being pages 1 to 15 inclusive, are attached as exhibits and marked Edison's Exhibit No. 3.

27 Q. Since testifying on Saturday, have you made examination among your papers and exhibits at Menlo park with reference to your early experiments in electric lights in which carbonized paper was used as a conductor; if so, produce what you have found and explain the same?

A. I have made such an examination. I produce an electric lamp in which experiments were made with a paper carbon brought up to incandescence in vacuo. This lamp was used about September or October, 1877. The apparatus orig-ally was one for illustrating Geissler tube action in vacuo. The base of the apparatus fitted over the hole in the platen of the air-pump. It was then exhausted and the cock turned to preserve the vacuum in the globe of this lamp. We did not succeed in getting a higher vacuum than 2½ millimeters on the mercury gauge, and we could not make the carbons burn more than a few minutes at a time. Some of the crrbons were brought up to brilliant incandescence, and probably gave thirty or forty candles of light. The carbons were brought up to various degrees of incandescence. The carbons were made of sheet paper, of various widths and thickness. I think
450 they were made of bristol-board. They were from three-
sixteenths to a sixteenth wide and probably from eight to fifteen thousandths thick. I believe they were carbonized in tubes made of gas pipe. I cannot remember whether they were prepared at the time or were on hand; we had an immense collection of

carbonized paper and wood on hand, which we used in our telephonic experiments in 1877.

The lamp referred to in the above answer is put in evidence, and is marked "Edison's Exhibit First Incandescent Lamp."

Counsel for Sawyer & Man objects to the exhibit upon the ground that it goes to show, and is intended to show, that the invention was made previous to the date alleged in the preliminary statement of Mr. Edison, in this interference, and he objects to all that part of the answer that is intended to show or goes to prove that the invention was made previous to the time alleged in such preliminary statement, and gives notice that upon the hearing of this interference he will move to strike out the exhibit and all that part of the answer objected to.

28 Q. Can you explain now why you did not refer to this exhibit in your preliminary statement?

Objected to as incompetent, immaterial and irrelevant. Notice of motion to strike out at the hearing.

A. I had forgotten about the experiments. I had forgotten that
I had the exhibit, and it only came to my recollection Saturday, in
conversation with my assistant, Mr. Batchelor. The results were
probably not sufficiently satisfactory to impress it upon my mind.
I try so many thousand experiments in all branches of physics
that I sometimes forget some of them. The preliminary
451 statement was made at a time when I was under great
strain and crowded with people at my laboratory.

Answer objected to upon the same ground stated in the objection to the question. Notice of motion to strike out at the hearing.

29 Q. If you have any other exhibits found by you at Menlo Park on your late search, please produce such with full explanations?

Question objected to upon the ground that it is incompetent, unless it is intended to call out evidence to show that the invention was made subsequent to the date stated in the preliminary statement.

A. I present an exhibit which serves to refresh my memory regarding the experiments tried on electric light in 1877. The exhibit is dated November 1st, 1877, witnessed by Charles Batchelor, myself and John Kruesi, and I know the signatures to be their handwriting. In this exhibit is shown lamps giving light by the incandescence of boron, silicon and other substances included in the electric circuit, such lamps being arranged in series and in multiple arc. The experiments with carbonized paper in vacuum were made previous to the date of the exhibit of November 1st, 1877.

Answer objected to as intended to show that the invention in controversy was made previous to the date given in the preliminary statement of Mr. Edison.

Notice of motion to strike it out at the hearing.

Paper referred to put in evidence and marked Edison's Exhibit No. 4.

Exhibit objected to on the grounds stated in last objection, and notice of motion to strike out repeated.

452 I now produce another paper, dated December 3d, 1877, which serves, like Exhibit No. 4, to refresh my memory regarding experiments with the paper carbon. This paper is witnessed by myself, Charles Batchelor and John Kruesi, and I know the signature to be their handwriting. It refreshes my memory as to the fact that we were trying to subdivide the electric light into a small number of burners, where the circuit was closed by solid conductors, and the reason why experiments were conducted with boron and silicon was because they were not subject to oxidation like carbon, which we had previously tried, and which did not last as long at a white incandescence as pieces of graphitoidal silicon, forming part of the electric circuit, and rendered incandescent by the passage of the current. The results of the carbon experiments, and also of the boron and silicon experiments, were not considered sufficiently satisfactory, when looked at in the commercial sense, to continue them at that time, and they were laid aside.

The paper referred to in the above answer put in testimony and marked "Edison's Exhibit No. 5."

Paper exhibit objected to as impertinent and irrelevant, and as intended to show that the invention was made previous to the date mentioned in the preliminary statement.

Notice of motion to strike it out at the hearing.

30 Q. Please state whether or not the paper Exhibits No. 4 and No. 5 were written at the dates given upon each of them?

A. Yes, sir; they were.

31 Q. State whether or not your memory is distinct as to the fact that the experiments with boron and silicon, mentioned in these exhibits, were made after your experiments with carbonized paper conductors, and after the employment of such conductors in 453 the lamp marked "Edison's Exhibit First Incandescent Lamp?"

Same objection as before, and same motion.

A. I am certain it was before, because we used boron to get rid of oxidation, to which the carbon was very sensitive.

32 Q. If you have any other exhibits relative to the matter in question, found in your late search at Menlo, please produce the same with explanations.

A. I present a lamp which is one of my well-known carbon horseshoe lamps, made, I think, some time in December, 1879, and is of the same kind and character as those made in October, 1879. This lamp is illustrated in the New York Herald of December 21st, 1879, heretofore put in evidence.

33 Q. State, if you please, in that connection, whether or not this lamp was actually put in circuit, when and where burned, stating the length of time, and the amount of light given by it.

A. I find that its number is 235, and on referring to my note book, I find that the lamp either burnt seventy hours and eighteen minutes or 250 hours and forty minutes, as the record is obscure. It gave a light of probably from twelve to sixteen candles. It is one among a hundred that were burning at the same time. One lamp which I have previously mentioned, made in the same way and in the same manner of carbonized paper, lasted over 1,300 hours, and I believe that the lamps of this character made in the regular way had an average life of about 300 hours, which was sufficient to render them a commercial success in competing with lighting by gas. Had they but lasted an hour, or if the average life of a great number of these lamps were only a few hours, they would not have been a commercial success, and the results would have been of no benefit to the public.

But these lamps, in addition to the fact that they lasted for a long time, had other characteristics, without which, even with a long life,
they would not have been available for competing with gas.
454 These important characteristics were that they were of high
resistance, of small radiating surface, and hence economical, for the reason that smaller conducting wires could be used for conveying the current, as owing to the high resistance of the lamps weak currents were only necessary and sufficient energy to produce the result was forced through the wire and lamps by increasing the electric pressure or electro-motive force. If lamps of low resistance were pleced in multiple arc in a single circuit, the aggregate resistance of all the lamps would be very low, and conductors of correspondingly large dimensions would have to be used, otherwise a great loss of current in the form of heat would take place on the conductor. Hence, if the resistance of each lamp was made, say 100 times greater, then the conductors could have a hundred times less area, and the losses would be the same in both cases. With small radiating surface less energy is required to produce a candle power than on a larger surface. Again, economy is attained from the fact that these filaments of carbon, being small in mass, do not conduct any heat better than they do electricity, and therefore very little heat is conducted from the glowing incandescent conductor to the clamps and supports for the same. Hence no special appliances are essential to get rid of the heat of conduction, as are employed in the type of lamps experimented upon by Mr. Sawyer. Again, high vacua render the carbon horseshoe practically stable and at the same time result in great economy in the use of electricity, as practically all the energy is lost by radiation, and none by conduction. My experiments have shown that if the carbon horseshoe is placed in an atmosphere of nitrogen at the atmospheric pressure, which is the method adopted by Mr. Sawyer in his lamp experiments, it requires nearly twice as much electricity to bring the horseshoe up to the same candle power as it does when the horseshoe is in a high vacuum. As in the former case, heat is lost by conduction through the gas, which serves to carry it to the inclosing globe, from which it radiates invisibly. Hence this lamp is,

I believe, the first one ever produced that was commercially
455 available for competition with lighting by gas, and of great public utility.

This lamp, No. 235, was made at my own laboratory at Menlo Park, some time in December, 1879, was put up in a street lamp at the top of the stairs in front of the depot at Menlo Park, a fifth of a mile from the laboratory, and there burned until destroyed. I think it was made a few days before it was put up. According to its record I find it had burned forty hours, previous to January 3d, 1880. It was seen along with about a hundred others like it, by at least twenty-five thousand people, in December and January. At least, that is my impression.

All that part of the answer after the ninth line (fourth printed line) is objected to as irresponsive, and a mere lecture on the best proportion for making a lamp and burner, in Mr. Edison's opinion.

The lamp referred to in the previous answer is put in evidence and marked "Edison's commercial incandescent electric lamp."

34 Q. Please point out the peculiarities of construction which make this lamp of practical value as compared with other incandescent lamps, and particularly those produced in accordance with the inventions of Sawyer & Man?

A. I have already stated that in my previous answer, to which I refer as an answer to this question.

35 Q. Please state whether or not this exhibit is one of the class of lamps of which you have testified previously that about 3,000 were made, and if there were any differences in construction in any of the 3,000 lamps, please state what such difference were?

A. They were the same, except, perhaps, in the shape of the clamps for holding the carbon, and in the form and method of clamping the paper horseshoe carbon to the wires that passed through and were sealed into the glass.

456 36 Q. Calling your attention to this exhibit, please describe fully the bulb or globe, stating when and where it was made and by whom, and the advantages connected with its form and size?

A. The lamp was made some time in December, 1879, I think by a person named Boehm, who was employed as a glass-blower at my laboratory at Menlo Park. The great advantage of this form and kind of inclosing chamber is that, unlike all previous attempts made for lighting by the incandescence of carbon, the incandescent conductor is placed in a chamber made entirely of glass, the wires forming the leading-in conductors passed from the exterior to the interior of the chamber, and sealed by fusion of the glass where they pass through it. Hence, these glass chambers when exhausted to high vacuum preserved the exhaustion constant, and thus provide the all-essential condition for high economy and length of life of the thin filament of carbon which it is essential to use to attain high resistance, to permit of the economical subdivision of the electric light. All attempts, I believe, heretofore have failed to preserve the vacuum, where a vacuum is used, and thus preserve the carbon, for the reason that the chamber was not composed entirely of glass but of glass and metals, and materials between the glass and which there was a difference in coefficient of expansion, which at times admitted the air; hence, most inventors have used a supposably inert gas in the chamber at atmospheric pressure, and the leading-in wires have not been passed through the glass and fused therein, which is an essential feature. The form and size of this lamp are very convenient, as it is small, light, portable, durable, and admits of radiating the light in all directions so that practically none is lost. Its size is such that it contains very little air, hence, is quickly and economically exhausted of the same in the process of manufacture, and the whole lamp is so light as to be used on chandeliers now used for gas in great numbers.

37 Q. Referring to the same lamp, please describe the leading-in wires and the incandescent conductor, and state the advantages connected with the form and size of the same. 457

Objected to as immaterial, impertinent and not bearing upon any issue in controversy.

A. The leading-in wires to within a quarter of an inch of the glass are formed of copper. To these copper wires are secured, by soldering, platinum wires, which pass through and are fused in the glass. Upon the extremity of these wires, within the chamber, are clamps, which serve to clamp the broadened ends of the filament of carbonized paper. This broadened end is essential to permit of a proper clamping and electrical contact, as the increased conductivity of the broadened end to the electric current prevents it from becoming incandescent. Hence, little arcs and bad contacts at the point of clamping, which would tend to destroy the lamp do not take place. If the filament of carbon was of the same size all over, so that the portion clamped was no larger than the portion which was incandescent, the lamps of this character would be rapidly destroyed by the formation of small arcs at the point of clamping, which throwing out the vapor of carbon and platinum within the vacuum would permit of the formation of a large arc between the *the* two leading-in wires, and the lamp would be instantly destroyed. The paper horseshoe being of small radiating surface and small in mass, is very flexible, and after the passage of the electric current very tough. Hence the lamps may be handled, practically, with impunity as far as breaking the carbon horseshoe is concerned. In fact, after the current has passed through the horseshoe the two broadened ends may be taken in the fingers and pulled out nearly straight without breaking. The advantages of the horseshoe shape are, that it permits of the expansion and contraction of the carbon freely without injuring it, and also permits of nearly all the light being utilized—in fact nearly the maximum amount. The necessity of using platinum to seal in glass is, that of all metals its coefficient of expansion is nearest glass, and hence the glass and platinum will expand and contract together under differences of temperature and thus prevent leakage of air or cracking of the glass chamber. 458

Same objection to answer as to question.

38 Q. Please state how the carbon conductor in this lamp and those like it was made, and where?

A. The carbon conductor was made at my laboratory at Menlo Park, either in October, November or December, 1879, in the manner and of the material described in my application, now in interference.

39 Q. Please state how you exhausted the air from this lamp and others made like it?

A. We exhausted the air by means of a double glass pump—one part of the pump being known as a Geissler pump, and the other as a Sprengel pump, in which mercury was used in the well-known manner. The apparatus is shown on page 99 of my note book No. 85 (a copy of which sketch is produced and put in evidence and marked Edison's Exhibit No. 6).

Exhibit objected to, as being secondary evidence, being an alleged copy, and not the original referred to by the witness, and the copy not being produced.

Counsel for Edison states that the sketch referred to is one of the pages of a very valuable book of original records, which book is now tendered to the counsel for Sawyer and Man, for inspection, and that a tracing copy will be furnished as soon as it can be made and before the examination of this witness is closed.

40 Q. To what extent was exhaustion produced by the apparatus described?

A. I think the exhaustions were carried beyond the millionth of an atmosphere. We had on this apparatus a McLeon gauge to measure the degree of exhaustion. In the notes which accompany this sketch it is stated that a vacuum was obtained where the 459 jump spark from an induction coil jumped five (5) inches in air rather than pass across between electrodes a quarter (¼) of an inch apart in vacuum. This denotes exceedingly high vacua, exceeding the millionth of an atmosphere.

41 Q. When was the sketch referred to made?

A. It is dated October 2d, 1879, and witnessed by S. D. Mott and myself. The drawing was made by Mr. Mott, and it was I think made on the day of date. The notes are in the handwriting of Mr. Upton. I think the notes were made about the same time.

42 Q. Please read from these notes whatever refers to the construction and mode of operation of the vacuum apparatus shown in the sketch.

A. I will furnish a copy of the notes referred to, taken from the book, which copy will be marked Edison's Exhibit No. 7.

Mr. Broadnax objects to the notes, because it appears that they were not made by the witness himself or in his presence.

43 Q. Whose property is this book, and under whose direction and by whom were the entries made in it?

A. The book belongs to myself. It is one of about two hundred or more books in which my experiments in electric lighting are recorded. The entries relating to this exhibit were made by Francis Upton, my assistant, under a general direction from me. The sketch itself was made by Mr. Mott, another one of my assistants.

44 Q. Please describe briefly the manner in which the apparatus shown in the sketch referred to operates in exhausting air from lamps, and if necessary to make the sketch more clear, put additional letters of reference on the parts.

A. The bottle at the top of the pump is the mercury reservoir, leading from which is a rubber tube through which the mercury passed up to the first glass tube on the left-hand side of the pump board. The mercury then passes into the air trap G, then around
the bent tube to the contraction F, through a small tube
460 within a bulb, thence dropping down the second tube on the
right to D. These drops of mercury, in dropping, acted as pistons, between which the air was confined, after the manner employed by Sprengel. E X is the McLeod gauge for measuring the degree of exhaustion. A bottle on the left lower corner, containing mercury, was connected to the McLeod gauge by a rubber tube. When this bottle was lifted the mercury passed up in the round bulb of the gauge and forced what residual air there was up into a tube with a capillary base and with a paper scale behind it. The two tubes on the right of the pump stand form the well-known Geissler pump. The mercury bottle at the lower end on the right was connected to the second glass tube on the right of the pump board by a flexible rubber tube. A stop-cock B being turned so that no mercury could enter the main vacuum apparatus, the bottle was lifted and the mercury ran into the chamber in the upper part of the tube, filled it, and forced what air there was in it over into and down the first tube on the right to the trap D, and thence to the atmosphere. The mercury bottle was then lowered, and the mercury ran out of the chamber, leaving a vacuous space. The cock B was then turned so that the chamber formed part of the general vacuous space of the pump. The bulbs on the right-hand corner at the top were the lamps, which were all sealed by fusion with each other and then to a tube provided with a ground-glass stopper fitting into the vacuum apparatus. A stop-cock on the right near the top served to disconnect the pump from the bulbs or lamps when they were properly exhausted, so they could be sealed off and others put on without losing the vacuum in the pump entirely. The two bulbs on the top and above letters B and C contained phosphoric anhydride, to remove water vapor from the air, and gold leaf, to absorb mercury vapors. Above these is the Geissler spark gauge with the two electrodes. The major portion of the air was taken out by the Geissler pump and the rest of the exhaustion was
carried on by the Sprengel pump.

461 45 Q. In addition to means for making lamps completely,
like that shown in Exhibit Edison's Commercial Electric Lamp, and means for exhausting the air completely from such lamps, what else had you done in the latter part of 1879 towards a perfect operative system of electric lighting by incandescence?

A. I had been devising a complete system for the general distribution of electricity, so as to compete with gas. I had dynamo machines, a station regulator for keeping the pressure constant throughout the system, meters for measuring the amount of current consumed by each customer, street mains for distributing the electricity, sockets for holding the lamps and chandelier appliances, electro-motors for utilizing electricity for power on the light wires, vacuum pumps and devices for the manufacture of electric lamps, carbonizing furnaces, and molds and appliances therefor, and in fact a complete system of electric lighting by incandescence, upon the plan of general distribution over large areas. About the middle of December, the whole system was started and publicly exhibited to many thousand people. Several houses were lighted, besides my laboratory, and twenty street lamps were also lighted. What has been done since that date has been towards means and methods of manufacture, cheapening the processes of manufacture, and establishing factories. In the latter end of December, or in the early part of January, I accepted the proposition of Mr. Villard to light up the steamship Columbia. I immediately went to work preparing to do so. The apparatus was finished and placed on board a few days after she came out of the ship yard, which was, I think, in May or June, 1880.

46 Q. What was the resistance of the lamps made by you in the latter part of 1879?

A. Some of them were as high as 1,000 ohms, but the average resistance of the paper carbon was about 100 ohms when hot.

47 Q. In your late search at Menlo, did you find paper or model exhibits of experiments of 1878, which you are now ready to offer?

462 A. I did not find any apparatus that I was sure was used in 1878 with the paper carbons; but I have a man searching for them. My practice is that when I make apparatus to try an experiment, I keep making changes on this apparatus to try other experiments, many of which have nothing in common with the purpose for which the instrument was first devised. I conduct such a great number of experiments, that I could not afford to keep the original apparatus if it was required to try another experiment, even with a matter entirely dissimilar as to its object.

Counsel for Edison gives notice that, if at any time during the examination or cross-examination of his witness, any exhibits of experiments of 1878 are found, he will put the same in evidence.

48 Q. In all the instances of carbonization of paper given by you in this testimony, was there any other treatment of the paper besides simple carbonization?

A. In the lights made of paper horseshoes, of which there were about a hundred burning at a time, and which I have spoken of as being exhibited to the public, the paper carbons were not treated. Some lamps were made in December, 1879, to see what effect treatment would have, but only a few were made. In the experiments in 1877 with a paper carbon, no treatment of the carbon with any other substance was made except the incidental effect of the grease used in the lamp being decomposed and depositing carbon on the incandescent conductor in the Exhibit First Incandescent Lamp. This was not an intentional treatment. The carbons made in 1878 were generally composed of paper having its surface treated with lamp-black and tar. I believe a few of the carbons made in 1878 were soaked after carbonization in tar, and recarbonized.

49 Q. I call your attention to the printed record of the testimony of A. Man, near the bottom of page 7, where he says "we use principally ordinary blotting paper." Have you had any experience in the carbonization of ordinary blotting paper, and if so, with what results?

463 A. Yes, sir. I have carbonized blotting paper. It makes a loose, non-coherent, friable carbon. Some kinds of blotting paper separate in carbonizing into two or three layers. When a current is passed through it, little arcs occur throughout the carbon, due to the loose contact of one fibre with another. I have made incandescent carbon conductors out of it, but they were not satisfactory.

50 Q. I further call your attention to another paragraph upon the same page of Mr. Man's testimony, at the bottom of the page, where he speaks of "rubbing down and working out by hand the carbon," and ask if you have ever had any experience in this kind of manipulation of paper carbon?

A. I do not conceive how it is possible to rub down a paper carbon made out of blotting paper, without it is very large, such as an eighth ($\frac{1}{8}$) of an inch square, and then I judge it would be exceedingly difficult. I never did this, nor did I ever see any one do it. If the carbon was anything like the flexible filament as shown in my flexible commercial electric lamp, I should say it is impossible. Further, I do not see the necessity of it, as any thickness of paper could have been used, and any desired shape could have been obtained from the paper in the first instance. It is not an easy matter to rub down blotting paper before it is carbonized.

51 Q. I call your attention further in the testimony of Albon Man, answers to the 4th and 18th questions, and ask if paper carbonized electrically as described can afterwards be made incandescent?

A. I have tried many experiments on the carbonization of paper, both by the passage of the current through a filament with plumbago on its surface and also by the passage of current through a platinum conductor on which the paper rested, and always found that the decomposition of the cellulose and water of the paper produced sufficient oxygen to consume all the carbon of the paper, and the result was that nothing was left but the natural ash. These experiments were conducted *in vacuo*. I do not see how it is possible to produce a carbon which could be used in a lamp by
464 simple carbonization of the paper by the heat produced by
the passage of the electric current in an atmosphere of nitrogen, hydrogen, or air.

52 Q. Referring to the 57th and $57\frac{1}{2}$ questions and answers of

Albon Man, what would become of a Florence flask filled with gas as described and subjected to currents of electricity?

A. I have placed illuminating gas in flasks similar to a Florence flask and in which there was an incandescing conductor of carbon, and on heating the same to high incandescence the globes exploded, due to the enormous expansion of the gas and decomposition of the same.

53 Q. Referring to answer to Q. 61 in the testimony of Albon Man, what comment, if any, have you to make on the statement that the oxygen of the salts would consume the paper?

A. I do not see how any oxygen salt would cause the paper to become a conductor. I do not believe there is a dry oxygen salt that is a conductor of electricity sufficient to allow a current to pass through a strip of paper impregnated with it. If it was moistened to permit of conductivity, the moisture would be evaporated before carbonization, because the water could not exist at a high temperature sufficient to carbonize. And if the water was dissipated the oxygen salt would not be a conductor.

54 Q. Referring to the answer to Q. 67 of Albon Man, what comment, if any, have you to make upon that?

A. I do not see that the treating of the paper carbon by a hydrocarbon gas, to deposit hard carbon, improves the paper carbon. If the paper carbon was originally bad, it will always remain so. If it is coated by deposition of hard carbon, the light is radiated then from a hard carbon and not from a paper carbon. If the paper carbon is to have a deposit of this hard carbon placed over it, and within it, it doesn't matter whether the paper carbon is good, bad or indifferent, or is any other form of carbon, or even a metal. The incandescing conductor of the lamp becomes really and truly 465 a hard-carbon conductor, as the major portion of the current passes through the hard carbon and all the light is radiated from it. If a paper carbon is dipped in different hydrocarbons several times and recarbonized each time, a deposit of hard carbon takes place on the surface as well as within the paper. The use of a hydrocarbon for depositing hard carbon by electrical incandescence, is only a method for rendering a useless carbon available in an electric lamp.

It is, in fact, an evidence of the imperfection of the carbon paper.

Answer objected to as being mere argument and not any statement of facts responsive to the question, the answer being mere criticism.

55 Q. In the foregoing answer have you expressed an opinion simply as an expert or spoken from knowledge derived from experiments made by yourself?

A. Derived from experiments made by myself.

56 Q. Referring to the answer of Albon Man to the 80th question, what effect would the glue mentioned in the answer have in the employment of the paper carbon for incandescence in a lamp?

A. The effect would be that when the same was placed in the lamp it would be carbonized, and a great amount of smoke would come out and obscure the globe. This is from my actual knowledge.

57 Q. Calling your attention to the answers of Albon Man to questions 83, 84 and 85, I ask what would be the result of carbonizing the paper described, in the way described, and working it down after carbonization as described?

A. The result of using several thicknesses of blotting paper pressed together would be that when they were carbonized they would all separate, each would be contorted in a different manner, and I do not believe they could be used or worked down, as stated by Mr. Man. I know this from my own experience. Could they have been kept together, which was impossible according to 466 the method of carbonizing described by Mr. Man, they might possibly have been worked down by emery paper, providing they were large enough, but from the sizes given by Mr. Man in another part of his testimony, I do not see how it is possible. It would seem that the proper method would have been to cut the paper in the form desired and then carbonize it, instead of cutting it in a form not desired and then working it down after it was carbonized.

That is a method of manufacturing by machinery or appliances.

58 Q. I call your attention to the sketch Sawyer's Exhibit No. 3, Albon Man, and ask if it would be possible for the spring clamp there shown to clamp the ends of the carbonized paper described.

A. I do not see how a practical lamp could be made with such clamps. Mr. Man has testified that the width of the carbon was from $\frac{1}{12}$ to $\frac{1}{20}$ of an inch, and as these carbons rest upon the plate of platinum *c* in the sketch, the length of the spring portion of the clamps would only be from $\frac{1}{12}$ to $\frac{1}{20}$ of an inch. This is manifestly absurd.

59 Q. I call your attention to the answer of Wm. E. Sawyer to the sixth question, and ask if such a carbon was used as an incandescent conductor in an electric light, what would be the source of light in the incandescent conductor?

A. The source of light would be a hard gas carbon and not the paper carbon.

60 Q. I call your attention to the answer of Wm. E. Sawyer to the eighteenth question, and to what is there stated about candle power, duration of burners, and fracture, and ask you to state from your own knowledge the results that would follow from the various conditions named in the answer.

A. The life of the lamp would depend upon the unit incandescence. Referring to Mr. Sawyer's answer to cross-question fifty-three, I have made a calculation as to the radiating surfaces of the carbon, whose size has been given by Mr. Man, and as to that of the carbon in my exhibit marked "Edison's Commercial In-467 candescent Lamp," and find that the candle power per unit surface is greater in my lamp at sixteen candles than in the lamp described by Mr. Man, giving thirty candles. In giving candle powers, the total radiating surface is the main factor which should be always given.

Had I the same radiating surface in my lamp, it would have given about thirty candles, and lasted just as long, theoretically. Practically, it would last longer, as the smaller and lighter the carbon the more difficult it is to manufacture it so perfect. To show how absurd it is to give candle power without the radiating surface, one might make a lamp that would give twenty-five candles when only brought up to a yellow heat. From my experience I should judge that the carbon made of the material and in the manner specified and used under the conditions specified, would last on an average about as long as was stated by Mr. Sawyer in his communication to the New York papers, about December 22d or 23d, 1879, that is, they would not last more than a few minutes. In fact, Mr. Sawyer stated in a communication to the N. Y. Sun, December 22d, 1879, which is now before me, and dated from 78 Walker street, December 21st, that a carbonized-paper lamp would not last three hours, and also stated that in practice it would not last twenty minutes in a perfect vacuum. Now, as Mr. Sawyer did not get anywhere near a perfect vacuum, and yet from his experiments predicated the statement that even in a perfect vacuum they would not last twenty minutes, the results obtained by Messrs. Sawyer & Man can be readily surmised. They were undoubtedly very dismal failures.

The article from the N. Y. Sun of December 22d, 1879, referred to in the foregoing answer, is put in testimony and marked Edison's Exhibit No. 8.

The exhibit is objected to upon the ground that there is no evidence that it was published in the N. Y. Sun, or that Mr. Sawyer wrote it. All reference made to the article in the witness' answer is objected to on the same ground. And upon the further ground that the article is not evidenced in any sense. 468

61 Q. Refer, if you please, to the descriptions given by the witnesses for Sawyer & Man and the sketches and drawings referred to by them in the printed record of Sawyer & Man's testimony, and taking into view the incandescent conductors employed, and the heat-radiators employed, and the other parts of the lamp, would such a lamp, in your opinion, be a practical lamp or not, giving reasons for whatever opinion you may express?

A. No, sir, it would not be a practical lamp. The testimony of even Messrs. Sawyer & Man, and the statements of Mr. Sawyer and his witnesses prove that it is not a practical lamp. No lamp has ever yet been devised up to the present date that was practical which had an inclosing chamber partially made of a cup of metal and secured to the glass by cements. In fact, Mr. Sawyer states the same in his patents, and shows many devices to obviate this defect. A sufficiently high vacuum cannot be obtained in chambers of this character to prevent oxidation and electric convection of the carbon. When the globe is filled with nitrogen, the atmospheric gases will still pass in, in the manner described by Graham in his experiments upon the transpiration and diffusion of gases. A great many inventors, including Messrs. Sawyer & Man, place their carbons in an atmosphere of nitrogen, on the theory that nitrogen is inert

towards carbon. It is well known that carbon at high incandescence combines with nitrogen to form cyanogen, and the cyanides due to ash of the carbon. My assistant, Dr. Moses, has obtained a chemical reaction for cyanogen compounds, formed by electrical incandescence of carbon in an atmosphere of nitrogen. To obviate the defects of an imperfectly sealed chamber, Messrs. Sawyer and Man introduce nitrogen gas, upon the theory that if the atmosphere in the globe is at the same atmospheric pressure as the exterior atmosphere, there will be no tendency of the oxygen of the exterior
469 atmosphere to pass within the globe, and that nitrogen is inert towards carbon. Both of these theories are wrong.

Another reason why the lamp would not be a practical lamp, is that the carbon in the lamp which Mr. Sawyer testifies was the perfected lamp, is not provided with thickened ends, whereby the incandescence of the carbon is reduced; hence it can only have its incandescence due to the passage of the current reduced by conduction of the heat away from the carbon at the point of contact. The carrying capacity and heat conductivity of these clamps are so small, compared to the size of the carbon, and the incandescence which it is necessary to bring the carbon up to, to give, say twenty candles, that the carbon at the points of contact would be partially incandescent, as the heat could not be conducted away fast enough, and a bad contact between the carbon and the clamps would necessarily follow, accompanied by small arcs, which would gradually increase and ultimately destroy the contact. The amount of energy lost by conduction would be far greater than that lost in the form of useful light. My assertions in this respect about the conduction of heat are verified by the construction of the lamp itself, where special means are employed in the way of radiators whereby the heat of conduction may be radiated so that the lamp will not get too hot. This energy is of course useless for light-giving purposes, and consumes nearly as much electricity as is required to produce a light of twenty candles in the carbon. The great heat also produces great differences of temperature in the inclosing case, and therefore difference in the expansion of portions of the case, which causes leakage from the atmosphere into the case. Another thing is, that if when the lamp is cold, the gases within it are at the same pressure as that of the atmosphere, this result will be changed when the lamp is lighted. The gas within the globe becomes expanded, and there is a different pressure, the tendency of which, if there is leakage, is to force the gas out of the lamp until the pressures are constant. If this takes place, and the lamp is allowed to cool, then the atmospheric pressure will be the
470 highest and there will be a tendency for the atmosphere to pass into the globe. For these and other reasons which could be mentioned the lamp which Mr. Sawyer calls his perfected lamp, is in my view entirely impractical, commercially, scientifically or otherwise.

I have previously stated the reasons why it would not be practical commercially in a previous part of my testimony. Its resistance would be too low to admit of practical subdivision, on account of the great investment required for copper conductors. It would not be sufficiently economical, on account of the energy lost by conduction and by convection through the residual gas.

Counsel for Edison gives notice that reserving the right to put in certain patents, the data of which he will procure, and exhibits of experiments in 1878, for which search is now being made during the course of this examination, he here rests his examination of Mr. Edison, and offers him for cross-examination. Counsel for Sawyer and Man gives notice that his cross-examination of the witness will be *de bene esse* as to all that part of the witness' testimony that is intended to show or goes to show that he made the invention previous to the date alleged in his preliminary statement, and that he does not intend that his cross-examination shall be construed as a waiver of any objection he may have entered of record, and that he will object and move to strike out, either before or at the hearing of the interference, any re-examination of the witness, or any testimony or exhibit put in that does not refer to new matter brought out in the cross-examination.

Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

62 X Q. In answer to question 1 of your examination-in-chief, you say you are an inventor by occupation. Please state what inventions you were working on in the summer of 1876? 471

A. I was working on telephones, acoustic electrical transmission, electric pens, multiple copying apparatus, duplicating ink, galvanic batteries, sextuplex telegraphs, duplex telegraph, manufacture of carbon articles, and other things which I cannot now remember.

63 X Q. How much of your time during the summer of 1876 were you engaged in working on telephones? I mean, what time in the summer did you begin to work on telephones, and what time did you leave off?

A. I commenced to work on telephones in 1875. I have never left off since that date.

64 X Q. How much of your time was given to telephones during the summer of 1876?

A. It would be a difficult matter to divide my time up between all the things I was working on. I should say one-tenth of my time was given to speaking telephones.

65 X Q. Were you working in the summer of 1876 at one and the same time, or during the same period of time, upon all the inventions you mentioned in answer to 62 X Q.?

A. Yes, sir; I think I was.

66 X Q. Was there any exigency in the development of either of the inventions referred to by you that moved you to carbonize paper?

A. I have stated that one of the things I was working on was the carbonization of paper to form different articles. One of my assistants, Mr. Johnson, had formed or was about to form a company called the American Novelty Company, whose purpose was to work off some of the small inventions which I was making. The manufacture of a great many articles from carbon was one of these inventions. Among other things was an electrical sheepshearing machine, an electrical drill, an electrical engraving machine, ribbon mucilage, and other inventions which I cannot now remember. They were small things. I think he had a list of about twenty.

472 67 X Q. What articles did you propose to manufacture of carbonized paper?

A. Battery carbons, strips of carbon for electrical resistances, dishes for use in making chemical reactions, and tissue paper as a non-conducting packing.

68 X Q. How many of these articles did you make?

A. We made four or five crucibles, a great many flat sheets, and a half a pound to a pound of carbonized tissue paper.

69 X Q. How long did you continue to work at your experiments in the manufacture of articles of carbonized paper, in the summer of 1876?

A. I should say we tried experiments on and off for perhaps two months.

70 X Q. Please to state when you began your experiments and when you discontinued them, as near as you can recollect.

A. As near as I can recollect it was in the summer of 1876.

71 X Q. Can't you state at what time in the summer of 1876 you commenced your experiments, and at what time you discontinued them?

A. I should judge that it was about June or July, 1876.

72 X Q. State, if you please, when it was that you next took up the subject of carbonizing paper.

A. I think about January, 1877.

73 X Q. What circumstances moved you to return to the carbonization of paper in January, 1877?

A. Using it in a telephone.

74 X Q. How long did you continue to use carbonized paper in your telephone?

A. I think I used it as late as January or February, 1878; perhaps later. All my exhibits are in the telephone interferences, and I have nothing here to refresh my memory.

75 X Q. For what other purpose did you use carbonized paper in January, 1877?

A. I used it for resistances.

76 X Q. After January, 1877, did you discontinue the carbonization of paper?

473 A. No, sir. I think we carbonized paper when we wanted it, although we generally had plenty of it around the laboratory If none of it suited our purpose, we generally carbonized what we required.

77 X Q. Why did you use carbon made of paper in — telephone and in your battery, in preference to *your* carbon made of anything else?

A. Because it was in convenient form. We could get it in all the forms we wanted it. We also carbonized wood of various kinds, as well as paper.

78 X Q. Had the carbon made of paper no other superiority for the purpose for which you wanted it beyond that of mere convenience in manufacture?

A. In our telephones we had to have it in a great many experiments very thin. Hence paper was the most convenient material to use. For nearly all the purposes for which we used carbon, it was the most convenient material. In our telephone experiments we used every kind and character of carbon, and every form and shape. In 1877 most all our thoughts were on carbon and plumbago. It was carbon from Monday morning to Saturday night, month in and month out, and always in connection with its interpolation in an electric circuit.

79 X Q. When did you turn your attention to the subject of electric lighting?

A. In September or October, 1877.

80 X Q. Please to describe the first electric lamp you made or caused to be made.

A. I think my first experiments were with heating platinum wires to incandescence. Afterwards heating carbon paper up to incandescence in the atmosphere. Also, coating the carbon with powdered glass, which, in melting was to protect it from the atmosphere.

Also with powdered silicon. Also in the lamp marked "Edison's First Incandescent Lamp." Afterwards by the passage of current through pieces of boron and silicon, rendering them incandescent. Also silicon and boron placed between carbon points. All
474 these experiments, I believe, were conducted between September, 1877, and January, 1878.

81 X Q. You do not answer my question, which is repeated.

A. The first carbon electric lamp, if it may be called an electric lamp, was a piece of carbonized paper, about an inch long, one-sixteenth of an inch broad, and six or seven thousandths of an inch thick, the ends of which were secured to clamps, which clamps formed the poles of a battery. The carbon was brought up to incandescence, and of course oxydized immediately. That was one of the '77 experiments. The first lamp in vacuo, if it may be called a lamp, was Edison's Exhibit First Incandescent Lamp. This consists, as will be seen, of two clamps, forming the poles, between which a strip of carbonized paper was placed and secured by clamping. The base of the lamp being placed over the mouth of the hole on the platen of the air-pump, had the air exhausted from the globe as far as possible by our air-pump, and the carbon brought up to incandescence after the air due to the first heating had been pumped out.

82 X Q. Did your first experiment in electric lighting consist of a section of carbon made of paper placed in an electric circuit in the open atmosphere, to which you applied a current and burnt up the carbon?

A. I have already stated that I first tried platinum, but we will leave this out of consideration, and my answer will be yes. It was a mere experiment with the carbon in open air. I knew beforehand what it would do. It was to ascertain, I think, the amount of current required to bring it to incandescence.

83 X Q. When was that experiment made? State the date, as near as possible.

A. It might have been in September or in October, 1877.

84 X Q. Was it surely in one or the other of those months?

A. I am not absolutely sure, but my impression is it was in either one of those months.

475 85 X Q. You are certain that it was in the year 1877?

A. Yes, sir; I know it from my Exhibits Nos. 4 and 5.

86 X Q. Was that the first attempt that you made to use carbon made of paper in electric lighting?

A. The first premeditated attempt to use paper for lighting by incandescence. I have stated that one of our objects in 1876 was to make carbons for electric lighting, but not by incandescence.

87 X Q. When did you make your next attempt to use carbon made of paper in incandescent electric lighting?

A. In September, October or November, 1878. I should say October is the month we started to make paper carbons.

88 X Q. You say that your first premeditated attempt at using carbon made of paper for incandescent electric lighting was in September or October, 1877, when you placed a piece of carbonized paper in circuit in the open air, for the purpose of ascertaining the amount of current to make it incandescent. And that your next attempt was in the fall of 1878. Now please to state whether this second attempt embraced the Exhibit "Edison's First Incandescent Lamp."

Question objected to by counsel for Edison as containing a misstatement of the witness' testimony.

A. My second attempt was not in the fall of 1878. I have already stated in my testimony that my first attempt at making an incandescent carbon lamp, if it can be called a lamp, was made in September or October, 1877, and consisted in bringing a strip of carbonized paper up to incandescence in the air. And my next attempt to make an incandescent lamp with carbon paper, if it may be called a lamp, was that shown in Edison's Exhibit First Incandescent Electric Lamp, which was also made in 1877, within a day
or two of the first experiment. The attempts made at coat-
476 ing the paper with glass and silicon are not taken into con-
sideration in this answer.

89 X Q. Then, as I understand you, your first and second attempts at electric lighting with carbon made of paper were made either in the month of September or October, 1877, the second attempt being made within a few days of the first?

A. Yes, sir; lighting by incandescence of carbon paper.

90 X Q. The first attempt was the use of the carbonized paper in

the open air, and the second embraced the lamp marked "Edison's Exhibit First Incandescent Lamp"?

A. Yes, sir.

91 X Q. Do you fix the times at which these attempts were made by the Exhibits Edison No. 4 and Edison No. 5?

A. Yes, sir; these exhibits refresh my memory, as to experiments conducted at that time, and previous thereto.

92 X Q. What is there upon Exhibit No. 4 that calls your attention to any experiment made in electric lighting by incandescence with carbonized paper?

A. The exhibit merely refreshes my memory so as to enable me to state the date of the time when I did try experiments with carbonized paper. The exhibit is headed "electric light," and explains itself.

93 X Q. Do you find anything on the exhibit that makes any reference to electric lighting by indandescence with carbonized paper?

A. No, sir; I do not. I have already stated that the exhibit serves only to refresh my memory as to the date. The reason why boron and silicon were used is that they are not so sensitive to oxidation as the paper previously tried.

The last part of the answer is objected to by counsel for Sawyer & Man as irresponsive.

94 X Q. In whose handwriting is Exhibit No. 4?

A. Most of it is in my own handwriting.

477 95 X Q. There is a strip of Exhibit No. 4 torn out between the names of Mr. Charles Batchelor and J. Kruesi. Who tore that out?

A. I do not know. Those papers were originally in books, and the books were all destroyed, and the sheets forming the same numbered and bundled together. The most of them were used as exhibits in my telephone interference.

96 X Q. Was there any one else's signature written upon this paper between the names of Charles Batchelor and J. Kruesi?

A. I do not know. I do not think so. It looks as if it had been stuck on a paper file and torn off.

97 X Q. Who made the diagrams upon this paper Exhibit No. 4?

A. I did.

98 X Q. When were the diagrams and writing made upon this paper—so much of them as was made by you?

A. At the date stated thereon.

99 X Q. There are two dates on the paper. Which date do you mean—the date on the right-hand corner at the top, under which your name is signed?

A. I refer to the date November 1st, 1877.

100 X Q. There is a memoranda at the bottom of the paper as follows: "Copied in volume No. 1, experimental researches, page 115, September 28, 1878." Signed William Carman. Who is William Carman?

A. He was at that time, and is now, my book-keeper at Menlo Park.

101 X Q. Does that memoranda show the correct date of the record of this paper?

A. It shows the date when it was recorded in the book, as set forth.

102 X Q. Why was it not recorded until September 28th, 1878?

A. Because about that date we commenced collecting all the scraps and memoranda relating to experiments together, for the purpose of preserving them, and especially those relating to telephones, of which there were several thousand, now used as exhibits in the interferences on telephones.

478 103 X Q. Have you got that book in which this paper is recorded, and, if so, will you produce it for my examination?

A. I have it at Menlo park, I think. I will have it brought in.

104 X Q. It appears by this paper that some time previous to November 1st, 1877, you had "tried boron, ruthenium, chromium, and the almost infusible metals for separators in my electric-light device. Boron is very high resistance, and would do if arranged thus." Then follows a diagram. It is then stated that "cilicium, on the other hand, is of very low resistance, and would have to be arranged thus." Then follows another diagram. Then follows these words: "I think powdered silicium, mixed with lime or other very infusible non-conductors or semi-conductors, would be good." Now, if previous to the making of this paper by you, you had attempted the use of carbonized paper for incandescent electric lighting, how did it happen that you didn't mention it on this paper with the other substances or materials referred to by the paper?

A. Because I had got done with my experiments on carbonized paper. The results were so unsatisfactory, even when the carbonized paper was in the vacuum which we obtained. Its sensitiveness to oxidation was one of the factors which led me to try experiments on silicon and boron, which were not so sensitive to oxidation. I thought that as we could not get carbon to stand, that these non-oxidizable materials might be made to stand. I have had pieces of silicon, separating the two electrodes, incandescent for an hour at a time. Had the carbon experiments been as satisfactory, I would undoubted- be able to present an exhibit in which some of them would be recorded.

104½ X Q. Do the experiments referred to by this paper, Exhibit No. 4, make part of your efforts at electric lighting by incandescence?

A. Yes, sir; as well as my Exhibit No. 5.

105 X Q. Did you, at the time referred to by this paper, keep written memoranda of all your attemps at electric lighting?

479 A. No, sir; I do not think I did.

106 X Q. Did you keep a written memoranda of all the experiments that yielded results of any value?

A. No, sir; I do not think I did. The exhibits themselves state that I tried experiments, and yet I have no record of them.

107 X Q. What is there in the paper, Exhibit No. 4, that satisfies your mind, that your first and second attempt at electric lighting by incandescence with carbonized paper was previous to the date of the paper?

A. It refreshes my memory as to the fact that I was trying experiments on electric lighting by incandescence, and it permits me to remember that my first experiments were with platinum and carbonized paper.

108 X Q. Then, as I understand you, you know certainly by this paper, that the experiments noted on it were made on or before its date, which is November 1st, 1877, and to the best of your recollection, the experiments with the carbonized paper embraced in your first and second attempt at electric lighting by incandescence, were made previous to the date of the experiments noted on that paper?

A. Yes, sir; that allows me to fix the date.

109 X Q. Did Mr. Charles Batchelor and Mr. J. Kruesi sign their names upon this paper in your presence at the time the paper was made?

A. I cannot say; our habit was to have the papers witnessed within a day or two of the date placed upon them.

110 X Q. Please to mark the diagrams on this paper, Exhibit 4, figures 1 and 2 respectively?

A. I have done so, as requested.

111 X Q. Does Fig. 1 of these diagrams represent a number of lamps set in multiple arc, and if so, please to designate the lamps by letter *a*?

A. It does so represent, and I have designated them by letters a, a^1, a^2, a^3.

112 X Q. State, if you please, whether figure 2 represents lamps set in series, and if so, please designate the lamps by letter *b*?

480 A. It does so represent, and I have designated the lamps b, b^1, b^2.

113 X Q. The word "magneto," as I understand it, written by the two diagrams, is intended to designate an electric generator?

A. Yes, sir.

114 X Q. Who is Mr. Charles Batchelor?

A. He is one of my assistants.

115 X Q. How long has he been in your employ?

A. About ten (10) years.

116 X Q. Who is Mr. J. Kruesi?

A. A machinist in my employ.

117 X Q. How long has he been in your employ?

A. I think about (7) years.

118 X Q. In whose handwriting is Exhibit Edison No. 5?

A. Nearly all in my handwriting.

119 X Q. When was it made?

A. On the day of its date, that is, December 3d, 1877.

120 X Q. Was this paper, Exhibit No. 5, witnessed by Charles Batchelor, M. N. Force, and J. Kruesi in your presence?

A. I cannot say.

121 X Q. Do you know the signatures of those gentlemen?

A. Yes, sir.

122 X Q. Can you swear that their signatures are signed upon this paper?

A. Yes, sir.

123 X Q. Can you swear when the signatures were made?

A. No, sir; but my impression is, they were made within a day or two after the date on the paper; that was our habit.

124 X Q. And this paper, Exhibit No. 5, assures you that the experiments noted on it were made on or before the day of its date, and that to the best of your recollection, your first and second attempt at electric lighting with carbonized paper was made before the date of that paper?

481 A. I have already testified that it was made before the date of Exhibit No. 4, which is an earlier date than Exhibit No. 5.

125 X Q. Does either Exhibit No. 4 or No. 5 make any reference to your experiment with carbonized paper in electric lighting?

A. No, sir; they merely refresh my recollection as to dates.

126 X Q. Who made Edison Exhibit First Incandescent Lamp?

A. I don't know; we bought it. It was a well-known school apparatus for illustrating the electric brush *in vacuo*. The changes necessary to try the experiment on carbonized paper were made by or through the orders of Mr. Charles Batchelor.

127 X Q. Did you buy the lamp yourself?

A. I do not know, I cannot remember, but my impression is I did.

128 X Q. Where did you buy it?

A. I cannot remember that, but my impression is I bought it of a firm called Luhme & Co.

129 X Q. Where?

A. New York.

130 X Q. Give the street and number in New York?

A. I don't know the street or number. It was down near the post office.

131 X Q. Do you recollect what you paid for it?

A. No, sir.

132 X Q. Was the place at which you purchased it, north or south of the post office?

A. It was south of Chamber- street and north of Vesey street.

133 X Q. Was it west of Broadway?

A. And west of Broadway.

134 X Q. Is that as near as you can locate the place where you purchased the lamp?

A. Yes, sir.

135 X Q. Have you now a distinct recollection that you did purchase the lamp yourself?

A. No, sir; I have only an impression.

482 136 X Q. Who do you think would have purchased it if you did not?

A. It might have been purchased by letter or by messenger boy.

137 X Q. You are sure it was purchased of the firm of Luhme & Co., in the city of New York?

A. No, sir; I am not; but my impression is that it was.

138 X Q. Were you in the habit of dealing with that firm?

A. I was in the habit of dealing with that firm, and a firm named Benjamin & Co., I think.

139 X Q. Where is the firm of Benjamin & Co.?

A. I think it was somewhere south of Chambers, north of Vesey, and west of Broadway.

140 X Q. What does Luhme & Co. deal in, and what does Benjamin & Co. deal in?

A. In philosophical apparatus.

141 X Q. This lamp, Edison Exhibit First Incandescent Lamp, that you say you think you purchased, what was the name of the apparatus when you purchased it?

A. My impression is, it is called a "Gassiot cascade."

142 X Q. What alterations did you make in this cascade to adapt it to your purpose in making your experiments in incandescing electric lighting with carbonized paper?

A. Clamps were placed in it to hold the carbon, and binding posts outside to hold the conducting wires.

143 X Q. How many experiments did you try with this lamp?

A. My impression is that we tried two or three experiments.

144 X Q. How large was the piece of carbonized paper which you used in this lamp? Give the length, the breadth and the thickness of it.

A. My impression is that it was about an inch long, $\frac{3}{16}$ broad, and I think somewhere less in width than $\frac{3}{16}$; I should say they were eight-thousandths of an inch thick.

483 145 X Q. Did you carbonize the paper especially for these experiments?

A. I do not remember whether we used some carbonized paper we had on hand, or carbonized it expressly for the occasion.

146 X Q. How did you get the carbonized paper in the lamp?

A. Mr. Batchelor put it in.

147 X Q. You don't know how he got it in?

A. No, sir; I don't.

148 X Q. What degree of vacuum did you get in this lamp?

A. My impression is we got two and half millimeters of mercury on a gauge, which represents, if the gauge was correct, that the column of mercury was within two and a half millimeters of a perfect vacuum.

149 X Q. How much is a millimeter in inches?

A. It isn't an inch; two and a half millimeters are about a tenth of an inch.

150 X Q. What was the resistance of the carbonized-paper burner that you used in this lamp?

A. I did not measure it.

151 X Q. What strength of current did you have on it?

A. We had about 50 cells of carbon battery, but I do not remember how many we used on it.

152 X Q. Did you get the carbonized paper to brilliant incandescence?

A. No, I do not think so.

153 X Q. How long did the carbonized paper last in the lamp?

A. My impression is that it only lasted six or eight minutes.

154 X Q. How long was you engaged upon these experiments with this lamp?

A. I do not think more than a day.

155 X Q. Were they made at your laboratory, Menlo park?

A. Yes, sir.

156 X Q. How did you exhaust the air out of the lamp?

484 A. By an air-pump.

157 X Q. Was it a pump you had on hand, or did you buy it for the occasion?

A. A pump I had on hand.

158 X Q. Did you prepare the lamp for the experiment yourself, or did Mr. Batchelor prepare it?

A. Mr. Batchelor.

159 X Q. Did you see Mr. Batchelor put in the paper carbons?

A. I don't remember it.

160 X Q. How do you know that paper carbons were actually put in the lamp?

A. Because I told him to put them in, and I saw them after they were in.

161 X Q. How could you distinguish a carbon made of paper from any other carbon?

A. Very easily, by its looks.

162 X Q. How does it differ in appearance from carbon made of wood?

A. It is very difficult to describe the difference in appearance, still, when once a person has seen the two, he can distinguish them readily. The fibres of the paper are still visible after carbonization, while the wood shows the cellular formation.

163 X Q. Why did you not continue your experiments upon the use of carbonized paper for incandescent electric lighting in this lamp?

A. Because the results didn't warrant it.

164 X Q. Upon the conclusion of your experiments with this lamp, did you abandon the attempt at electric lighting by incandescence with carbonized paper?

A. No, sir; we laid it aside and took up what we thought at the time was more promising—the use of silicon and boron for incandescent lighting.

165 X Q. State, if you please, whether the paper marked Edison Exhibit No. 1 is an illustration of your first attempt at electric lighting by incandescence, with carbonized paper, in the fall of 1877, about which you been testifying.

A. No, sir; it is an illustration of experiments conducted in the fall of 1878.

485 166 X Q. In answer to question 9 of your examination-in-chief, which is as follows (counsel reads question and answer

to witness), state, if you please, whether in that answer you referred to Edison Exhibit First Incandescent Lamp, which you subsequently produced.

A. Yes, sir.

167 X Q. Then, as I understand you, the attempt illustrated by Edison Exhibit No. 1, followed the attempt embraced in Edison Exhibit First Incandescent Lamp; the latter being made in September or October of 1877, and the former in October or November of 1878? I mean, of course, in incandescent electric lighting with carbonized paper.

A. Yes; this Exhibit No. 1 is an illustration of experiments conducted in September or October, 1878, with incandescence of carbonized paper.

168 X Q. Then this paper, Exhibit No. 1, as I understand you, represents your third attempt at incandescent electric lighting with carbonized paper?

A. No, sir; it represents the second in point of date. My understanding of "attempt" at incandescent lighting is, that it means all those experiments made within a few days of each other, forming a group. The experiments in 1877 are my first attempt, those in 1878 my second attempt, and those in 1879 my third attempt.

169 X Q. Well, then, referring to Edison Exhibit No. 1, as your second attempt, please to state whether the exhibit is intended to represent the whole or a part of an experiment with carbonized paper in incandescent lighting in vacuum.

A. They represent a few of the experiments tried at that time on the incandescence of carbonized paper, but not *in vacuo*.

170 X Q. Please to describe the first electric lamp or apparatus in which you used carbonized paper for incandescent electric lighting *in vacuo*, in October or November of 1878?

A. My impression is that it consisted of a piece of carbon-
486 ized paper coated with tar and lamp-black, and carbonized,
placed in clamps connected to the circuit, and placed under
the bell jar of the vacuum pump. I am not absolutely sure that this experiment was tried in September or October, but it was tried not later than December, 1878.

171 X Q. What do you mean by the "bell-jar" of the vacuum pump?

A. The bell-jar that usually accompanies vacuum pumps, in which the vacuum is obtained.

172 X Q. Was the bell-jar of glass?

A. Yes, sir.

173 X Q. Please to illustrate the arrangement, and describe it by letters of reference?

A. This sketch represents the arrangement as I recollect it. A represents the platen and bell-jar of the vacuum pump; B is the bell-jar, *c* is the platen, *d* and *e* are binding posts; *f* and *g* of figure 2 are metal pieces, connected through the iron of the platen to the binding posts; *h* and *k* are insulating pieces; *m* and *n* are metallic prongs which fit against these metallic pieces *f* and *g* when pressed down on their sides. This connects the circuit with *m* and *n*. The electrode *p* holding the carbon is connected to *n*, while the other electrode connecting the other end of the carbon and marked Q is connected by a wire with *m*. Thus the circuit was complete from one binding post to the other through the carbon when the bell-jar was on. The bell-jar represents the vacuum chamber of the pump in which the light was produced.

This sketch is put in evidence by counsel for Sawyer and Man as an illustration of the witness' testimony, and marked Edison Exhibit No. 9.

174 X Q. How many experiments did you make with carbonized paper in the vacuum chamber of this pump as you have described?

A. My impression is that we made three or four experiments.

487 175 X Q. Were the experiments made by you personally or in your presence?

A. I think they were made by myself and Mr. Batchelor, and perhaps Mr. Upton.

176 X Q. Who prepared the pump for the experiments?

A. I don't remember.

177 X Q. Did you witness the experiments yourself?

A. I witnessed some of them.

178 X Q. Did you see the carbonized paper put in the vacuum chamber?

A. I saw it in the chamber. I don't remember seeing it put in.

179 X Q. Are you able to swear, of your own knowledge, that the carbon in the vacuum chamber was made of paper?

A. Yes, sir; some were made of paper, and some of carbonized broom corn.

180 X Q. Were the papers carbonized expressly for the experiment?

A. I think they were carbonized for the experiment shown in Exhibit 1, and had been carbonized previous to this last experiment.

181 X Q. Do you mean that they were carbonized expressly for those experiments which you say were made in October or November, of 1878, and were they carbonized at the time of the making of those experiments?

A. Mr. Batchelor, I believe, had made fifty or more of these carbons for experiments in September or October, 1878, some of which are illustrated as used in Exhibit No. 1.

182 X Q. What size were the carbons used in the experiments made with the pump?

A. My impression is that they were about one thirty-second in diameter, and an inch or two inches in length.

183 X Q. Was the carbon that you used in Edison Exhibit First Incandescent Lamp, straight or curved?

A. Straight.

488 184 X Q. What was the success of your experiment with carbon in the vacuum chamber of the pump?

A. We could not make the carbon stand, although we had pieces of potassium, and also sodium, within the chamber.

185 X Q. What was the resistance of the burner?

A. We didn't measure it.

186 X Q. What was the strength of the current?

A. I think the strength of the current was four or five vebers, or four or five thousand foot pounds.

187 X Q. What degree of vacuum did you have upon the burner?

A. I think about $2\frac{1}{2}$ or 3 millimeters, which we read off from a mercury gauge which came with the pump, and was the best vacuum generally obtainable with a pump.

188 X Q. Please to describe the next lamp you made, if any, in October or November of 1878, in which you used carbonized paper for incandescent lighting in a vacuum.

A. I don't think we tried any other experiments than the ones I have here recited *in vacuo*, in 1878.

189 X Q. That, then, as I understand you, completes what you call your second attempt at electric lighting by incandescence with carbonized paper?

A. That, and including the devices illustrated in Exhibit No. 1, and patent No. 224,329, this arrangement being similar to that shown in Mr. Sawyer's patent 219,771, dated September 16th, 1879.

190 X Q. Do you wish to be understood as saying that you made a lamp in the fall of 1878 like that shown and described substantially in patent 224,329, dated February 10th, 1880, and used carbonized paper in it for incandescent electric lighting?

A. Yes, sir; we used carbonized paper and carbonized broom corn in it in September, October or November, 1878.

191 X Q. Does the specification making part of that patent, make any reference to the use of carbon made of paper?

A. No, sir; it does not; it merely mentions carbon, and does not mention the kind of carbon.

489 192 X Q. Why did you not describe in that specification the use of carbon made of paper in that lamp?

A. Because that was not part of the invention. We made these slender pencils of carbon, because it was the easiest way to make carbon, as we had no mill for grinding carbon or mold for molding it, and hence made the pencils in the most convenient way, such as coating paper with tar and rolling it up and carbonizing it, and also by carbonizing broom corn.

193 X Q. Did you make and use an electric lamp like that of the patent last referred to in the fall of 1878?

A. Yes, sir.

194 X Q. Then, in addition to the experiments made with the paper carbons in the vacuum chambers of the pump in the fall of 1878, you also experimented with the same kind of carbons in the lamp of the patent 224,329, as I understand you?

A. Yes, sir.

195 X Q. Were the experiments with the lamp of the patent referred to made *in vacuo?*

A. No, sir; they were made in the open air, and were to obviate the use of a vacuum.

196 X Q. At the time you experimented with this lamp of the patent referred to, had you discovered the superiority of carbon made of paper for incandescent electric lighting over other carbon?

A. No; only it was very convenient material to use.

The witness desires to add to his answer the following:

My answer is changed to this: No; only it was very convenient material to use, and was organic carbon.

197 X Q. Referring now to Edison's commercial incandescent electric lamp, state when it was that you first made a lamp of the form and substance of this exhibit.

A. I think duplicates of this lamp, as to form, shape and material, were made some time in October, 1879.

198 X Q. Have you got the original lamp of the form of this exhibit?

A. I have not been able to find it within the last two or three days, but my impression is that I can produce one of the first six made.

199 X Q. Was the first one of the same size that this exhibit is?

A. The globe was about the same size. It was made in the same manner, except that the paper, which was parchmentized paper, was wider than it was thick, and was bent over in the form of an arch.

200 X Q. Were the metal conductors put in in the same way they are put in this exhibit?

A. Yes, sir.

201 X Q. Was there a section of platinum interposed in the conductor between the copper and the carbon?

A. Yes, sir.

202 X Q. And the interior glass bulb was contained in it the same as in this one, was it, and the lamp sealed in the same way?

A. Yes, sir.

203 X Q. Please to give the dimensions of the carbons used in those first lamps like this exhibit.

A. The first lamp of this peculiar character with paper carbon had a carbon about a thirty-second of an inch wide, six or eight thousandths of an inch thick, and about two inches and a half to three inches in length before carbonization. It was cut straight and had thickened ends, and was bent in the form of an arch before carbonization. After being put in the lamp, the height of the arch, I should judge, was about an inch or an inch and an eighth. Within a day or two afterwards we cut loops out of paper of the form desired, the same as shown in my Exhibit Commercial Incandescent Electric Lamp, and the same as shown and described in my application in this interference.

204 X Q. Referring still to the first lamps like this exhibit, state, if you please, what resistance the carbon had in those lamps?

A. The rssistance of a unit length and mass of paper carbon is generally the same, whether the lamp has one ohm or a thousand

ohms resistance. The resistance of the whole carbon probably was
a hundred and twenty-five ohms cold, and perhaps seventy-
491 five ohms at sixteen candles. Carbon decreases its resist-
ance when heated, but not in direct proportion to the rise of
temperature. I do not think we measured the resistance of the
carbon in the first lamp, but only judged it.

205 X Q. To what degree of perfection did you get the vacuum in the first lamps like this Exhibit Edison's Commercial Lamp?

A. My impression is that they were exhausted to the one-millionth of an atmosphere.

206 X Q. To what degree of luminosity did you raise the carbon?

A. I think we raised it as high as 30 or 40 candles.

207 X Q. How long did it last, raised up to that degree of luminosity?

A. We did not keep it for more than half an hour at that degree of luminosity. My impression is that at from 12 to 16 candles it lasted over a hundred hours.

208 X Q. Of continuous illumination?

A. Of continuous illumination; yes, sir.

209 X Q. Referring now to this particular lamp, Edison's Exhibit Commercial Incandescent Lamp, you say in answer to Q. 33, examination-in-chief, that it burnt either 70 hours and 18 minutes, or 250 hours and 40 minutes. Can't you state any more definitely than that the time that the lamp did actually burn?

A. No, sir, I cannot. In my book, in which is recorded the life of 150 or more lamps, I find that the record of the life of this lamp is put down in ink as 251 hours and 41 minutes; but this has been partially scratched off, and 70 hours and 18 minutes substituted.

210 X Q. And you cannot tell which is the correct data, as I understand you?

A. No, sir

211 X Q. Please to read from your record book all the memoranda
and data you have in writing that refers to this particular lamp—
Edison's Exhibit Commercial Incandescent Lamp?
492 A. I think I have other records of this lamp, and will try
and find them. I read now from the book referred to,
page 39:

"Street lamp top of stairs, right hand, 235.

Resist. —— January 2d, noon. Burnt .40. January 3d, 19.30; Jan'y 4th, 9.58; Jan'y 5th, 20.50; Jan'y 5th, 3.47;

6, 20.26; 7, 12.15; 8, 22; 9, 9; 9, 6.50; 10, 19.15; 11, 7; 12, 11. Total time burnt, 70.18. Carbon bu-sted.

Total time burned 207.36 up to 5 p. m.

251.41 up to noon."

A portion of the record is scratched out.

212 X Q. Please to permit me to examine the record from which you have read in answer to the last question.

(Witness hands the record to the counsel.)

213 X Q. Does this record show the resistance of the lamp?

A. No, sir.

214 X Q. Does it show the luminosity of the lamp?

A. No, sir.

215 X Q. Does it show the degree of vacuum in the illuminating chamber?

A. No, sir.

216 X Q. Does it show when the record was made?

A. It shows that it was January 2d, at noon, but does not state the year; but on page 38, one page before this record, lamp 153, a date, January 2d, 1880, is recorded, and I know that this was in 1880. Lamp 153 had a resistance of 132 ohms, and lasted over 200 hours.

Last part of answer objected to by counsel for Sawyer & Man as irresponsive and impertinent, as no inquiry is being made about the record of lamp 153.

217 X Q. Can you swear that this record you have quoted was made January 2d, 1880?

A. I can swear it was made within four or five days of that date. I think I shall be able to produce a witness who made these records. 493

218 X Q. In whose handwriting is this record you have quoted?

A. In Mr. Batchelor's handwriting, and Mr. Herrick's, I think.

219 X Q. Which of it is in Mr. Charles Batchelor's handwriting, and which of it is in Mr. Herrick's handwriting?

A. The words "street lamp, top of stair, right hand. Resist. Burnt 40," are in Mr. Charles Batchelor's handwriting, and all the rest is, I think, in Mr. Herrick's handwriting.

220 X Q. How does it happen that the date of the record is January 2, noon, and the burning of the lamp appears to have commenced on January 3d, and continued down to January 12th, taking the whole of the dates into account, including those that are crossed out?

A. It could not have commenced on January 3d, because the record states that up to January 3d it had burned 19.30, which means 19 hours and 30 minutes from January 2d; it had also burned 40 hours before January 2d.

221 X Q. Apart from this record, have you any distinct recollection of the burning of this lamp?

A. I have an indistinct recollection. It would be a hard matter to recollect any particular lamp out of a hundred nearly all alike. Upon the lamp it is marked "depot," and I remember it there. It was in a very conspicuous place and must have been seen by many thousand people.

222 X Q. You did not make this record yourself, as I understand you, and did not see it made.

A. I did not make it myself. I don't remember that I saw it made: but I remember that I watched these records pretty closely, and must have seen it within a day or so after it was made.

223 X Q. How does it happen that the whole record was not made by one person?

A. I think because Mr. Batchelor started the record, and
494 then got an assistant to carry it out more in detail. He will doubtless be able to testify on that subject.

224 X Q. Are you able to swear that the record was made as it appears here, all at one time, and that that time was during the performance of the lamp that is noted here?

A. I am able to swear that I believe it to have been made in the manner and on the dates set forth in the record.

255 X Q. Is part of the record in lead pencil and part of it in ink?

A. Yes, sir.

226 X Q. Please to state what part is in lead pencil?

A. Figures "235, street lamp, top of stairs, right hand. Resist. Burnt 40. Jan'y 2, noon, 70.18;" and some cross pencil marks.

227 X Q. Please to state what part of the record remains intact—that is not crossed out?

A. "235, street lamp, top of stairs, right hand. Resist. Burnt 40. Jan'y 3d, 19.30; 4, 9.58; 5, 20.50. Total time burned: 70.18; Jan'y 2, noon."

228 X Q. Is the rest of the record crossed out with ink and lead pencil?

A. Yes, sir.

229 X Q. Who crossed it out, and when was it done?

A. I don't know who did it, or when it was done.

230 X Q. Now, this lamp, Edison's Exhibit Commercial Lamp, and those few that preceded it, about which you have testified this morning, embrace, as I understand you, your third attempt at electric lighting by incandescence, with carbonized paper?

A. I testified regarding a few, but there were more than a hundred made by the end of December, 1879, all of this character, with carbonized paper. These constitute my third attempt in connection with all that I have done since.

231 X Q. What I want to know, Mr. Edison, is whether this lamp and all the lamps that you made having the form and substance of this lamp: "Edison's Exhibit Commercial Incan-
495 descent Lamp," embraced your third attempt at electric lighting by incandescence, with carbonized paper?

A. In October we commenced making lamps of the same character as to form, with paper carbon, as shown in Exhibit Edison's Commercial Incandescent Lamp, and have continued to make them ever since. This is my third and successful attempt at lighting by the incandescence of carbon made from paper.

232 X Q. Do you mean to swear, now, that your first and second attempts at electric lighting by incandescence with carbonized paper, were successful?

A. The first attempt I did not consider successful, except that it showed that if carbon could be made to stand, that it could be made successful; and my second attempt was successful in the form shown in patent No. 224,329, but *in vacuo* it was not successful, except that it proved that carbon from paper or organic material, would be a success for lighting by incandescence, if it could be made to stand.

233 X Q. How long did you use the lamp of patent 224,329?

A. My impression is, that we used it several days.

234 X Q. Have you got any memoranda in writing of its performance?

A. I do not think I have, that is dated.

235 X Q. Have you got any written record that you can swear represents the performance of this lamp?

A. I think among my records I may have something, but in hunting I neglected generally those records that have no dates.

236 X Q. How much of the time did you use this lamp with carbonized paper?

A. I should say carbonized paper was used in it on and off several hours, burning. In this lamp we used both carbonized broom corn and carbonized paper.

236½ X Q. Is the illuminating portion of this lamp intended to be inclosed in a glass chamber?

A. Yes, sir, partially of glass.

237 X Q. Between the time that you discontinued your experiments in the electric lighting by incandescence with carbonized paper, in the fall of 1877, and the time you commenced 496 to experiment again upon the same subject in the fall of 1878, as you have testified, was you engaged any of the time in experimenting upon electric lighting by incandescence?

A. My impression is that I did try some experiments in electric lighting by incandescence, but I can find no record to refresh my memory.

238 X Q. If you have any distinct recollection of any experiments made within the period mentioned in my last question, please to describe them?

A. I only have an impression.

239 X Q. You can't describe any experiments?

A. No.

240 X Q. Now, between the time that you discontinued your experiments in incandescent electric lighting with carbonized paper in the fall of 1878, and the time you commenced them again with carbonized paper in the fall of 1879, did you make any experiments in electric lighting by incandescence?

A. Yes.

241 X Q. What substance or material did you use for the illuminating portion of your lamp in such experiments?

A. Platina and other materials.

242 X Q. How much of the time embraced within my question (240 X Q.) were you engaged in experimenting with plantinum and material other than carbon?

A. Except perhaps some experiments with carbon, in January, 1879, we were engaged night and day between the times named.

243 X Q. During the period included in my X Q. 240, how many experiments did you make in incandescent electric lighting with carbon that was not made of paper?

A. I don't remember any experiment made with carbon that was not made with carbon paper or carbonized broom corn.

244 X Q. What experiments did you make with carbon made of paper in January, 1879?

A. In some form of lamp analogous to that shown in patent 224,329.

497 245 X Q. Please to describe the lamp in which you employed carbon made from paper for incandescent lighting in January, 1879.

A. It was a lamp similar to Fig. 2 in the patent 224,329.

246 X Q. How did it differ from the lamp described in the patent mentioned in your last answer?

A. I think the carbon was shoved down by a spiral spring.

247 X Q. How much carbonized paper did you use in such lamp?

A. Perhaps a length of it; about two or three inches.

248 X Q. Can you produce that lamp?

A. No, sir; it is substantially the same kind of a lamp as that shown in Fig. 2, patent 224,329.

249 X Q. Was the carbonized paper used *in vacuo?*

A. No, sir.

250 X Q. What was your object in making this experiment with carbonized paper in January, 1879?

A. To make what we called a "shop lamp"—one in which the current only had to be subdivided in a shop and not over a large area, where high resistance was not absolutely essential.

251 X Q. Why did you use carbon made of paper in preference to carbon made of anything else in that lamp and for that experiment?

A. Because it was easy to make, and produced the proper kind of contact desired, and we had no means of making hard carbons with any degree of facility.

252 X Q. Was the paper specially carbonized for that experiment?

A. I cannot remember.

253 X Q. Was the experiment made in your presence?

A. I think I made it myself.

254 X Q. What was the result?

A. It worked fairly.

255 X Q. Why have you not mentioned this experiment in your previous testimony?

A. I forget why; perhaps, because the question has not been asked me.

498 256 X Q. Did you make any other experiments between the fall of 1878 and the fall of 1879 with carbonized paper for incandescent electric lighting than those you have already testified about?

A. No; I think not with carbonized paper.

257 X Q. Have all of your attempts of electric lighting been by incandesence?

A. No, sir; not all, but most all.

258 X Q. Is it your conviction now that electric lighting by incandescence can be successfully accomplished with carbon made of paper *in vacuo?*

A. Yes, sir; it was successfully accomplished by me.

259 X Q. State, if you please, when it was that you first reached the conviction that electric lighting could be successfully accomplished by carbonized paper *in vacuo?*

A. In September or October, 1879; that it could be accomplished by the use of carbonized paper in high and stable *vacuo*, which were the proper conditions.

260 X Q. Did you, previous to September or October, 1879, make and use carbonized paper for electric lighting by incandescence *in vacuo*, successfully?

A. I have already testified on that point quite clearly. My answer will be the same as answer to X Q. 232.

261 X Q. The answer to X Q. 232 does not answer my last question, which is repeated?

A. My previous answer answers it perfectly.

262 X Q. What do you understand by the word "successful," in the relation that I used it in X Q. 260?

A. Several understandings have passed through my mind. Sometimes an experiment is a successful experiment when it don't work, if it proves positively or negatively, or shows possibilities. It may or may not be considered successful, and in my answer to X Q. 232 I have stated fully about the success and non-success of these experiments.

499 263 X Q. In cross-question 260 I did not ask you anything about experiments, but about successful lighting, and I now ask you again, when you first succeeded in lighting successfully by incandescence with carbonized paper *in vacuo?*

A. If you mean when I first succeeded successfully in lighting up a piece of carbonized paper *in vacuo* by electrical incandescence I will state that it was done in Edison's Exhibit First Incandescent Lamp.

264 X Q. How long did you say you succeeded in illuminating that lamp with carbonized paper *in vacuo?*

A. Several minutes, but the vacuum was a poor one.

265 X Q. Well, how many minutes?

A. Perhaps ten minutes.

266 X Q. Do you consider an electric lamp that goes out in ten minutes successful lighting by electricity?

A. It is the successful lighting of the lamp for ten minutes by electricity.

267 X Q. Are you now making and using incandescent electric lamps in which you use carbonized paper for the illuminating portion of the lamp *in vacuo?*

A. Yes, sir.

298 X Q. How do the lamps you are now making and using differ from the Exhibit Edison's Commercial Incandescent Lamp?

A. Differ only in shape.

269 X Q. How does the shape differ from the exhibit?

A. The carbon is in the form of an arch, but does not come together at the electrodes so near as in the exhibit.

270 X Q. Is the glass chamber of the same form?

A. Some lamps are, and some are pear-shaped.

271 X Q. Is the carbon of the same dimensions that you have given of the carbon in the exhibit?

A. Pretty near the same, I think; I have none here for comparison.

272 X Q. How many of these lamps have you in use?

A. I cannot say; they have been sent all over the wor-d. We have a stock on hand for use when other necessary appliances are ready.

500 273 X Q. State approximately how many you have sold or have in use.

A. We have sold three or four hundred.

Counsel for Edison produces record book containing the copy of Edison's Exhibit No. 4 and 5, and submits it to the inspection of counsel for Sawyer & Man.

274 X Q. Referring now to your record book No. 67, pages 1 to 15 inclusive, of which Exhibit No. 3 is an alleged copy, please to state whether this record was kept by you personally.

A. No, sir; it was not.

275 X Q. Please to state by whom it was kept.

A. Partially by Charles Bachelor, and partially by a man named Herrick, I think.

276 X Q. Was it kept by those persons in your presence?

A. I was present. I should say almost all the time in the room with the parties when this record was made.

277 X Q. In whose handwriting is the record?

A. Partially in Batchelor's, partially in Herrick's I think, and some of my writing is on it.

278 X Q. Were the entries made in that record by the different persons mentioned, all made at the same time?

A. About January 1st, 1880, it was decided to keep the burning time of the lamps manufactured, and this record was the starting point of the time, and was started in a systematic manner by Mr. Batchelor, I believe, on January 2d, 1880, and he, I believe, put down on January 2d the numbers of the lamps, their position, and the time they had burned previous to January 2d; and thereafter the exact burning hours were kept by him and Mr. Herrick; and the entries, I believe, were made the day after the date on the entries.

279 X Q. These lamps to which the record refers, when were they made?

A. Some time in December, 1879.

501 280 X Q. Is a portion of this original record in lead pencil?

A. Yes; a very small portion.

281 X Q. By whom was that portion of it made?

A. One portion by myself and the other portion by Charles Batchelor.

282 X Q. When did Mr. Batchelor make his entries in lead pencil, and when did you make yours?

A. I made mine January 5th, 1880. Mr. Batchelor has dated his entry January 2d, 1880, 8 p. m. I believe that I know that he made that entry at that time.

283 X Q. Are the figures in ink that notes the day of the month, the number of hours and minutes the respective lamps burned, in the handwriting of Mr. Herrick?

A. I think part of them are in Mr. Batchelor's handwriting, and part in the writing of Mr. Herrick.

284 X Q. And these figures were made, you think, either on the day of the date or the day after?

A. Yes, sir; I think they were.

285 X Q. Do you know that of your own knowledge?

A. Yes, sir; I am almost certain.

286 X Q. When did you get the vacuum pump illustrated by Edison Exhibit No. 6?

A. That particular shape vacuum pump was made some time in September, 1879.

287 X Q. Previous to getting that pump, did you succeed in getting a satisfactory vacuum in your lamps? I mean a vacuum in which your carbon burners will endure incandescent for any reasonable length of time?

A. Yes, sir.

288 X Q. When did you first succeed in getting such a vacuum?

A. I think it was in August, 1879, that we had a pump that would produce a vacuum up to perhaps the hundred-thousandth part of an atmosphere.

289 X Q. Was that the first — you obtained the necessary vacuum in your lamp?

502 A. My impression is that that was the first pump by which a partially satisfactory vacuum was obtained.

290 X Q. Referring now to Edison's Exhibit No. 2, being the New York Herald, or part of it, dated December 21st, 1879, state, if you please, whether you wrote or caused to be written the article headed "Edison's light," on page five, and to be illustrated as there illustrated.

A. No, sir; I did not write it, nor did I cause it to be written.

291 X Q. Did you revise or examine it after it was written, and approve of it?

A. No, sir; I did not.

292 X Q. Are its statements true?

A. Some are and some are not. The article seems mostly to be made up from my patents, into which a great deal of romance has been injected.

293 X Q. Are the illustrations true illustrations of the lamp referred to in the article?

A. Not strictly true. Most of them have been taken from the patents. Two I recognize as having been taken from the Scientific American.

295 X Q. Which of the illustrations are correct, and which are erroneous? Please mark the figures.

A. The figures are substantially correct as illustrations. Figures eight and nine are copied from the Scientific American's articles. Figures 1, 2, 3, 4, 5 and 6 seem to be taken from patents or caveats. Figure 7, I do not know how that was obtained. It is substantially correct, but not correct in detail.

296 X Q. State, if you know, who is the auther of the article.

A. I believe a reporter of the New York Herald, named Edwin Fox, was the author.

297 X Q. What part of the article is true, and what part romance?

A. That which is descriptive of the apparatus is substantially correct. The rest is an ingenious weaving in of the experiments and talk at the laboratory, and imagination of the reporter, into a separate article, in a proper form to appeal to the imagination.

503 298 X Q. Within a few days after the publication of that article, do you recollect of telling any-one, that it was true every word of it, or something to that effect?

A. No, sir; I don't recollect of telling any one that it was true every word of it. I might have been asked by a number of people if that Herald article was correct, and might have replied that it was correct, meaning that the results I had attained had been attained.

299 X Q. What degree of vacuum is it necessary to maintain in the chamber of your lamp to make the carbon endure in a state of incandescence for one hour, so as to produce a luminosity equal to 15 candles?

A. Never having tried that exact experiment I cannot state.

300 X Q. What degree of vacuum would be necessary to be maintained to ensure the endurance of the carbon in a state of incandescence equal to a luminosity of 15 candles for two hours?

A. Never having tried that exact experiment I cannot say.

Q. 301 X Q. Same question, during a period of three hours, or four hours, or five hours, or any number of hours of which you have actual knowledge, as to the endurance of the carbon illuminated to the degree of incandescence mentioned in my question No. 299?

A. I cannot give exact results, but my impression is from noticing lamps having poor vacuums, and lamps on the pump where there was a g*ua*ge, that generally the carbon would not last at that incandescence more than four or five hours when the barometrical mercury column showed a vacuum of only about a millimeter. This has reference to my lamp, when it is to be worked in vacuum.

302 X Q. Does the invention described in your application for a patent in this interference include a vacuum in the illuminating chamber of the lamp?

Question is objected to, upon the ground that as the application itself is in testimony, it is the best evidence.

A. The application itself is the best evidence of that.

504 303 X Q. What does the application say upon the subject?

Same objection as before.

A. Being in evidence it can be referred to, to ascertain what it says.

304 X Q. I have no complete copy of the application, nor has any been put in evidence; please to read from the specification, if you have one, what is said upon that subject.

Question objected to, for the reason that the application by the rules of the Patent Office is a part of the record testimony, and counsel for Sawyer & Man is entitled to a copy at any time by asking for it at the Patent Office and paying for it.

Counsel for Sawyer & Man states that counsel for Mr. Edison prompts the witness by putting a copy of the specification in his hands and telling the witness to say that he would very cheerfully read the specification if he had a copy of it, but does not know whether his copy is a correct copy, his copy being the retained papers or roughs of the specification, in which many alterations seem to have been made.

A. I have no specification which I am sure is a correct one.

305 X Q. Do you know whether the carbonized-paper burner, making the subject-matter of this interference, is intended to be illuminated in vacuum?

A. That is one of the intentions, according to my recollection.

306 X Q. Do you know whether the carbonized burner, making the subject-matter of this interference, is intended to be illuminated in a glass chamber from whence the air has been exhausted, and an inert gas substituted in the chamber?

505 A. It was intended mainly to be worked in vacuum, but I also intended and did try some of these paper-carbon loops in a sealed glass receiver containing an inert gas, or intended to be inert.

307 X Q. How long did the paper-carbon loops, tried in the inert gas, endure when they were illuminated?

Question objected to, as not being proper cross-examination.

A. I do not remember.

308 X Q. State as nearly as you recollect.

A. The ones I saw, I think lasted five minutes; and, perhaps, one of them lasted an hour, or even two hours.

309 X Q. Did you make the experiments yourself?

A. No, sir.

310 X Q. Who made them?

A. I think one of the parties was named Francis Jehl.

311 X Q. Where were they made?

A. At my laboratory at Menlo park.

312 X Q. When were they made?

A. My impression is that they were made either in December, 1879, or January, 1880.

313 X Q. What gas was used in the chamber?

A. I did not analyze it.

314 X Q. Don't you know?

A. I know what we intended to use.

315 X Q. What did you intend to use?

A. Hydrocarbon gas, hydrogen gas, nitrogen gas, hydrochloric acid gas and chlorine gas, I think.

316 X Q. How many experiments did you make?

A. I saw two or three.

417 X Q. What kind of gas was the chambers filled with in the experiments that you saw?

A. I didn't analyze it.

318 X Q. Don't you know?

A. I would not absolutely know without analyzing it.

319 X Q. Do you know what was intended to be used?

A. I have already testified what gases were intended to be used, but cannot be certain as to which gas was used in the experiments I saw.

506 320 X Q. Do you know whether any of these gases were used in a state of purity in charging the illuminating chamber of the lamp?

A. I don't know that they were pure.

321 X Q. Do you know at what pressure the gas was put in the chambers of the lamps?

A. My impression is, at atmospheric pressure.

322 X Q. Have you made or caused to be made any other experiments in illuminating by incandescence with paper carbon in a sealed lamp filled with inert gas, than those you have referred to in the immediate preceding answers?

A. Yes, sir; I have made them with a gas which is supposed to be inert.

323 X Q. When were these other experiments made?

A. While not intended, the lamp Exhibit Edison's First Incandescent Lamp, did have a gas in it formed by the decomposition of the grease used in the lamp at the joints, as I have already stated in my evidence, and at times, since January, 1880, lamps have been made in which simple and compound gases have been used experimentally, to determine theoretical points. I have also used in the early part of 1879, perhaps in December, 1878, gases, especially hydrogen, in a lamp giving light by incandescence, but in this case platinum was used.

324 X Q. Does electric lighting by incandescence with carbon in sealed lamps charged with inert gas, make any part of the invention described in your application for a patent in this interference, or intended to be described in that application, or does it make any part of your system of electric lighting by incandescence?

Counsel for Mr. Edison objects to all that portion of the question which relates to the specification, on the ground that the specification itself is the best evidence.

507 A. The specification itself will be the best answer that I can give the question, and I do not desire to state what I intend or what I do not intend to use in my system of electric lighting.

325 X Q. Has electric lighting by incandescence with carbon in sealed lamps, charged with inert gas, heretofore made any part of your system of electric lighting by incandescence?

A. I have already testified that I have tried the same, and as I had a system of electric lighting at Menlo Park at the time, these formed a part of the system at that time.

326 X Q. Do you mean to swear that you have used at Menlo Park a system of electric lighting by incandescence in which carbon was used as the illuminating portion of the lamp, in an atmosphere of inert gas in a sealed lamp?

A. Yes, sir; such a lamp formed part of a system of lighting by incandescence of carbon at Menlo Park.

327 X Q. When?

A. In December, 1879, or in January, 1880, I think.

328 X Q. What kind of carbon did you use?

A. Carbon made out of paper.

329 X Q. How long did you use that system?

A. The system is still there.

330 X Q. How many lamps did you use of the kind I have described in my question No. 326?

A. We have used on that system at Menlo Park, I should say, as many as thirty lamps, but as to the inertness of the gas on the carbon, I am not sure as any gas whatsoever has an effect on the carbon.

331 X Q. How many sealed lamps have you used that were charged with gas that was intended to be inert, and the illuminating part of which was made of carbonized paper?

A. I have already testified that no gas is inert and therefore I could have made no lamps in which it was inert.

332 X Q. Question repeated.

A. No lamps that were inert, because I knew that no gas could be used that was inert, all gases having effect on the carbon.

Answer objected to as irresponsive.

508 333 X Q. Question repeated.

A. I have already testified to that question.

334 X Q. How many sealed lamps have you used that were charged with gas, commonly called inert, and the illuminating part of which was made of carbonized paper?

A. My impression is that a half dozen were made.

335 X Q. How long did you continue to use them?

A. I did not see more than two or three and those didn't last more than from fifteen minutes to an hour.

336 X Q. State, if you please, whether the Exhibit Edison's First Incandescent Lamp is the apparatus referred to in answer 9 of your examination-in-chief?

A. Yes, sir.

337 X Q. What experiments have you made in treating carbons for electric lighting, made of paper, electrically in a hydrocarbon gas?

A. The experiment with the first incandescent lamp might be considered an experiment with a hydrocarbon gas; I have tried other experiments in treating paper with an atmosphere of a hydrocarbon gas since that time.

338 X Q. Please to relate what experience you have had in treating carbon electrically in a hydrocarbon gas, for the purpose of enlarging or purifying the carbon, or consolidating it?

Question objected to as a cross-examination upon matter not involved in this interference, and involved in another interference to which Sawyer & Man are not parties.

Counsel for Sawyer & Man says that the witness in his examination-in-chief has expressed opinions about the utility and practicability of treating carbons in that way, and that the question is pertinent to matters testified to by the witness in his examination-in-chief.

A. I have brought up to incandescence a carbon within a lamp
containing a hydrocarbon; I have done it in a great number
509 of lamps, a hundred or more; I have tested the economy, the
conductivity and other properties of the carbon, and have
examined the same many times under a powerful microscope.

339 X Q. When did you make the experiments?

A. They were made previous to the declaration of this interference; a hydrocarbon gas was used, I think, in December, 1879 and '80, but not for the purpose set forth in your question.

340 X Q. Have you had any experience in treating carbon for illuminating purposes in electric lamps, electrically in the presence of hydrocarbon gas or fluid, previous to putting them in the sealed illuminating chamber of the lamp?

Question objected to as improper cross-examination, no inquiry having been made about the same in the examination-in-chief.

A. Yes, sir.

341 X Q. Please to relate what experience you have had in treating carbons in that way, and give the dates of your experiments?

A. I have no memorandum with me which would refresh my memory as to the dates, but it was previous to the declaration of this interference that I tried experiments of heating to incandescence a carbon conductor in a hydrocarbon gas within a fluid, and also heating a carbon conductor to incandescence by an electric current in a gas within a chamber not sealed.

342 X Q. How many carbon burners have you treated in that way?

A. I should say twenty or thirty.

343 X Q. When did you do it? State as nearly as you can recollect?

A. Some time between March and September, 1880.

344 X Q. Is that as near as you can give the date?

A. Yes, sir, as I have no memoranda here, not thinking that this question would come up.

345 X Q. Please to describe your method of treating these
510 carbons in hydro carbongas electrically, including the apparatus you used in your experiments?

Same objection as before was repeated.

A. As the details of the mechanism which I used is the subject-matter of another interference, I refuse to answer.

Counsel for Sawyer and Man insists upon a responsive answer to this question, and gives notice that unless the witness answer the question he will move to strike out the deposition.

346 X Q. Question repeated.

A. I have already described them sufficiently. I stated that the carbon was brought to incandescence by electricity when within a gas within a liquid, and also when within a gas within a chamber not sealed.

347 X Q. What kind of a chamber was it, and how was the carbon conductor arranged in the chamber, and what kind of hydrocarbon fluid and gas did you use?

A. It was a glass chamber, the carbon was within the chamber arranged so that the electricity could pass through it, and gasoline was used.

348 X Q. How did the treatment affect the carbon treated?

A. It brought its resistance down and deposited a crust of hard carbon over its surface which under the microscope showed a multitude of projecting points which were found to be hollow when broken.

349 X Q. Of what material was the carbon made, that you treated?

A. Both paper and bamboo.

350 X Q. After you had treated the carbon did you put it in the sealed chamber of an electric lamp and raise it to incandescence, and if so with what result?

A. Yes, sir; some of them we did. The result was that it
511 was lower resistance and seemed to be more susceptible to destruction by electrical carrying than the untreated carbons.

351 X Q. To what degree of luminosity did you raise it?

A. Varying degrees of luminosity.

352 X Q. Please to name them?

A. I think as high as a hundred candles.

353 X Q. How long did the carbon burner last raised to the luminosity of a hundred candles?

A. My impression is that it lasted about two hours. It was a very fine filament.

354 X Q. Please to give its dimensions.

A. I cannot give its dimensions. We had carbons of various dimensions. These were tried on very fine filaments. It was a thinner one than that shown in the Exhibit "Edison's Commercial Incandescent Electric Lamp." It was a little longer. I should say it was a quarter of an inch longer. I am referring to the one that lasted two hours, yielding a hundred candle power.

355 X Q. Was it in vacuum?

A. Yes; in very high vacuum.

356 X Q. Does the successful use of the lamp described and illustrated in the application for the patent involved in this interference necessitate a high vacuum in the illuminating chamber?

A. In a commercial sense it is my opinion, which results from my experiments, that it is essential to have a high vacuum in the lamp chamber, for the reasons I have heretofore stated.

357 X Q. Are you now manufacturing incandescent electric lamps substantially like that described and illustrated in the application for the patent involved in this interference, commercially?

A. The electric lamp company, with which I am connected, are manufacturing lamps of this kind and selling them to electric light companies.

358 X Q. What company do you refer to as that with which you are connected, that is manufacturing these lamps commercially?

A. The Edison Electric Lamp Company.

512 359 X Q. What proportion of the lamps so manufactured by the Edison Electric Lamp Company are fitted with carbon burners made of paper?

A. From one and a half to two per cent., I should say. I have not looked over their books lately. I know that a man is now engaged, and has been at different times in the last three months, in making paper carbons for use at the lamp factory.

360 X Q. Are the carbon burners with which these lamps are fitted made upon the plan described in the application for the patent involved in this interference?

A. Yes.

361 X Q. Please to give the dimensions of these carbon burners.

A. I should say they were about an eighth of an inch, perhaps a quarter of an inch shorter than the one shown in the Exhibit Edison's Commercial Incandescent Lamp.

362 X Q. How does it compare in diameter to the burner referred to in your last answer?

A. I should judge that it was a shade wider, but have no idea as to how thick it is.

363 X Q. What, no idea as to how thick it is?

A. If it was a foot thick, I think I should probably have an idea; but as these filaments are always made out of thin paper, I cannot state whether it is thicker or thinner than the one in Edison's commercial incandescent lamp.

364 X Q. Please to give as nearly as you can the dimensions of the carbon burner in Edison's commercial incandescent electric lamp.

A. I guess it is about an inch and a quarter from the top of the clamps to the top of the loop; about seven-eighths of an inch from one side of the loop to the other. I should judge the width was twenty-thousandths of an inch, and five-thousandths of an inch thick.

365 X Q. To what degree of luminosity are these lamps, which
you say the Edison Lamp Company are manufacturing com-
513 mercially, fitted with carbonized-paper burners, brought or
intended to be brought in practical use?

A. Sixteen candles, I believe.

366 X Q. How do you measure the candle-power of a burner?

A. With a photometer.

367 X Q. What photometer do you use to measure your candle-power?

A. The Bunsen spot photometer.

368 X Q. Referring again to the Exhibit Edison's Commercial Incandescent Electric Lamp—please to state, as near you can, what its luminosity was during the time of its burning, as noted in the record about which you have heretofore testified, and of which you have given a transcript of, page 39?

A. My impression is that the average candle-power would be about from twelve to sixteen candles.

369 X Q. You say that about one or one and a half per cent. of the lamps that are manufactured by the Edison Electric Lamp Company are fitted with carbonized-paper burners. Please to state what is the whole number of lamps manufactured by that company per day?

A. About a thousand per day.

370 X Q. Have you ever made any carbons from several thicknesses of blotting paper, pressed together under a hydraulic press?

A. I have made carbons of several thicknesses of blotting paper pressed together under a screw press, but not under a hydraulic press.

371 X Q. Where is the Edison Electric Lamp Company situated—I mean its factory?

A. At Menlo park and at Newark.

372 X Q. Does that company sell lamps to any who may wish to purchase them?

A. Yes, in foreign countries, and in this country by the permission ot another company—the Edison Electric Light Company.

373 X Q. Does that company treat the carbon burners of
514 their lamps electrically in the presence of hydrocarbon gas
before they use them for illumination—I mean the Edison
Electric Lamp Company?

A. Not lately.

Cross-examination ended.

Counsel for Edison, in pursuance of the notice given at the close of his examination-in-chief, puts in evidence letters patent of Thomas A. Edison, No. 224,329, dated Feb. 10, 1880; 227,227, dated May 4, 1880; 227,228, dated May 4, 1880; 227,229, dated May 4, 1880; 223,898, dated January 27, 1880; also specification of English patent of Thomas A. Edison, No. 2,402, June 17, 1879; also letters patent 205,144 of Sawyer & Man, dated June 18, 1878; 210,152 of Sawyer & Man, dated November 19, 1878; 210,809 of Sawyer & Man, dated December 10, 1878; 219,771 of Wm. E. Sawyer, dated

September 16, 1879; 211,262 of Sawyer & Man, dated January 7, 1879; 229,335 of Sawyer & Man, dated June 29, 1880; 227,118 of Albon Man, dated May 4, 1880.

It is stipulated between counsel for Edison and Sawyer and Man, that the Government printed copies of these patents may be read in evidence with the same force and effect as if they were certified copies put in evidence and marked as exhibits in the case, counsel for Edison agreeing to furnish counsel for Sawyer and Man with at least three of each of such printed copies; and it is further stipulated that the said Government printed copies of all the patents put in and referred to as evidence on behalf of Sawyer and Man, with like effect, counsel for Sawyer and Man agreeing to furnish counsel for Edison with at least three of such printed copies. Said patents to be subject to all legal objections, nevertheless, that might be taken or urged against them if they were regularly put in evidence as exhibits; and counsel for Sawyer and
515 Man objects to the above-mentioned patents as evidence in this case, on the ground that they are not pertinent or relevant or competent as evidence upon any issue in this controversy, and request counsel for Edison to state upon the record how such patents are competent, relevant, or material upon any issue in this controversy.

Counsel for Edison replies that when the matter comes up for hearing an attempt will be made to show that such evidence is material.

Re-examination of the witness by GEORGE W. DYER, of counsel for Edison:

371 Q. Referring to your answer on cross-examination, as to your experience in making and using carbons of paper in 1876 and 1877, did anything remain to be done by you prior to 1878 to determine the qualities essential in the paper carbon for an incandescent conductor for an electric lamp?

Question is objected to upon the ground that it does not appear by any of the witnesses' answers on cross-examination that he made any carbons of paper in 1876 and 1877 for electric lamps, nor does it appear from anything the witness has said, either upon his examination-in-chief or his cross-examination, that he successfully used carbonized paper for electric lighting by incandesence previous to the fall of 1879, and upon the further ground that all of the witness' testimony intended to prove or going to prove that he made the invention, or any part of it, previous to the date alleged in his preliminary statement, is inadmissable under the rules of the Patent Office and its well-established practice; and upon the further ground that the question is intended to bring out matter upon which the witness was previously examined in chief, and not upon anything new brought out in cross-examination.

A. No, sir.

516 372 Q. Referring now to your answers upon cross-examination, when did you first determine the sufficiency of car-

bonized paper *per se* for an incandescent conductor for an electric lamp?

Question objected to because it is indefinite as not referring to any particular answer to any question on cross-examination; and upon the further ground that the question is not when he first determined the sufficiency of the carbonized-paper burner, but when he first proved its sufficiency by actual use; and upon the further ground that the question refers to experiments made before the time given in the preliminary statement.

A. I knew from my experiments in 1876 and 1877, where I employed carbonized paper and other carbonized organic substances for resistances, that carbon in that state of aggregation had high resistance as compared to hard or coke carbon, and was the proper form to use for incandescent conductors for electric lamps, if they were to be worked up in multiple arc, and the experiment with the strip of carbon in the open air, and in the Exhibit Edison's First Incandescent Electric Lamp, used in 1877, also showed its adaptability and sufficiency for multiple arc lighting.

373 Q. In 1877, did you require any farther information or experiments to determine the sufficiency of incandescent conductors for electric lamps made with carbonized paper?

Question objected — as referring to a date previous to the date of the preliminary statement, and also as not bearing upon the question of when witness did make the invention in the interference by its actual and successful use, and on the further ground that the witness has already been examined in chief on that very point.

A. No, sir.

517 374 Q. Referring again to your answer upon cross-examination, wherein you stated that since your experiments in electric lights had been resumed in 1878, you had been working upon the same day and night, please give in a general way the nature of your labors in electric lights up to 1880, and the assistants employed by you and the general nature of their duties?

A. In the fall of 1877, having about finished my labors with my carbon telephone, I had several ideas which I desired to work up, one of them being the subdivision of the electric light, hence I commenced experimenting for that purpose, as my testimony and exhibits show. These experiments continued, I think, until January, 1878, when my time and attention was absorbed by the excitement caused by the invention and exhibition of the phonograph. This continued until July, when my health being broken down by several years of continuous labor, I went to California and other places West, spending about two months. On my return, in August, 1878, I immediately took up the experiments made in 1877, but interrupted by the phonograph and the state of my health, and have continued them night and day ever since. About December, 1878, I engaged a mathematician named Mr. Upton to assist me in working out the complicated problems as to economy and adaptability of the various devices necessary to make a complete system

of electric light by incandescence which would be capable of replacing or competing with gas, over large areas, such a system, comprising main conductors, house conductors, lamps of various characters, meters, dynamos, electro-motors of various kinds and characters, apparatus for regulating the pressure of the flow of electricity through such system, arrangement of the system of conductors for equal distribution of the electricity, safety devices, boilers, steam engines, electrometers, photometers and other appliances. I had other assistants, among whom may be mentioned Francis Jehl, John Kruesi, Charles Clarke, Charles Batchelor, William Hammer, Mr. Herrick, Dr. Haid, Mr. Lawson, Martin Force, Dr. Moses,
518 E. H. Johnson, and many others who were employed in 1878 and 1879. Possibly Clarke and Hammer may have started work in the early part of 1880.

Answer objected to, as to all work and experiments made before the date given in the preliminary statement, in so far as such relates to the issue in controversy.

375 Q. In your answer to question 374 you have not stated the nature of the duties of the assistants employed by you. Please do so now?

A. Francis Jehl was employed generally to assist in any kind of experiments. John Kruesi was foreman of the machine shop; Charles Clarke, mathematician and mechanician; Charles Batchelor, principal assistant on general experimenting; William Hammer, assistant on vacuum pumps; Mr. Herrick, time-keeper for the lamps; Dr. Haid and Mr. Lawson, chemists; Martin Force, assistant on any experimenting; Dr. Moses, chemist and assistant on general experimenting; E. H. Johnson, assistant outside of laboratory generally.

376 Q. Have you been present this morning during the examination of J. Kruesi, and have you seen the memorandum book produced by Mr. Kruesi and marked Edison's Exhibit No. 12?

A. Yes, sir; I have.

377 Q. In view of the testimony of Mr. Kruesi, and of your examination of his memorandum book, Exhibit 12, are you able to refresh your memory as to dates of early experiments with electric lamps?

A. I undoubtedly tried some experiment with an electric lamp about the time stated in the book Edison's Exhibit No. 12, but I cannot remember the nature of the lamp or recall to memory the results of these experiments.

378 Q. Are you satisfied in your own mind that the repair of an air pump noted in the memorandum book Exhibit No. 12, under date of January 29, 1877, had some connection with an electric lamp?

519 A. Yes, sir; my impression is strong that the pump was used in connection with the electric lamp, as I cannot conceive what other use it could be used for about that time, and could conceive that it could be used for an electric lamp.

379 Q. Since ceasing to give the testimony which you have now

resumed, has search been prosecuted for exhibits relating to early experiments in electric lights, and if so, with what results?

A. Yes, sir; Mr. Batchelor has found two or three exhibits, one of which is in my handwriting, which I now produce.

Witness produces a paper which is put in evidence and marked Edison's Exhibit No. 13.

Exhibit objected to upon the grou*n*nd that it is intended to prove the invention in controversy was made or conceived of previous to the time stated in the preliminary statement, and upon the further ground that it is immaterial to any issue in controversy.

380 Q. Please examine the paper, Edison's Exhibit No. 13, state when it was made, how you know that fact, and what it shows?

A. The sketch was made October 5th, 1877. It is signed by myself and is in my handwriting. It is witnessed by Charles Batchelor. It is headed, electric light, and illustrates the principle for subdividing the electric light. The top figure represents a circuit in which there are resistances, around which are incandescent electric lamps consisting of two electrodes with silicon between them. The second figure represents the same kind of electric lamps worked in multiple arc. The third represents them worked in series.

381 Q. Does this Exhibit No. 13 refresh your memory as to the production of, and experiments with Edison's Exhibit First Incandescent Lamp, about which you have testified, and if so, how does it refresh your memory?

520 Objected to, as going to show that the invention was made previous to the date alleged in the preliminary statement of Mr. Edison.

A. It does. It refreshes my memory as to the date that I tried the first incandescent lamp. Because I went from the carbon on to experiments with silicon; owing to the sensitiveness of the carbon to oxidation, and I know that the carbon experiments were previous to the date of this exhibit, October 5th, 1877.

382 Q. Since you gave your testimony before in this case, have you been constantly absent from this office?

A. Yes, sir; I have.

Counsel gives notice that he here closes his re-examination of Mr. Edison, and offers him for recross-examination.

383 X Q. What qualities must paper carbon have to render it sufficient for an incandescent conductor in an electric lamp?

A. The paper should be free from adulterations, and compact and well carbonized. It will then have a high resistance per unit length and thickness, and if cut as a filament the lamp in which it is used will have high resistance.

384 X Q. What qualities must any carbon have to render it sufficient for an incandescent conductor in an electric lamp substantially like Exhibit Edison's Commercial Incandescent Electric Lamp?

A. My impression is that all kinds of carbon, except, perhaps,

the diamond, are the same, and their different appearances are due to their structural arrangement. I think that hard gas-retort carbon and paper carbon are the same kind of carbon, and the difference consists in their structural arrangements. Paper carbon, wood carbon, and in fact, all carbon derived from vegetable organic matter of cellular formation when carbonized are very porous, hence the resistance to the passage of the current through a square millimeter section, and one inch long of paper carbon or wood carbon, would be very much less than if the same was made of hard
521 retort carbon, and as a high resistance is a desirable thing to make a commercial incandescent lamp, then paper and other organic carbon has the desirable property, owing to its cellular structure of giving such high resistance. Almost any kind of carbon could be used under the conditions of the lamp, marked Edison's Commercial Incandescent Electric Lamp, and the same results could be obtained as to candle power and amount of energy. But the quality, or rather the aggregation of the carbon to form the incandescent conductor should be such as to offer high resistance to the passage of the current to allow of commercial subdivision. And this quality organic carbon is possessed of.

Answer objected to by counsel for Sawyer and Man as irresponsive.

385 X Q. Question repeated and counsel disclaims any desire to induce the witness to reveal any new discovery he may have made in the treatment or quality of carbon, but asks him to state merely the qualities that he thinks the carbon should possess to make it suitable for an illuminating conductor in an incandescent electric lamp?

A. I do not think I can make my answer any plainer than I have already done.

386 X Q. Must it have the quality of hardness and uniformity of texture?

A. It must have uniformity of texture, but it is not essential that it should be hard—that is, the carbon as a whole.

387 X Q. Must the texture of the carbon be fine?

A. No, sir; it is not essential.

388 X Q. Must it be solid?

A. No, sir; I prefer to have it structural—formed of cells.

389 X Q. Must it be cellular, and must the cells be small or fine?

A. It must be aggregated together in such a manner that the total weight of the carbon between the two electrodes shall,
522 with a given radiating surface, be far less than if the carbon was perfectly dense, and the interstices may be large or small within the carbon?

390 X Q. Then, as I understand you, it does not matter whether the interstices or cells be large or small, provided the total weight of the carbon between the two electrodes shall, with a given radiating surface, be far less than if the carbon was perfectly dense?

A. No, sir; I speak within the limits of the ordinary size of organic vegetable cells.

391 X Q. Must the carbon have a high resistance?

A. The burner, as a whole, should have a high resistance, for reasons I have already stated.

392 X Q. When did you first discover that carbon made of paper would offer a high resistance to the passage of the current, to allow of commercial subdivision, so as to make it a suitable illuminating conductor for your lamp. I mean Edison's Commercial Incandescent Electric Lamp?

A. I knew that it had high resistance from my use of it in 1876 in rheostats, and in my telephonic experiments in 1877, and that it had a proper resistance to admit of subdivision in multiple arc. In my Exhibit No. 4 I have placed the boron, which is high resistance, in multiple arc, and the silicon, which is low resistance, I was compelled to use in series, and I was perfectly aware when I made the Exhibit First Incandescent Lamp that organic carbon was the proper kind to use, as with a small mass it had high electrical resistance.

Last part of the answer objected to by counsel for Sawyer & Man as irresponsive.

323 X Q. What was there in the experiments you made with Edison's Exhibit First Incandescent Lamp that enabled you to determine that carbon made of paper would offer a high resistance to the passage of the current, so as to allow of commercial subdivision, as you have stated?

A. I have already stated that I knew it beforehand.

523 394 X Q. Then there was nothing, as I understand you, in the experiment that added to your store of knowledge upon that point?

A. Not regarding the resistance of organic carbon, except confirmatory of what I already knew.

395 X Q. Then, as I understand you, when you made or caused to be made the lamp, Edison's Exhibit Commercial Incandescent Electric Lamp, you knew, not from any experiment upon the subject, but from your knowledge of the properties of paper carbon, that it would make a suitable illuminating conductor for your electric lamp, that it would offer a high resistance to the passage of the current and would allow of commercial subdivision?

Question objected to upon the ground that it does not correctly state the testimony of the witness upon this subject, he having testified to experiments in 1876 which resulted in his knowledge of certain qualities pertaining to paper carbons.

A. I have already stated that I knew from my experiments in the use of carbonized paper in rheostats in 1876, in telephones in 1877, confirmed by the experiments in 1877 on the first incandescent lamp and in 1878 also on paper carbons, that such carbon had such a high resistance as compared to its radiating surface as to admit of commercial subdivision, providing the incandescent conductor could be made small enough and be burned under proper conditions.

396 X Q. When did you ascertain whether or not the conductor could be made small enough and burned under the proper conditions?

A. I ascertained and obtained the proper conditions to allow of the conductor being made small enough some time in October, 1879. This was when it was placed in high vacuum.

397 X Q. Without any reference to your experiments with your
first incandescent lamp, did you know from your experiments
524 with paper carbon in rheostats in 1876, and in telephones in
1877, that it would make a suitable illuminating conductor
for an incandescent electric lamp?

Question objected to as obscure and misleading.

A. I knew upon the day that I tried the experiment on the first incandescent lamp that such carbon would be suitable, which knowledge, as far as its resistance was concerned, was derived from experiments in measuring its resistance in 1876 and 1877, as I have stated.

398 X Q. Then, as I understand you, by your experiments with carbonized paper in rheostats in 1876, and in telephones in 1877, you had ascertained the resistance of carbon made of paper. Now, how did your experiments with Edison's first incandescent lamp prove to you that carbonized paper would be suitable for an illuminating conductor in an incandescent electric lamp?

A. That experiment was not to prove the resistance of the paper carbon, but to ascertain if it could be made to stand at a high temperature.

399 X Q. Then, as I understand you, it was by that experiment that you determined the sufficiency of incandescent conductors for electric lamps, made of carbonized paper, as stated in answer to question 373 of your redirect examination?

A. I did not require any further experiments to ascertain whether paper carbon was applicable to incandescent lighting. I knew it was applicable, if conditions could be obtained under which filaments of it could be made stable at high incandesence.

400 X Q. When did you first ascertain that carbon made of bamboo possessed the requisite qualities for an illuminating conductor in an incandescent electric lamp?

Question objected to by counsel for Edison, as not being proper
cross-examination, nor pertaining to any matter brought
525 out in direct examination and not involved in this interfer-
ence, and advises the witness not to answer the question.

A. I decline to answer.

401 X Q. Why do you decline to answer?

A. In the first place, I do not see as the counsel has any business to ask the question; second, it is not in the controversy; third, my counsel advises me not to answer it; and fourth, that it would require hunting for exhibits, dates, and other data to give the proper answer, which I am not prepared to do.

Counsel for Sawyer and Man, in view of the witness' refusal to answer, declines to further cross-examine the witness, and requests the examiner to certify the question to the judges of the United States circuit court of the southern district of New York.

The witness, THOMAS A. EDISON, being further interrogated, as a portion of his direct examination by R. N. DYER, Esq., counsel for the defendant, testifies as follows:

402 Q. Referring to your answer to question 61 in the interference, and which has now become a portion of your deposition in this case, is the opinion therein expressed as to the practicability of the Sawyer-Man lamp changed by an inspection of the description and drawings contained in that patent, No. 317,676, as issued, giving your reasons for any opinion you may express?

A. I find that the patent as issued; that is to say, No. 317,676, is, in a great many respects, different from the application which was in interference at the time I gave my testimony. It has been changed so much from what it originally was as filed that the answer will be somewhat different to that given in the interference case. In my interference testimony I stated that no lamp has 526 ever yet been devised, up to the present time, that was practical, which had an enclosing chamber partially made of a cup of metal and secured to the glass by cement. I find in the patent of 1885 that a plate of glass has been substituted for the metal case, which I understood they had in the original application; but, as this glass portion of the lamp performs no new function, the substitution in my answer of glass for a cup of metal arranged as shown in the new patent does not change the fact that no practical lamp has ever yet been devised, up to the present day, whereby the enclosing chamber is made in two parts, and a cementing substance, or air-excluding substance, is the medium for joining the said two parts of glass together to form a chamber. All incandescent lamps, to my knowledge, at the present date, have this union sealed so that the lamp shall be one which is utterly, absolutely and wholly of glass, and not of two parts of glass put together by some substance which is not glass. At the time of the first interference I understood from the specifications, before they had been amended, that the lamp was to be used in an atmosphere of an inert gas, but, in the altered specification, more prominence is given to the use only of a vacuous space. Hence, my answer to question 61 would be modified by this fact. I cannot see how a vacuum can be maintained in a lamp made according to the specifications of the 1885 patent to Sawyer and Man. Up to the present date I am entirely unaware of any person constructing a vacuous transparent space, which would maintain a stable vacuum of the character shown in the said patent of 1885, where the lamp is not wholly of glass. On the ordinary air pump, where a bell-jar of glass rests upon a platen of glass, and where unct*i*ous and other substances are used between the two ground surfaces, stable vacuums are impossible to obtain with the present state of perfection of air pumps. This being the case, and the*ir* being no difference between the air pump and the Sawyer-Man patent of 1885 in respect to the case (and, in fact, it is against the patent and in favor of the air pump), and the facts being as I have stated, I cannot see how 527 a commercial and practical lamp could be made by any means set forth in the specifications. I have no other amendment to make to my answer to question 61 in the interference case.

403 Q. What advantages, if any, would a construction such as is described in the patent in suit, having a glass plate secured to the bottom of the chamber, have over a similar construction provided with a metal plate or cap so secured?

A. I can see no advantage scientifically; and commercially a metal plate would be very much easier to get in shape; and, as a vacuum must be maintained by some substance at the junctures, the difference as to glass or metal would be immaterial. The metal might perhaps have some advantage by slowly oxidizing and taking up some of the residual oxygen in the vacuum, due to the heat which would be conducted through it by conduction through the electrode strips.

404 Q. The patent in suit speaks of the fact that the wall forming the chamber of the lamp is "made wholly of glass, by which all danger of oxidization, leaking, or short circuiting is avoided." What is your opinion as to the validity of these advantages?

A. I do not find in the patent that the chamber is made entirely of glass. It seems to be made of two parts of glass, with some material between the joints to prevent leaking.

405 Q. What I want to know is, whether, in your opinion, the advantages stated in the matter I have quoted from the patent in suit are fanciful or real?

A. Leaving out the misstatement in the patent, that the chamber is made wholly of glass, the mere substitution of glass for metal does not diminish the leakage, because the leakage will not take place through the metal, or the glass, but at the joints. As to the glass avoiding the danger of oxidation—if this refers to the oxidation of the carbon—then I should say that the metal had an advantage, as it would actually take up oxygen that might be left in the lamp. Regarding short circuiting, the same cementing material which is now used around the electrodes could be used to insulate the 528 same from the metal. If such cementing material failed to prevent short circuiting, it would also fail to maintain the vacuum.

406 Q. To what character of construction in incandescent lamps do you understand the expression "made wholly or entirely of glass," applies?

A. Where the chamber is really and truly made wholly of glass, through which the platinum wires are passed, and are sealed thereto, and not to glass chambers in two parts, cemented or held together by material which serves to prevent the joints leaking. The great improvement in the art, and one which made the conditions for the use of fine filaments practical, and which advanced electric lighting to a commercial basis, was the use of a chamber entirely of glass, so that no possible leakage of air could take place, even in the most minute degree, for the slightest leakage, going on continuously, would render the excessively fine filament necessary for the commercial subdivision of electrict light, impracticable to use. Were this class of lamps, with this chamber as shown in the patent of Sawyer and Man the only means known to-day, lighting by incandescence with filaments of carbon could not be a commercial success.

407 Q. Please explain the construction of the incandescent-lamp chambers which you consider answer to the description of being made wholly of glass?

A. A chamber made wholly of glass, with no other material whatsoever, through which the platinum conducting wires pass and are sealed to the glass chamber itself by fusion—such platinum wires having the same coefficient of expansion as the glass itself.

408 Q. Do I understand you to mean a chamber made in one continuous piece of glass, and without joints?

A. No; but one wholly of glass as the result of the manufacturing operation.

409 Q. Would a glass chamber having a separable joint be such a chamber?

A. If there was nothing in between the joints; but in that case you could not maintain the vacuum.

529 410 Q. Have any patents been issued to you in which the lamp chamber is described as being wholly or entirely of glass; and if so, please state what they are, or the earliest of them?

A. My electric lamp patent No. 223,898 of January 27th, 1880, has such a chamber entirely of glass. This patent states the different advantages of chambers made entirely of glass, over those made with joints. My patent No. 227,229, of May 4th 1880, also shows a chamber made entirely of glass, containing the incandescent burner. The latter specification also contains subject-matter relating to the advantages of a chamber made entirely of glass in contradistinction to being made with joints.

411 Q. When were the applications for these two patents filed?

A. The patent No. 223,898 was filed November 4th, 1879; the patent No. 227,229 was filed April 21st, 1879.

Printed Patent Office copies of the two patents referred to by the witness are offered in evidence, and are marked respectively "Defendant's Exhibit Edison Patent 223,898," and "Defendant's Exhibit, Edison Patent No. 227,229;" and it is stipulated by counsel that these printed Patent Office copies may be used in evidence in lieu of regularly certified copies of the patents; and the same stipulation is now entered into between counsel as to all such copies hereafter offered in evidence, and also as to blue-book copies of English patent.

412 Q. Referring to your answer to question 4, what do you mean by "carbonizing under strain and pressure"; and of what importance is this in the manufacture of carbons for incandescent electric lamps?

Objected to by Mr. Kerr as incompetent.

A. It is important in carbonizing conductors for incandescent lamps, that they should be restrained from free movement 530 during the act of the decomposition of the cellulos or other compounds, into carbon; otherwise, especially if they are filaments, they are greatly distorted, so as to be useless; and if distorted, there is an unequal stress among the particles of carbon, which caused unequal resistance, and a liability to rupture by the expansions produced by the high temperature used with the carbon. If this decomposition or change from the vegetable to the carbonaceous state takes place under strain and pressure, equal conductivities of heat to the same necessarily takes place through the means used to cause the carbonization under strain and pressure. It is one of the most important things in the production of an incandescent conductor, especially if the same is filamentary in character, as more or less life of the filament depends on a greater or lesser perfection in the devices for producing this result. I have a number of patents showing means and methods of carbonizing incandescing conductors under strain and pressure; and I have done a large amount of experimenting, and even to this day I am still experimenting on more perfect means of producing absolute equality and simultaneous decomposition of the whole of the incandescing conductor, so that it will be as nearly homogeneous as it is possible to make it; as the life of the filament when in the lamp depends very largely on such even carbonization.

413 Q. Kindly call attention to the patents, or some of them, that you have in mind in making your last answer?

Objected to by Mr. Kerr as incompetent.

A. Patent No. 248,423 of October 18th, 1881; patent No. 263,144 of August 22d, 1882; patent No. 263,139 of August 22d, 1882. I think I have more of those, but I do not see them at present.

414 Q. Would the disastrous distortion and unequal carbonization be prevented by packing the slips in powdered carbon, without any additional devices?

531 A. To a certain extent; but there is very little strain or stress on the carbon in this condition of carbonization, and you do not get so homogeneous a carbonization, although you prevent in a great measure distortion. Such incandescing conductors will not have the same life as those which are carbonized under proper conditions as to strain and pressure, although such incandescing conductors are sufficient where the same are to have a coating of hard carbon put on their exterior by what is known as the "flashing" process. Absolute homogen-ity of the carbon is not so essential as where the same is to be used without any subsequent treatment by the deposition of carbon, which deposited carbon really diverts the current from the original carbon, and which hard deposited carbon relieves the carbonized carbon from doing as much work as it would if used without the deposited carbon.

415 Q. In your deposition in the interference case (which is now

a part of your present deposition), you refused in answer to cross-Q. 400, to state when you first ascertained that carbon made of bamboo possesses requisite qualities for a conductor of an incandescent electric lamp. Have you any objections at the present time to making that statement? If not, kindly do so?

A. About the last of January, or near the 1st of February, 1880, we found that lamps which we made out of bamboo splints gave us abnormally greater life at high incandescence than any of the incandescing conductors made from other materials.

416 Q. What is the present material you use for your carbon filaments?

A. Bamboo.

417 Q. Do you use all kinds of bamboo, or some special kinds?

A. We use a special kind of bamboo. This quality of bamboo is found and cut for us especially in Japan. As soon as I found that bamboo had such great advantages over other materials that we had been using I dispatched a man to China and Japan to make investigation and send me samples of all the different qualities of 532 bamboo which he might find there. He went to different parts of China and Japan and sent me about forty different varieties of bamboo in such quantities as to enable me to make a number of lamps of the qualities which were suitable; and from the results of the life-test on these lamps I ascertained which was the best species of the bamboo family for my purpose. He then made further investigation to ascertain the best parties to furnish a continuous supply—bamboo being an industry in Japan, and plantations in certain districts being the principal industry. From that time on I have got my supply of bamboo from the same place. However, I have kept up my search for different qualities of bamboo which might prove better, and also for all kinds of other material. Since 1880 I have sent one man up the Amazon; afterwards another was sent to Uruguay and Paraguay, and up the River De La Platte; and two more men were afterwards sent up the Amazon to near its headwaters; and two other men were sent to the West India Islands, and thence to the north coast of South America, from British Guinea to the United States of Colombia, up the Magdalena river to the headwaters at Honda. Another man was sent down to Mexico. One man just returned the other day from a year's search through Ceylon and India, and I have now a man down in the Cauca valley in the United States of Colombia. In fact, I have, since that date, always had men out searching for vegetable material which had the quality that I desired. Also through numerous correspondents I have received an enormous number of samples. I should say that I have received and carbonized, made into lamps, and tested their enduring qualities, not less than six thousand different species of vegetable growths.

418 Q. How large a proportion of these vegetable growths did you find at all suitable for your purpose?

A. Only about three species of bamboo, and one species of a peculiar cane that grows up in the regions of the Amazon, but of

which I have never been able to procure a supply, owing to
533 the malaria and fevers there; and one or two species of
fibres from the agava family.

419 Q. Out of these vegetable growths that you have found suitable, did you find it possible to use the entire plant, or only particular portions? State what the fact is?

A. Of the bamboo, which we now use, only the extreme outer edge of the cylinder, after the removal of the silicious epidermis, can be used.

420 Q. How large a portion is that of the entire thickness which is suitable?

A. The thickness of the walls of the cylinder is about three-eighths of an inch; and we use twenty-thousandths of this; but the best portion is the first ten-thousandths of an inch from the edge. It is at this point where the fibres are more nearly parallel, and where the cell walls of the fibres are apparently the smallest and where the pithy matter between the fibres is at its minimum.

421 Q. In cutting or forming the filaments from the bamboo or other vegetable fibre, is it necessary that it should be done in any particular way; or will cutting in any way or direction answer the purpose?

A. No; it must be cut parallel with the fibres. We cut them as nearly parallel with the fibres as possible, and then by a system of inspections after the bamboo blank is ready for carbonization, we throw out as far as possible all those slips in which the fibres were not cut parallel. If we did not do this, and should cut so that the fibres at one end did not extend continuously to the other end, but one set of fibres, or rather one or two fibres of the several fibres only extended half way up, where by the cutting tool they ran to a taper, and then to nothing, and nearly joining two similar fibres, running to the other extremity, there would not be a continuous fibre from end to end in the blank. Hence, on carbonization there would be a break between the two fibres, composed of light, porous, and pithy matter; and, after the filament had been carbonized, put in a lamp, and brought up to incandescence, the total weight of carbon
being less at this particular point, and therefore offering a
534 greater resistance to the passage of the current, it would become more highly heated than at the other points, and develop a "spot" as it is called by lamp-makers, and the life of the lamp would be rather short.

422 Q. What would be the effect of attempting to cut a conductor from bamboo, the direction of the cut being at right angles to the length of the fibre?

Counsel for complainant objects to this line of examination in reference to bamboo, as incompetent and irrelevant; and states that this objection would have been entered sooner, but that it was agreed that it might be entered at the end of the examination. Counsel, however, prefers to enter it now, as the examination seems to be an undue waste of time, and entirely irrelevant to the controversy. So much of it as relates to anything done by the witness subsequent to the filing of complainant's application for a patent, is further objected to as incompetent and immaterial.

A. It would be impossible to cut a filament in that way, and even if it could be done I should not imagine that it could be carbonized successfully, or used at all.

423 Q. Referring to an incandescent conductor of the size shown in the patent in suit, what would be the effect of attempting to make a conductor by cutting a piece from vegetable fibre, the cut being at right angles to the fibres and then carbonizing the piece so cut? Would such a carbon have any value in the art in your opinion?

A. If the fibres of the material were all parallel, and they were cut at right angles, of course they would be of no earthly use.

424 Q. Why would such a conductor be of no use?

A. In all vegetable growths formed of fibres, that I have ever seen, the fibres are separated from each other by pithy growths, having a cellular structure enormously greater in size than the cells
535 of the fibres; and the proportionality of carbon which this
light porous matter gives, as to the proportion given by the fibre itself, would be several times less; that is to say, in the bridge between fibre and fibre there would be several times less carbon than in the fibre; and if such a filament could be cut, and if cut could be carbonized, and if carbonized could be put in a lamp, the passage of the current sufficient to render the fibres themselves incandescent, would bring the temperature of the intervening carbon, due to the pith, so extremely high that the lamp would immediately break. It would be like taking a lot of shot, placing them in a row, and cementing them together with mucilage, to make a wire, and using this wire to sustain heavy loads.

425 Q. How far would these defects which result from cutting across the fibres, be present in woods generally?

A. We soon found out in our experiments that filaments could not be successfully made from wood, for two reasons: First, all the woods which grow from the outside have fibres which are not parallel—the parallelism being more or less distorted in different woods by fibres which run towards a centre at right angles to the principal fibres, and which are called, I believe, medullary rays. Wherever these pass, the fibres on each side are bowed to permit these fibres to pass; and as the fibres at right angles are only connected by the other fibres, with pithy matter, we would in a measure obtain a filament from ordinary wood like cutting bamboo at right angles to the fibre. In the mechanical operation of cutting, these small fibres which run at right angles to the principal fibres, would pull out. The fibres of the filament would very seldom be continuous on account of the want of parallelism due to the bowing of the same around the medullary-ray fibres; and all the lamps that we made from this class of material were of no commercial value whatever. The second objection to the woods is that the microscope shows that the cells composing the fibres are of very large dimension—so large that the resulting carbon is very porous

and friable; while in the slips cut from vegetable growths,
536 like bamboo (that grows from the inside and not from the
outside, like wood) the cells are of a very much smaller size, and consequently greater in number; and are greatly incrusted and filled with resinous and other amorphous material, which on carbonization softens, and serve to lock the whole together in a homogeneous mass. There is not sufficient of such material in ordinary woods; and, where the resinous matters are very great, as in the conifers, the most of it distills off as hydrocarbons of the turpine series, and leaves every little asphaltic residuum to lock the carbonacious residuum together.

426 Q. Do the objections which you have spoken of as arising from the presence of the medullary rays apply to all exogenous vegetable growths, or to only a part of them?

. A. I do not remember any exogenous growths that do not have medullary rays.

427 Q. How many of the exogenous woods have you tried for the purpose of making carbon filaments; and how extensively have been your experiments in that direction?

A. When I first started we made filaments of everything that we could get hold of. I think we used as many as thirty or forty different woods of exogenous growth, but soon gave them up as hopeless, for the reasons I have already stated.

428 Q. Would an incandescent lamp having a filament made from wood of exogenous growth be, in your opinion, a practical lamp?

A. Not with any woods that I know of.

429 Q. As I understood you, in speaking of woods you mean exogenous vegetable growths?

A. Yes; that have medullary rays, or right-angle fibres.

430 Q. How did you come to strike the idea of using bamboo?

Objected to by Mr. Kerr as incompetent.

A. We were carbonizing everything that we could get hold
537 of, with the idea of getting a carbon that would have life
under commercial conditions, and also which would give even manufacturing results; that is to say, one where we could make a thousand lamps, and not find that three or four hundred of them were spotted and useless, but an incandescing conductor, which in making a thousand lamps would be so perfect that only a small percentage would be bad and necessitate the uselessness of the lamp. I remember the circumstance about the bamboo. We had an ordinary palm-leaf fan on one of the tables, and I was then investigating everything with a microscope, and I picked that up and found that it had a rim on the outside of bamboo cut from the outer edge, a very long strip. I gave this to one of my assistants and told him to cut it up and get out all the blanks he could from it and carbonize them, and put them in lamps, and run on the light current to ascertain their availability; and we were surprised to find that these lamps were several times better than any we had then succeeded in making. By a microscopic examination and by

other experiments we ascertained the reason why; and I felt so convinced that we had got on the right track that after a short while I dispatched a man to Japan, as I have previously stated.

431 Q. What are the characteristics in bamboo which you have found to make it particularly suitable for your purpose?

A. I have already stated that the characteristic is that the fibres run more nearly parallel in that species of wood than in any other, except in the one instance of this particular reed which I have stated we found up on the Amazon. Owing to this parallelism we are enabled to form a blank by cutting, in which the majority of all the fibres are parallel, and thus produce unspotted lamps; that is to say, lamps which, when brought up to a dull red, show an even degree of color. The contraction of the filament in carbonizing is also more homogeneous, due to the fact that the fibres are parallel and similar in character, and to the immense amount of
538 resin as cellulose present in this species of material, the great advantage of which I have already recited.

432 Q. Is there any generic quality in vegetable fibres, because they are fibrous, which adapts them for the manufacture of carbons for electric lamps?

A. No; certainly not. They are rather a disadvantage. If bamboo grew solid, without fibres, but had the cellular formation just the same, I should consider it absolute perfection; and I have not the slightest doubt but what incandescent lamps would have a life at least six times longer than they have now. What is wanted is a cellular structure, even and homogeneous in every direction, without fibres, but amorphous so to speak; that is to say, the same in all directions; so that on cutting it into shape it will have the same mass per unit section everywhere; and will on carbonization give the same amount of carbon; so that the carbon thus produced will have the same stress, like well-annealed glass, throughout its whole body. The object of the cellular structure is to produce as a whole a filament in which the whole of the carbon is a continuous conductor of electricity, so that the whole of it takes part in performing the work; and by reason of the cellular structure its total resistance as a conductor will be great. Taking such a theoretically perfect filament of carbon (composed of carbon cells, with air spaces in each cell) the amount of investment in copper conductors will be in proportion to the amount of carbon in the filament. If the cells were filled solid, full of carbon, the investment in a station using such a lamp, covering a mile area of the city of New York, would probably be, say two hundred thousand dollars for the copper; whereas, if the cells were not filled solid, the investment would be, say one hundred thousand dollars; yet the economy and life of the lamp would practically be the same. The carbon in the interior of a filament is a positive disadvantage, because it does not give light, and requires a large investment in copper to carry the current necessary to keep it up to such a degree of incandescence as to permit the exterior of the carbon to emit light.

539 433 Q. Do I understand that out of the six thousand kinds of vegetable growths which you say you have tried, that the

three or four which you have mentioned are the only ones having the proper cellular structure to make them suitable for incandescent lighting?

A. No; not exactly that; but none but these three or four that I have stated were sufficiently good for my purpose; that is, the production of a perfect commercial lamp and one easily and cheaply manufactured. Some of the inferior kinds of material could be used; and if, in the manufacture, those which were defective, as shown by bringing them up to a dull red, were thrown out, the residuum would be commercial; but the percentage or good to bad lamps would be so enormously great (that is to say, the proportion of bad lamps would be infinitely greater than the good ones), that the cost would be prohibitory. Out of all these several thousand materials there are remarkably few that are of any value whatsoever.

434 Q. Have all vegetable fibrous growths a suitable cellular structure, with regard to the size and form of the cells, to make them adapted generally for the manufacture of conductors for incandescent lamps?

A. Oh, no. For instance, in pith the cells are so large that it is utterly valueless. It seems, from the experiment, that the smaller the cells the greater will be the life of the conductor.

435 Q. How large a percentage of vegetable growths, in your opinion, would have a cellular structure suitable for the manufacture of carbon filaments, which would make even fairly operative lamps?

A. I am not aware of the existence of an exogenous wood which would answer at all. The endogenous (having parallel fibres) are the only ones that would be of any value; and these are not all capable of use. For instance, take the palm fibres. They seem to be of the same generic family as the fibres composing the bamboo; but the fundamental fibres of the visible fibres (but which can only be seen with a microscope) are very much greater in diameter in the palm than in the bamboo; and the cells of the charcoal are much larger in the palm than in the bamboo; so much so that our tests have shown that filaments cut from apparently perfect palm fibres did not give one-fifth the life as corresponding bamboo fibres. There exists great diversity in endogenous woods in the amount of ash and silica between the fundamental fibres and of the fibre as a whole, or the aggregated fibres; and this seems to produce some result in the chemical action or decomposition which takes place in carbonization. I have never been able to ascertain definitely what effect is produced; but it does produce an effect not desired, I know from experiments.

436 Q. Have you any patents covering the use of bamboo and similar fibres for this purpose which describe the proper way of cutting the material?

Objected to by Mr. Kerr as immaterial and incompetent.

A. Yes; I have a patent on bamboo and similar fibre. It is No. 251,540, of December 27, 1881.

A printed copy of the patent referred to is offered in evidence and marked "Defendant's Exhibit Edison Bamboo Patent, No. 251,540."

437 Q. What other materials besides carbonized fibrous material is used in the manufacture of filaments for commercial incandescent lamps?

A. One manufacturer makes a filament for carbonization by acting on hard-twisted thread with sulphuric acid, to destroy its fibrous texture, and make it amorphous like, and continuously cemented throughout its mass. Another manufacturer takes films of collodiate, cuts blanks for carbonization from the same, reduces the nitric acid from the compound by means of a reducing agent, thus making a non-fibrous structure which gives a very beautiful and perfect carbon filament. If its residuum, which is transparent like glass, was as dense as bamboo, it would be as nearly theoretically perfect, in my mind, as any material that could be used for the purpose. Another maker, I believe, uses a solution of 541 cellulose in sulphuric acid, reduced to a syrupy consistency and squirts it through a die into a chemical liquid which precipitates it as fast as it issues from the die, making a filament for carbonization, non-fibrous, but as the original cellulose can be regenerated, I believe that it does not alter the cells, or destroy its properties, to any great extent. Another maker uses a solution of melassic acid, which he forces through a die. This is purely a chemical compound, artificially made. Another maker I have heard of uses a chemical artificially made, which he squirts through a die into a solution which precipitates it. Other makers use bamboo. I think Sawyer and Man use bamboo or, at least, did so at one time. The Siemens Brothers use the fibre of the agave, which I believe is of the same family as that of the fibre of the bamboo. Other makers have used silk thread, twisted and treated by some chemical means to lock the fibres together, and render it as a whole, non-fibrous, although not to the same extent as the use of collodion films.

The answer is objected to by Mr. Kerr as incompetent.

438 Q. Have you yourself made filaments from other than fibrous material; if so, state the facts?

A. Yes. I have made filaments from chemical combinations, compounds and mixtures, by squirting, by flowing in sheets, by cutting therefrom, and in many other ways.

439 Q. When did you stop using paper in the construction of filaments for your electric lamp?

A. We only made a few hundred paper carbon filaments when we discovered the efficiency of bamboo, and made none after that discovery—that is to say, no paper carbons. We might have made a few, but only for experimental purposes

440 Q. State approximately the date when you adopted bamboo, as nearly as you can now recollect it?

Objected to by Mr. Kerr as immaterial.

542 A. I think about January 30, 1880, or within a month of that.

441 Q. What defects, if any, in paper, caused you to discontinue its use for commercial purposes?

A. It did not give sufficient life; and if it was attempted to make fi*al*ments of high economy, the life was very short. Another difficulty was, that paper is so uneven. In the manufacture of paper, the pulp runs out on the wire cloth very unevenly. The fibres are not perfectly mixed, but some lie more in one direction than in another; and these vary. The paper was not always pure. It was loaded with different things. While the paper, after being calendered, seemed to be of the same thickness—really, before passing it through the calender rolls, it was very uneven in thickness. Passing it through the rolls pressed down the higher parts, and seemed to produce some harm to the texture. Another trouble was the cutting of these blanks from paper. It was very difficult to cut them even. Another defect was the carbonization, as the resulting carbon would be useless since without the tarry matter which comes from the decomposition of the cellulose flowing in between the fibrous, and on carbonizing locking them together, the paper could not be used. But fortunately this tarry matter flowed while exuding from the decomposing cellulose between the fibres, and in carbonizing locked them together. It was enough to prevent cohesion between those kinds of carbons and the carbon of the cellulose. Great care was necessary to be exercised in causing the heat during the act of carbonization to be conducted equally and simultaneously to all parts of the decomposing cellulose, so that no one part should be decomposed before the other, as great contraction took place, and this would make a very unhomogeneous conductor, (carbon being internally under great strain in various directions, like unannealed glass), and it also produces greater or less contraction in different parts of the resultant carbon, so that when put in a lamp and brought up to a red heat, some parts would be a dull red, and others would be a bright yellow, the filaments being destroyed
543 at the hottest part. In fact, at the time that we used paper
we found extreme difficulty in getting a great number of lamps free from spots so that they could be used; but when we got bamboo our troubles practically disappeared, as all these difficulties, or nearly all, were absent when bamboo was used.

442 Q. I call your attention to the original application for the patent in suit, which is contained in the Complainant's Exhibit File-wrapper and Contents. What was there, if anything, known generally in the art at the date of the filing of the application for the patent in suit, which was known as carbonized paper covered with powdered plumbago?

A. I never heard of carbonized paper covered with plumbago being used in the arts.

443 Q. Would the statement contained in that original specification, "We have tried carbonized paper covered with plumbago" be, in your opinion, a sufficient description to enable a person skilled

in the art at the date of the application to make an incandescent conductor, without further experiment?

A. If it is meant that the carbonized paper is rubbed over with plumbago, I think an expert skilled in the art could do it. It is not certain, from the description, if it was to be coated with plumbago before carbonization or after. I should infer that it was meant that carbonized paper was rubbed over with plumbago. I do not exactly see what this would do.

444 Q. Assuming that the statement means to first fill paper, such as blotting paper, with powdered plumbago, and then passing a current through it to carbonize it, do you find a sufficient description in the specification to enable you to make a carbon in that way, without experiment?

Objected to by Mr. Kerr, that the specification speaks for itself.

A. I do not find anything in that specification that elucidates the meaning of the sentence about carbonized paper covered with
plumbago. It does not state in the specification how it is to
544 be used, but I infer that the paper was carbonized and then
rubbed over with powdered plumbago. That is the nearest
meaning that I can come to.

445 Q. In your opinion could a practical carbon for incandescent lamps be made by impregnating paper, such as blotting paper, with powdered plumbago, and then carbonizing it by passing an electric current through it?

A. Do you mean in a vacuum, or how?

446 Q. Either in vacuum, or air, or nitrogen, or illuminating gas.

A. My opinion is that it would require a great stretch of the imagination on the part of any expert skilled in the art, to conceive of a practical filament being made in this way. If you carbonize in vacuum there is never any carbon left in the paper. There is about forty-seven per cent. of carbon in paper, the balance being water, and the oxygen of the water is sufficient to burn up all the carbon.

477 Q. What would you understand by the expression "wood carbon or charcoal" contained in this original specification, considering the same from the standpoint of the knowledge of those generally skilled in the art at the date of the application for the patent?

A. Charcoal from ordinary wood.

448 Q. Does that statement, in your opinion, give any information of value to others skilled in the art, which would enable them to make a practical incandescent lamp?

A. The paragraph states that they have tried three different kinds of carbon, but which is the best they do not state; as and everything depends on the kind of wood from which the wood carbon or charcoal is made, it would of course be necessary to ascertain by experiment the proper kind to use. I think a fuller description of incandescent conductors made from wood carbon or charcoal may be found in some of the earlier foreign patents of ten or fifteen years ago.

449 Q. What do you mean by charcoal from ordinary
545 wood, in your previous answer? Do you make any distinction between the species of the wood?

A. By "ordinary wood" I mean exogenous woods—woods of medullary rays, ordinary domestic woods.

450 Q. Was that the character of the charcoal generally known in the arts as charcoal, at the date of the filing of this specification?

A. Yes, sir.

451 Q. Do you find in this specification, or in the specification of the patent as issued, to which I also call your attention, any statement as to the selection of a particular wood or charcoal having suitable characteristics, or any description of necessary methods of cutting and preparing the fibrous material for carbonization?

A. The patent as issued seems to be very much expanded, in fact it is a somewhat fuller description of what was hinted at in the patent as first filed. I find that the patent of 1885 mentions carbonized paper, and drops the use of powdered plumbago, covering it, and it doesn't give any instructions of what wood to use to obtain the wood carbon, or any details as to precautions necessary to carbonize the same.

452 Q. The question also includes any suggestion as to methods of preparing it for carbonization?

A. I do not see any description either in the first or in the amplified application, explaining the methods of preparing the wood for carbonization.

453 Q. Does the original specification or the patent as issued, in your opinion, contain a sufficient description of the fibrous or textile carbon or original material from which it is made, the methods of preparing for carbonization, and method of carbonization, to enable any person skilled in the art at the date of the filing of the application, to make practical incandescent carbon for electric lamps?

A. The original specification indicates the use of three different incandescent conductors. It doesn't state which is the best. It gives no details as to manufacture, nor does it indicate the kind or quality of the paper or of the wood. It describes no means
546 of putting them in shape for carbonization, nor any means of getting the ordinary gas carbon into shape, and the patent itself gives very little more details; in fact it leaves everything for experiment to determine the materials and operation best suited to produce a practical lamp.

454 Q. Please state specifically whether in your opinion the original specification or the patent as issued contains a sufficient description of the fibrous or textile carbon, its method of preparation, and the selection of material to enable a person skilled in the art to make a practical, fibrous or textile carbon for incandescent lamps?

A. Do you mean now in the present state of the art, or at the time the patent application was filed?

455 Q. I mean at the time the application was filed, and from the standpoint of information of those generally skilled in the art at that time.

A. Of course not. The patent would not indicate anything which has not been already indicated in other patents years before.

456 Q. That is, as I understand you, the patent in suit does not describe any advance in the art over what was before generally known?

Objected to by Mr. Kerr as incompetent.

A. No.

457 Q. Are all kinds of paper suitable for the making of incandescent conductors?

A. No.

458 Q. How many papers have you tried for that purpose?

A. I should say thirty different kinds of papers.

459 Q. What percentage approximately would you consider suitable for even a fairly operative lamp, and what percentage entirely useless for any kind of a lamp?

A. It depends on the maker. Some load their paper with so much China clay that you cannot use it; others make their paper but slightly different from makers of similar qualities of 547 paper; same parchmentize their paper, so as to destroy the fibrous nature of it; some produce a very even texture of paper, and other manufacturers produce very uneven texture, and then try to smooth it down by hard calendering. Paper is a very uncertain thing, and the same manufacturer will vary from time to time in the same brand.

460 Q. Do you know of any paper that would be entirely useless for the purpose?

A. Blotting paper, roofing paper, and glazed paper—that is to say, enameled paper.

461 Q. Do you find any statement in the original specification of the patent in suit, or the patent as issued, which shows how to select the paper for carbonization for the purpose?

A. No; it just says "paper;" that could be determined experimentally.

462 Q. As the art stood at the date of the application in the mind of those generally acquainted with the art at that time, would that have been a sufficient description to enable a proper paper to be selected without experiment?

A. No.

462½ Q. Do you find any statement in the original specification of the patent in suit, or in the patent as issued, which indicates whether the material is to be cut and shaped to size before carbonization or not?

A. There is nothing at all on this subject in the application as filed. In the patent as issued it contains a description somewhat general, saying that the material is conformed to the desired shape and size, and then carbonized when confined in retorts in powdered carbon. It doesn't give any description of how it is to be cut.

463 Q. Is there any description in the original specification, or the patent as issued, with regard to the wood carbon, to show whether it is to be cut lengthwise of or across the fibers?

A. No; it gives no description.

464 Q. Would you consider thin Japanese, dental and rice paper as a suitable material to make an incandescent conductor from?

A. No.

464½ Q. Would it be entirely useless, or only partly so?

548 A. Useless.

465 Q. The complainant's expert, Mr. Pope, takes the position that the mention of the carbonized paper in the original specification is a sufficient statement to enable those skilled in the art to understand that the material is to be cut to size and shape before carbonization. Do you agree with him in this opinion?

A. The original specification calls for carbonized paper covered with plumbago. As it doesn't say whether the plumbago is to be put on the carbonized paper or on the paper before carbonization, I do not see as Mr. Pope's answer is relevant as applied to the original application as filed, while it might be so in the patent as issued; but I differ with him about the implication that it had to be cut to size before carbonization. I do not know that an expert would necessarily do that, because thick carbonized paper of the size implied in the sketch accompanying the application could be cut out of the carbon itself. It is somewhat difficult for me at this late date to know what I would do at the date when the original application of Sawyer-Man was filed. I would probably have shaped it before carbonization, because I was already familiar previous to that date with carbonized paper in connection with incandescent lighting, telephones and their uses. If the patentees did cut the thing to shape before carbonization, why do they not fully set that out in the application so that it would not be requisite to call experts at this date to ascertain that fact?

466 Q. In your opinion, is the statement in the original application that the inventors have tried carbonized paper covered with plumbago any indication to those skilled in the art as to whether the wood carbon or charcoal is to be cut to shape before or after carbonization?

A. No indication that the wood carbon is to be formed out of wood previous to carbonization.

467 Q. Look at the drawings of the patent in suit. What,
549 in your opinion, would be the advantage, if any, in using a
carbon from fibrous or textile material in such a lamp?

A. The lamp shown is one only suitable for working in a series and not in multiple arc. It is constructed to work in a series where large currents are necessary. In lamps of this kind of a system the endeavor is to diminish the resistance of the incandescing conductor as far as possible in contradistinction to multiple-arc systems where the object is to increase the resistance of the incandescing conductor as far as possible. The ordinary gas carbon is suited to the lamp of the patent of 1885 on account of its low resistance. The use of an incandescent conductor of carbonized paper is taking a *contra* direction to what is necessary. This only defeats the great object to be attained—that is to say, low resistance, as the carbon residuum from the carbonization of paper being porous, has per square millimeter a very much greater specific resistance than gas-retort carbons; but of course, if the carbonized paper was not used, but the carbonized paper coated with plumbago or impregnated with plumbago by some means, and carbonized, as is indicated in the application as originally filed, the resistance of the incandescing conductor might be got down quite low and possibly utilized. But using all carbonized paper alone in a lamp of this character, suitable only for a series system, makes the patent very ambiguous, and rationale, taken from a scientific standpoint, would probably puzzle any expert not acquainted with the exigencies of the patentees in amending the application.

468 Q. Would there be any difficulty in making a carbon of the size and shape shown in the patent in suit from a hard-carbon mixture such as Carré used in making his pencils?

A. No difficulty; that would be an easy matter, as their manufacture was well known.

469 Q. Would such a carbon made from a hard-carbon mixture such as Carré used be suitable for a lamp of the construction
550 shown in the patent in suit; and what would be its value in such a lamp compared with the fibrous carbon?

A. It would be better than paper, but not so good as bamboo.

470 Q. Would it be better than ordinary charcoal, such as would be known by the expression "wood carbon or charcoal," at the date of the filing of the application for the patent in suit?

A. My impression is that it would be better than ordinary wood charcoal from domestic woods.

471 Q. How much of a test as to the capacity of an incandescent electric lamp would it be necessary to make in order to arrive at any certain conclusion as to its practical or commercial character?

A. For two or three years, in our test-room at the lamp factory, we were in the habit of checking our experimental results as to the efficiency of any change in the methods of carbonization, or materials, or otherwise, by setting up ten lamps at five times the normal candle power which they would burn in practice to determine the results of such experiments in terms of lamp life; but we found, after an enormous number of experiments, that the results based on such a small number as ten lamps were, in a great many cases, utterly fallacious, and we arrived at the conclusion, by experiments of lamps of definite character (and also mathematically), that no results of an experiment could be predicated upon any less number of lamps on a full test than fifty; and where great certainty was requisite, one hundred lamps are employed by us. For instance, I have now two sets of one hundred lamps each in my laboratory, which have been running, if I remember rightly, nearly a year at normal incandescence, to determine experimentally whether the multiplied factor of lamps set up at five times their normal, is a correct one. To the end that we may reach quicker results, for instance, if it was desired to ascertain the efficiency of a peculiar quality of a new material which some of my men had sent in from outlying countries, we would make up fifty lamps, put them

on a life test at eighty candles (instead of 16, at which they
551 would be used in practice), and we would arrive quickly at
the average life of the whole, because the lamps at this high temperature did not last very long; and we would from the average life of these lamps determine their relative value as compared to another and similar set of lamps made from another material; and also determine what their life would be if run at sixteen candles in place of eighty, from an empirical law which we had established from our experiments. The lamps which I have referred to as set up in my laboratory, and which have been running nearly a year, are to determine the correctness of the formula as to the lasting powers of a lamp at sixteen candles, which would have a given life if set up at eighty candles.

472 Q. Would the fact that a single lamp ran for many hours be even a reasonable indication, in your opinion, that the carbon in the lamp was made of proper material and under the proper conditions for the general manufacture of a commercial lamp?

A No result can be obtained from one lamp. If the average life of one thousand lamps is two thousand hours, and they are all set up at sixteen candles, three or four will be destroyed in the first two hours, and they will follow along one after the other over a period of six thousand or seven thousand hours, but the average of the whole would be, say two thousand hours.

473 Q. What do you understand is the meaning in the art of a "lamp chamber made wholly or entirely of glass and hermetically sealed"?

A. In incandescent lighting it means wholly of glass and all joints in the act of manufacture being sealed by fusing the glass. Hermetically sealed, as applied to the modern art of incandescent lighting has probably a different meaning than when applied to canning fruit and such things. Hermetically sealed means sealed in such a way that it maintains its vacuum continuously for any length of time. I know of no means whereby this hermetical sealing for preserving a continuous vacuum can be done except by a
fusion of the glass, the chamber being made wholly of glass,
552 through which the platinum electrodes having the same
coefficient of expasion, pass. A chamber made wholly of glass might be made in two parts and ground together, but this would not maintain a vacuum, if some wax or similar material was put into the joint in a fruit-jar sense it would be hermetically sealed, but not in the sense applied to modern incandescent lighting, where, owing to the extreme minuteness of the incandescent conductor and the quantity of carbon an extremely stable vacuum must be continuously maintained. It was the very fact that I could not maintain my vacuum which prevented me from continuing the experiments right along in the endeavor to make a multiple-arc lamp with a filament of carbon of high resistance.

In endeavoring to get a high-resistance lamp by the use of platinum, coiled, I arrived at conditions gradually wherein I was enabled to get an enclosing globe entirely of glass, all fused together, through which the platinum wires passed. Arriving at these conditions I resumed experiments on the use of carbon, knowing that I had a chamber which would preserve a vacuum continuously. The old style of obtaining a vacuum was so crude as compared with the modern method that not only could not a sufficient degree of exhaustion of the air be obtained, but even with the exhaustion obtained it was not continuous, owing to the leakage at the joints of the apparatus.

474 Q. What do you mean by the statement that the old means of obtaining a vacuum was so crude as compared with the modern?

A. I mean the mechanical air pump and bell jar, and Gassoit cascade and other devices.

475 Q. As I understand you, then, you did not consider it necessary for the purpose of increasing your information to make further experiments with carbon until you had produceed such a vacuum chamber.

A. No. It was the conditions that I desired; and once I saw that I had reached the conditions experimentally, and had proved that a chamber made entirely of glass, by fusion, through which
553 the platinum wires passed maintained a stable vacuum, I
saw at once that it would be possible to make a lamp of high resistance, from carbon. In my early experiments with platinum lamps, the thing I desired is therein detailed, to wit, a lamp which as a whole would give high resistance when giving the ordinary unit of light, that is, sixteen candles, so as to permit its being used in the multiple-arc system of distribution. I had known for a long time, and knew in 1877, that carbon had the requisite resistance to afford a very simple conductor to accomplish the object; but I also knew in 1877 that it would have to be made hair-like; and as my results showed that carbons which were far from hair-like, but many times larger in bulk approximately, were soon destroyed by my not being able to get sufficient vacuum to maintain the same, I knew that it would be useless to try a filament which would have the qualities I desired under such adverse conditions. But the moment that I had got apparatus and means and methods whereby I made a chamber wholly of glass, and with the McLeod gauge on the Sprengle pump had determined that it held a vacuum continuously, I knew that I could make the hair-like filament permanent, provided the filament itself could be made sufficiently homogeneous.

476 Q. To your knowledge are there any incandescent lamps now sold in which the atmosphere is either of nitrogen or of hydrogen?

A. None sold. The art has so advanced that the experts now know that with an electric current of one horse power, giving eight lamps of sixteen candles each per horse power, when the filament was in a vacuum, the same lamps would not give more than one lamp per horse power, or sixteen candles, when nitrogen was in the globe at the atmospheric pressure; and would give no light at all if hydrogen was in the globe at the atmospheric pressure. In other words, if eight lamps, each giving sixteen candles, run by one horse power of electricity, the chambers of which lamps were highly exhausted (that is to say, a vacuum) and so arranged that hydrogen

554 could be let into each of the chambers, so that the same should be at atmospheric pressure, and then sealed, the filament would go down to a dull red, and practically give no light at all, the whole of the heat being carried to the chamber, and radiated by conduction and convection, and not by radiation as in a vacuum. It is a most absurd thing to use nitrogen or hydrogen.

The further examination of the witness is adjourned to March 7th, 1889, at 11 a. m., at the same place.

CONSOLIDATED ELECTRIC LIGHT COMPANY
against
McKEESPORT LIGHT COMPANY.

ORANGE, N. J., *March* 7, 1889.

Met pursuant to adjournment.

Present: Messrs. Walter K. Griffin and Richard N. Dyer, for defendant, and Mr. Thomas B. Kerr, for complainant.

The witness, THOMAS A. EDISON, being further examined by Mr. DYER, testifies as follows:

477 Q. Referring to figure 5 of the patent in suit, do you consider that it would be practically possible or feasible to secure a glass plate *y* to the flange *x* by the fusion of the two glass parts together? Please state your reason for any opinion you may express.

A. I suppose that it would be possible, as an illustration of how expert a glass-blower may be in the manipulation of glass; but I do not think it would be capable of being brought to a commercial operation. If it were to be done, of course it would not be 555 necessary to grind the two faces perfectly together; and if intended to be sealed by fusion of the glass of course it would be made different than as shown in the patent. But taking the figure 5 of the patent as the real size, it would be rather difficult, and the difficulty would increase with the increase in the size of the lamp. I do not see how the metal tubes which pass through the two holes in the glass plate *y* could be sealed in very well, except they were of platinum (which I do not understand they were), and even if they were of platinum, my impression is that owing to their great size they would crack the plate on cooling. Of course if the lamp had ever been intended to be sealed by fusing the glass together it would not by any possible stretch of imagination have been made as set forth in figure 5.

478 Q. Again calling your attention to figure 5 of the patent in suit, and also calling you- attention to the Sawyer-Man patent No. 205,144, to which reference is made in the patent in suit, and which explains how the metal tubes are to be closed by the metal caps screwed over their ends, please state whether or not in your opinion a lamp chamber could be closed in this way so as to maintain a vacuum which would be suitable for a practical incandescent lamp?

A. No, this is a ground joint seal. The caps as shown in figure

5 would have to contain some unctious substance, the same as described in their patents, to maintain a vacuum for an hour even.

479 Q. Even by using the unctious or other sealing substance, would the caps in your judgment be capable of maintaining a suitable vacuum?

A. I have testified several times that chambers in which it is proposed to maintain a vacuum, made of two parts ground together, with or without some cement or mobile substance, will not maintain a continuous vacuum, and is not a hermetical sealing which meets the requirements of the modern incandescent lamp. Such chambers will not hold a vacuum. Such lamps will not be useful, or commercially made with such chambers. I know of no such lamps which were ever commercial or which were ever introduced; 556 and I do not think there is any such lamp now being made, sold, or used, with chambers of this character, with the air exhausted therefrom. This answer will cover any of the chambers or devices shown in the patents of Sawyer and Man, 205,144 and 317,676.

480 Q. Please state approximately, if you know, when the complainant, The Consolidated Electric Light Company, began the business of incandescent electric lighting?

A. I am not very familiar with the various organizations through which the Consolidated Company was formed; but if I remember rightly they bought or consolidated with a company called the American Electric Light Company, whose technical department (that is to say, the making of lamps) was conducted by experts taken from my factory and laboratory; and if my memory serves me rightly it was these experiments which started the lamp factory of the Consolidated Company, and I think they went into the business for the sale of lamps about a year and a half or two years after we had started in the business.

Mr. Kerr objects to the last sentence of the answer as incompetent.

481 Q. What company do you refer to as starting in the lamp business a year and a half or two years after your company had started to make and sell lamps?

A. I refer to the Consolidated Company, which had acquired the American Company.

482 Q. Have you ever examined any of the lamps made by the Consolidated Company? If so, please state when, and also state the result of your examination with regard to the construction of the lamps?

Objected to by Mr. Kerr as incompetent and immaterial.

A. I have examined the lamps sold by the Consolidated Company, which lamps were known as Sawyer-Man lamps. They were almost precisely the same as our own lamps. The carbon filament 557 was made of bamboo, which fact I ascertained from a microscopic examination. The only difference in the carbon was that it was "flashed" by the deposition of carbon on the surface of the original filament. I think this examination took place about two years or two years and a half ago.

483 Q. How many lamps did you examine at that time?

A. About three.

484 Q. How were the lamp chambers of those lamps constructed?

A. The chamber was made entirely of glass, by the joints being fused, and the small platinum wire sealed in the glass, and passing into the chamber, just as is shown in my patent No. 223,898.

485 Q. What was the condition of the art of electric lighting when you commenced your experiments; and what generally was the advance made by you in such art—excluding any considerations as to the quality and production of suitable carbons. Please state this so that the court can understand the adjuncts necessary to a successful lamp in order to produce a complete system of electric lighting?

A. In 1878, when I took up actively the subject of electric lighting, no apparatus had been devised, so far as I know, that would in any measure fulfill the conditions which I thought would be necessary to make electric light suitable for the illumination of interiors. In that year was begun the introduction in Paris of the Jablochkoff candle, and a year or so later the introduction of the arc lamp was begun in this country. These electric lights were of large candle power, each unit being of several hundred candles, and I did not think them suitable for general interior illumination. The subdivision of the electric light into small units comparable with that of the ordinary gas jet was what I thought was required. The general scientific opinion was that this could not be done. Even after it had been announced in the public press in 1879, that it had been accomplished by me, the statement was discredited and was pronounced by many eminent scientific men, both in
558 this country and abroad, to be an impossibility. A committee was appointed by the English Parliament to examine into the general subject, and they called before them as witnesses nearly all of the prominent scientific men in England, all of whom, with the single exception of Mr. Tyndall, testified that, in their opinion, the subdivision of the electric light was an impossibility. Mr. Tyndall said he would hardly go as far as that—he would not say it was impossible, but he would not like to undertake the solution of the problem.

It is true that incandescent electric lamps had been proposed more than a quarter of a century previous to my taking the subject up, but no material advance had been made in their production, and the correct principle upon which to build them had not been, so far as I know, discovered. Not only had no incandescent lamp been made that was capable of practical use, but the conditions of use of a practical lamp had not been predetermined, nor had any comprehensive system been devised, whereby practical lamps of small unit candle power could be used to supplant gas as a general illuminant. It was not only necessary that the lamps should give light and the dynamos generate current, but the lamps must be adapted to the current of the dynamos, and the dynamos must be constructed to give the character of current required by the lamps, and likewise all parts of the system must be constructed with reference to all other parts, since, in one sense, all the parts form one machine, the connections between the parts being electrical instead of mechanical. Like any other machine, the failure of one part to co-operate properly with the other part disorganizes the whole and renders it inoperative for the purpose intended.

The problem then that I undertook to solve was stated generally, the production of the multifarious apparatus, methods and devices, each adapted for use with every other, and all forming a comprehensive system whereby electricity, properly controlled and directed, could be distributed over large areas through the streets of a city,
and supplied to houses in which it would feed incandescent
559 electric lamps of moderate candle power, which would be
entirely under the control of the householder, the whole to be on the same scale as the present system of gas distribution and affording the same character of convenience to the users.

The first thing necessary to be done was to adopt a fundamentally correct system of distributing the electric current and then to devise which could be worked practically on such a system—that would be practical and satisfactory both in a commercial and scientific sense. The essentials of a comprehensive system of electric illumination, similar to the general plan of illumination by gas, were a network of conductors all connected together, so that in a city area the lights could be fed with electricity from several directions, thus eliminating the disturbances to any particular section.

Second. To devise an electric lamp which would give about the same amount of light as the gas jet, which custom had proved was a suitable and useful unit, and which should possess the qualities necessitated by small investment, in the copper conductors. It was also necessary that each lamp should be independent of every other lamp, although on the same circuit. That the light should be produced sufficiently economically to commercially compete with gas. That the lamp should be durable, and capable of being handled by the public, and cheap to manufacture, and one that would remain incandescent and stable a great length of time.

Third. It was also necessary to devise means whereby the amount of light furnished a consumer could be accurately determined, as in the case of a gas meter—and that this should be done cheaply and reliably.

Fourth. I had also to devise a system of conductors capable of being placed underground or overhead, and which would allow of being tapped at intervals, speaking generally, about the width of each house facing the street—so that service wires could be run
from the main conductor into each house, as gas pipes run
560 from gas mains, and generally whatever was necessary to
such a comprehensive system of distribution as the system I had in view required. Where the conductors were to be placed underground, which I contemplated doing in large cities, it was necessary to devise a system of protective pipes for the copper con-

ductors, which would allow of their being tapped wherever required; also manholes, junction boxes, connections, and the various parap-ernalia of a complete system for underground general distribution.

Fifth. I had also to devise means of producing at all points, and on an extended area of distribution, a practically even pressure analogous to gas, so that all of the lights should give an equal light at all times and independent of the number that might be in use. I had also to devise means for regulating, at the point where the current was generated, the equality of the pressure of the current throughout the whole lighting area, also a means of indicating what the pressure was at the various points of the area.

Sixth. I had also to devise economical dynamo machines for the conversion of steam power into electricity, means for connecting, disconnecting, working and regulating the same: means for equalizing their loads; means for regulating the number of machines to be used to the demands on the station for electricity from the users of the light. The arranging of complete stations, with steam power and electric apparatus, and devices of all kinds to suit the varying conditions of buildings available for such stations in cities.

Seventh. I had also to devise devices which would prevent the current used from becoming excessive upon any conductors and causing fire or other injury, switches whereby the current could be turned on or off at such points as it was desirable that this should be done, lamp-holders, electric chandeliers and the like. I had also to devise means and methods for placing the wires that were to convey the current to the chandeliers in buildings.

561 I set out to found an entirely new industry and art. My system contemplated the generation of electric current on a very large scale, and its distribution throughout an extended area, and the division and subdivision of the current into small units converted into light at innumerable points in every possible direction from the point of its generation. Nothing of this character had ever been undertaken before, and the accomplishment of this result presented at almost every point problems of the utmost difficulty, the solution of which was not suggested by anything that had gone before in the art, but required a great amount of experiment and labor.

486 Q. What, in general, was the history of the commercial introduction of the Edison system of electric lighting?

A. I entered into relations with the Edison Electric Light Company in the fall of the year 1878, under an agreement by which I was to perfect the system I had in contemplation. I had at the time a large laboratory and a machine shop at Menlo Park, New Jersey. I immediately increased the working force in my laboratory and machine shop, employing mathematicians and scientists as well as the best mechanical skill, and I commenced experimenting on an extended scale, having at one time upwards of one hundred men engaged upon various branches of the experimental work. In December, 1879, I gave a public exhibition at Menlo Park of my system, lighting up the grounds and buildings with my carbon filament lamps, which I had then brought to what I considered commercial perfection.

By reason of the obstacles which are usually met with in an establishment of an entirely new art, the introduction of my apparatus proceeded slowly at first. The company did more or less business in the way of selling isolating plants for lighting single buildings, but it was not until the fall of 1882 that a complete central station was in operation. This plant was a great undertaking for an initial plant. Its conductors were designed to supply current to 16,000 lamps. They were laid underground in the streets in the lower part of New York city, and extended through all the streets
562 of district about one mile square, bounded on the east by the
East river, on the south by Wall street, on the west by Nassau street, and on the north by Spruce street, Ferry street, and Peck slip. The engines and dynamos for generating the current were located in a building on Pearl street. The first cost of this plant was in the neighborhood of $600,000. Since the erection of the first central station plant a large number have been installed by the Edison Light Company and its agents.

487 Q. What, if anything, did you do in the way of establishing factories for the manufacture of your electric lighting apparatus?

A. There were no established factories at the time which could undertake the manufacture of the apparatus. The necessity of establishing factories, together with the inventing and devising of the numerous tools and methods of manufacture, and the education of men in the manufacture of new character of apparatus, was a cause of great delay in the introduction of my system. The experimental work had been carried on in my laboratory and machine shop at Menlo Park until 1880, when I established works for making lamps. I had to establish these works, as it would have been impossible for me to have had the lamps made in any established factory, nor was there any skilled class of labor which could have made such lamps without my personal instruction or the instruction of my assistants. Shortly after the establishment of my lamp factory I caused the establishment of Bergmann & Co., for the manufacture of lamp sockets, meters, switches, safety catches, and the various small parts required in electric light plants, as well as chandeliers, brackets, and other forms of fixtures for supporting the lamps. These could not have been made in the general market for the reasons previously stated. Shortly afterward the Edison machine works was established for manufacturing dynamo machines. This factory I had to establish for the same reasons as above stated. I also formed the Electric Tube works, which
563 has since become amalgamated with the Edison machine
works for manufacturing underground conductors. These factories I put up largely at my own expense, investing all the moneys I had made from my previous inventions, and to-day I own a controlling interest in them. I established them because the business could not have been developed without them, and placed over each, as general superintendent, gentlemen who had been con-

nected with me in my laboratory, and who were familiar with the patented devices of my system.

488 Q. Did you or the Edison Electric Light Company have any trouble in finding skilled men to install these central station plants?

A. As I have said the art was an entirely new one. This made it necessary that men should be specially educated in it. There were no body of skilled artisans from which the company could draw. All the work had to be done at first under the direct supervision of myself and my laboratory assistants, who had acquired a knowledge of the inventions and apparatus used in my system during the course of my experimental work. In the installation of the first central station plant in New York city I was almost constantly present, giving my entire time to the work day and night. I had to give it careful and constant supervision. In illustration of what I say, I will state that I actually worked in trenches in the streets in the lower part of the city, in which the conductors were being laid, making many of the connections myself.

After the first station had been built the public were to form companies and install my system. The great difficulty was in getting men to do the work. There were not then, as now, electrical engineers who were familiar with my work and who could be employed for the actual construction of a central station. The art was new and men had to be educated and I had to educate them. I was compelled to form a construction department and personally undertake the construction and installation of central station plants in cases where my company had made contracts for the erection 564 of plants. I gave this construction department my personal attention, giving up my experimental work to a great degree. I gathered around me a body of men whom I instructed in the details of my system. In the shops I established training departments, so that the men I employed could become familiar with the apparatus that was to be used and generally familiar with all arrangements of the business, to the end that they might become able to superintend the installation of plants. I expended some $54,000 of my own money in educating men in my construction department and in my shops, so as to develop the company's business, for which I have never received the slightest return. Many of the persons whom I instructed, after they had acquired knowledge of my system, left my employ and used the knowledge they had acquired against my interest and the interests of my company.

Counsel for complainant objects to so much of the deposition of this witness as relates to the manufacture and sale of lamps subsequent to the date of the application for the patents in suit, or subsequent to the date when the witness or the Edison Electric Light Company had notice of the rights of Sawyer-Man, as incompetent and immaterial. Counsel also makes the same objection to the answers to questions 485, 486, 487 and 488. These objections are entered at this point in the examination by agreement of counsel, and are here made for the purpose of saving interruption and loss of time during the progress of the examination.

Cross-examination by Mr. KERR (without waiver of objection):

488 X Q. When was the Edison Electric Light Company formed?

A. I see by looking at a copy of the certificate of incorporation that the company was incorporated —— —, 1878.

565 489 X Q. How soon after the formation of the company did you begin your work on incandescent lamps, which you speak of as having resulted in the production of a successful lamp?

A. I was experimenting on devising a system of electric lighting before the company was formed, and continued these experiments right along until I had reached a successful lamp.

490 X Q. What facilities, as to men, money and apparatus, did you have in connection with your lamp-work at that time?

A. What time?

491 X Q. The time referred to in the last answer?

A. I said that I had experimented to devise a system of electric lighting before the Edison Electric Light Company was formed, but did not state any time.

492 X Q. My question referred particularly to your work after the formation of the company. I repeat the question with that understanding. What facilities as to men, money and apparatus, did you have in connection with your lamp-work at that time?

A. I had a laboratory at Menlo Park; I had sufficient money for all experimental purposes, but the facilities were gradually augmented after the formation of the company until I had all that was required.

493 X Q. My question also involved men?

A. I had all the men that I required.

494 X Q. Please name some of the men you had assisting you in those experiments?

A. Charles Batchelor, Francis R. Upton, Francis Jehl, John Kruesi, Martin Force, W. J. Hammer, Ludwig Boehm, Crosby and others.

495 X Q. Were you limited in any way as to expenditures, or the employment of men, or the purchase of apparatus, or any other thing that might be of advantage in your work?

A. No, not after the formation of the company.

496 X Q. Please give me the names of the persons who constituted the company?

A. The incorporators, as shown by the certificates, were—.

566 497 X Q. What relation did Mr. Lowrey have to the company during the year 1879?

A. He was a director, and, I believe, the counsel of the company.

498 X Q. What was the capital of the company?

A. I think the first capital was $300,000.

499 X Q. If it was subsequently increased, please state that fact, and also what, and as near as you can when, the increase was?

A. I remember that it was afterwards increased to, I think, $700,000, and then again to $1,500,000. I have no means of refreshing my recollection, and cannot give the dates when these increases took place. I did not pay much attention to that branch of the subject.

500 X Q. What was the par value of that stock?

A. $100.

501 X Q. Do you know what its market value in 1880, 1881 and 1882 was?

A. I considered the intrinsic value to be about $500 a share. The market value was very variable. I did not sell any of my own stock, and therefore cannot state the prices at which sales were made, except from hearsay.

502 X Q. Isn't it a fact that it went up to about $1,250 a share during that time?

A. My information was that it sold for that.

503 X Q. Who were the financial agents of the company during 1879 and up to 1883. I mean the bankers?

A. I don't remember who the bankers were. The firm of Drexel, Morgan & Co. were interested as stockholders, and one of the members of the firm was a director.

504 X Q. I wish you would just give his name?

A. Egisto P. Fabri. I don't think they were the bankers.

505 X Q. What variety of bamboo is it that you say you use in the manufacture of lamp carbons?

A. A variety which grows and is extensively cultivated in Japan for artistic purposes.

567 506 X Q. I wish that you would give the name of the variety, and from what part of Japan it comes, so that it may be identified?

A. I think the name of the quality which is the best is called Matake. It is, however, the same quality as is used in Japanese art work, having a very polished yellow surface. Flexible screens, lattice-like, put together with thread, and sold in Japanese art stores in New York, are made of the character of bamboo that we use.

507 X Q. Referring now to the patent in suit. Do I understand you that it would be impossible to make a lamp, such as is shown and described there, and fill it with nitrogen gas, that would be a practical lamp?

A. Yes, for commercial purposes.

508 X Q. What is necessary to fit a lamp for commercial purposes—I mean what qualities?

A. That it should be sufficiently economical, in the production of light, to permit of competition with gas, when an equivalent amount of light from an electric light can be sold for 50 per cent. more than the same amount of light by gas; it also must be cheap—that is to say, the lamp must be cheap to manufacture; simple, not liable to get out of order; the filament should last a considerable length of time; and generally have such characteristics as would permit the use of a moderate investment in the distributing system in streets and houses upon which it is to be worked. The use of nitrogen, at atmospheric pressure, would permit the use of the carbon conductor in a lamp longer than in a vacuum, as the tendency to leakage through the joints would not be so great. But, on the other hand, the employment of this means brings in a factor as disadvantageous, commercially speaking, almost as the shortened life of the conductor due to an unstable vacuum. As I have already testified, under these conditions of burning in nitrogen gas at atmospheric pressure, we would obtain only about one-eighth as much light from any incandescent conductor as would be obtained from the same in high *vacuo* with the same amount of electricity.

568 509 X Q. Could you take the patent in suit, make a lamp like it, fill it with nitrogen gas, and, by the application of a proper current, bring the carbon to incandescence?

A. Yes, sir.

510 X Q. Could you make such a lamp last for a day?

A. I don't think so.

511 X Q. Do you think it would be impossible?

A. It would depend upon the degree of incandescence. If brought up to the same degree of incandescence as the ordinary incandescent lamp now used, I do not think it would last a day.

512 X Q. What do you mean by the ordinary incandescence of a lamp?

A. I mean the regular incandescent lamp now sold throughout the country as under my patent 223,898.

513 X Q. What is the candle power?

A. A degree of incandescence of about 240 candles per electrical horse power.

514 X Q. Suppose such a lamp to be burned at 25-candle power, do you think you could make one which would last for a day?

A. Not at the specific incandescence of 240 candles per horse power.

515 X Q. I have called your attention to the lamp shown by the patent in suit. Please state whether you think it is impossible to make a lamp like that, having a burner composed of fibrous or textile carbon, which would burn, at the brilliance of an ordinary incandescent lamp of the present day, for a period of 24 hours?

A. I do not believe it could be made to do so.

516 X Q. I now show you a printed book entitled "In the United States Patent Office. Edison *vs.* Maxim *vs.* Swan. Interference. Electric lamps. Testimony in behalf of Edison." Please state whether you testified in that interference case, and whether your deposition appears on pages 1 to 13 and pages 164 to 252?

A. Yes, sir.

569 517 X Q. Do you know that this is the paper book containing the printed testimony on your behalf in that interference?

A. It appears to be. I have no doubt but what it is.

The examiner is requested to mark the paper book for identification as "Complainant's Exhibit Edison, Maxim and Swan Interference Record." The examiner does so.

The exhibit is objected to by counsel for the defendant as being incompetent and irrelevant, and as being only a part of a record.

Redirect examination by Mr. DYER:

518 Re-D. Q. In what sense, if at all, in your opinion, would the lamp described and illustrated in the patent in suit be practical when constructed with the general knowledge of the art as it existed at the date of the application, namely, January 9, 1880?

A. It would not be a practical lamp at the time of the filing of the application. Neither would it be a practical lamp if made according to the amended specification and the drawings; and I have testified that, if made according to the specifications and drawings, it is not a practical lamp now.

519 Re-D. Q. To what extent would such a lamp be capable of use if constructed with the general knowledge of the art as it existed at the date of the application?

A. No use.

520 Re-X. Q. Has the general knowledge of the state of the art materially increased since the date of the filing of the application of the patent in suit?

A. Yes, sir; the general appreciation of the problems inherent in the practical part of the art has been greatly acquired by experts since the application in question.

Recross-examination by Mr. KERR:

570 521 Re-X Q. State whether an incandescing conductor for an incandescent electric lamp, composed of carbonized fibrous or textile material, and of an arch or horseshoe shape, is a practical thing.

A. It depends on the nature of the material from which the incandescent conductor is made, and the conditions under which the same is worked.

522 Re-X Q. Suppose that material to be paper?

A. It depends on the kind of paper, the method of carbonizing, and the conditions under which it works.

523 Re-X Q. Those things all given, namely, a proper kind of paper, proper carbonization, and proper conditions under which it is worked, such a conductor would be a practical and operative thing, would it not?

A. It would be a relatively practical success as compared with bamboo; but in one sense, that is to say, for competing purposes, it could not compete with bamboo for the selling of light from lamps constructed as stated. The lamps, in their manufacture, would be under the disadvantage that not as many given lamps from a given lot can be obtained from the use of paper as from the use of a more perfect material such as bamboo, and the life of the lamps would not be so great as those containing bamboo.

524 Re-X Q. You did not know that fact on January 9, 1880, did you?

A. No, I did not. The paper lamp was the best one we had at that time when made in quantities, although I might have tried experiments on other material which showed in one or two cases better than paper. I don't remember now, as I have not read over my previous testimony, and it is so many years ago that I have a very indistinct recollection and would not be able to answer this question accurately without refreshing my memory by reading over testimony I have already given and looking at my original sketches.

525 Re-X Q. Was your first bamboo lamp as perfect as the lamp you now make?

A. No, not quite so perfect.

526 Re-X Q. There has been an advance then in that particular with yourself, has there not?

A. Yes, sir; we are enabled, by careful manipulation in
571 the various processess in the factory, to produce lamps which,
as a whole, are much better than we were able to make, producing the same number in 1880, although some of the 1880 lamps were far superior to some of the lamps now made from the same material.

527 Re-X Q. You are constantly improving the character of your lamps, are you not?

A. Yes, sir; constantly improving on the details of manufacture so as to ensure the production of a greater number of lamps in which defects are absent.

528 Re-X Q. You are also improving their efficiency, are you not?

A. The efficiency is improved by the perfecting of the details of manufacture.

529 Re-X Q. Isn't it a fact that the art of manufacturing incandescent lamps is constantly improving?

A. The art of manufacturing is constantly improving in the sense that in a lot of 100 lamps there will be a less number broken in the first hundred hours than in a lot of 100 made the year previous.

530 Re-X Q. And also that there will be a greater number of good lamps?

A. Yes, sir.

531 Re-X Q. Is the combination of an electric circuit, and an incandescing conductor of carbonized fibrous material included in and forming part of said circuit, and a transparent hermetically sealed chamber in which the conductor is enclosed, a practical and operative combination?

A If the incandescent conductor of textile or fibrous material is a good one and made from proper material and properly carbonized and properly exhausted, and the chamber is absolutely hermetically sealed by the fusion of the glass so that the whole of the chamber shall be made of glass through which the platinum wires are sealed, and the vacuum is high and stable, such a lamp would be, if included in an electric circuit, a commercial success.

532 Re-X Q. If you had made such a lamp and had found that the conductor was destroyed by reason of defective sealing of the chamber, what would you have done?
572 A. I would have done just as I did in my patent 223,898,

make the chamber entirely of glass by fusion—hermetically seal it in reality and not in name.

533 Re-X Q. In short, you would have made the sealing perfect, would you not?

A. Yes, sir.

534 Re-X Q. That would be the obvious thing to do, would it not?

A. Not obvious, no. It took me a long while to reach, by experimentation, the condition which caused me to appreciate that fact.

535 Re-X Q. My question supposed that you appreciated the fact that the sealing of the lamp was defective. Having appreciated that fact, was it not the obvious thing to do to make that sealing perfect?

A. I appreciated the fact that the method shown in the patent of the complainant was defective, but I did not appreciate the fact until I had experimentally determined that the only possible means whereby a continuously stable vacuum could be obtained was by the use of a chamber made entirely of glass; and when this became certain to my knowledge I applied for the patent No. 223,898.

536 Re-X Q. I didn't say anything about the complainant's patent. My question supposed a lamp having an electric circuit, an incandescent conductor of carbonized fibrous material included in and forming part of the circuit, and a transparent hermetically sealed chamber in which the conductor was enclosed, and the appreciation of the fact on your part that the sealing of such a lamp was defective, and I asked you whether it was not the obvious thing to do for you to make that sealing perfect. Now, was it not?

A. Your question implies that it was hermetically sealed. If it was hermetically sealed there would have been no use of fusion; but in point of fact such lamps as are implied by your question are not hermetically sealed. It was not obvious at the time—at least it was not to me—that by fusion of the glass such a chamber would maintain a stable vacuum. Such things are never obvious. 573 For instance, the telephone and the phonograph—two excessively simple things, performing great results—were not obvious to men skilled in the art, who knew all the conditions necessary to produce such instruments. In science those things which are the most simple and most conspicuous seem to be hidden the longest. Their very conspicuousness seems to hide them.

537 Re-X Q. We will omit the word "hermetically," and I call your attention to the fact that I said nothing about "fusion," and I ask you whether, given such a lamp, the sealing of which was defective, was it not the obvious thing to do to make that sealing perfect?

A. I don't know what would be obvious to other people. It was not obvious to me until I had reached that point, and when I did reach the point and got results I applied for a patent in which I claimed the conditions of an incandescing conductor in a chamber made wholly of glass, as claimed and shown in my patent 223,898.

538 Re-X Q. Please state whether an incandescing electric lamp, consisting of an illuminating chamber made wholly of glass, her-

metically sealed, and out of which all carbon-consuming gas has been exhausted or driven, an electric circuit conductor passing through the glass wall of such chamber, and hermetically sealed therein, an illuminating conductor in said circuit and forming a part thereof, within such chamber, consisting of carbon made from a fibrous or textile material having the form of an arch or loop, is a practicable and operative thing?

A. If the carbon is a good one, and the chamber is made entirely of glass, through which platinum wires, or wires having the same coefficient expansion as the glass, are sealed, and from which the air is exhausted, and if placed in an electric circuit, such lamp would be a practical lamp.

539 Re-X Q. Your bamboo carbon is a fibrous carbon, is it not?

A. Yes, sir.

574 540 Re-X Q. It has an arch or loop shape, has it not?

A. Yes, sir.

(Signed) THOMAS A. EDISON.

Sworn to before me—
[L. S.] WILLIAM FARNHAM,
Special Examiner and Notary Public.

MARCH 7*th*, 1889.

CHARLES BATCHELOR, being duly sworn, testifies as follows:

The same stipulation is entered into in regard to the testimony of the witness, Charles Batchelor, in the interference proceeding in the U. S. Patent Office, between Sawyer & Man and Thomas A. Edison, as appears of record in regard to the deposition of Thomas A. Edison; and the examiner is requested to copy said deposition as part of this examination, and the deposition is accordingly entered as follows:

The following is Mr. Batchelor's testimony in the interference case:

CHARLES BATCHELOR, a witness produced in behalf of Mr. Edison, testified on oath as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence, and occupation?

A. Name, Charles Batchelor; age, 35; residence, Menlo Park, New Jersey; occupation, assistant to Mr. Edison.

2 Q. Please state how long you have been an assistant to Mr. Edison, and what your particular labors and duties have been in that capacity?

575 A. I have been assistant to Mr. Edison for nearly eleven years. My occupation has been entirely, during the last eight or nine years, the receiving of ideas and sketches, and afterwards carrying them out; making the necessary instruments myself, or with any help that I required. I have had general charge of all Mr. Edison's experiments during that time under himself.

3 Q. If you know of experiments of Mr. Edison's in 1876, in the carbonization of paper, please state about the same, somewhat in detail?

A. I remember some experiments in carbonization of paper in the summer or fall of 1876, in which paper carbon was made by him and myself for resistances, battery carbons, and other things that were to be sold by a company called the Novelty Company. I remember carbonizing strips of paper in pieces of gas tube, also sheets of paper in an old cast-iron box which we had laying around his laboratory. I do not remember what kinds of paper was used, with the exception that I remember carbonizing a number of sheets of tissue paper. The other papers were a variety of papers that were lying around the laboratory at the time. I also remember that we carbonized there paper called bristol-board, besides a number of different kinds of wood.

4 Q. How extensive and long-continued were these experiments in the carbonization of paper?

A. They were not very long-continued. I believe the experiments lasted not longer than a fortnight, as far as the Novelty Company was concerned. My impression is that I carbonized paper later than those experiments for our own use in the laboratory.

5 Q. Had you proceeded before the end of 1876 in the carbonization of paper, so far that nothing more was needed in the way of information with regard to the proper carbonization, *per se*, of paper?

A. The experiments of 1876, of which I speak, answered their purpose as far as I am aware, the papers being properly carbonized. I believe we required to learn no more on carbonization for that purpose.

6 Q. During the time mentioned had you put such carbonized paper in electrical circuits?

576 A. Yes, sir; as some strips were intended for resistances, we had measured their resistance to see what variation there was in the carbonizing. I do not remember what resistance the carbon strips were, as we had no particular size for them.

7 Q. State, if you please, the next experiments you remember of as made under Mr. Edison's direction with carbonized paper.

A. The next experiment that I remember was the use of carbonized paper in telephones. I have found a paper which refreshes my memory on that point, which is dated July 20th, 1877, and about that time we used carbonized paper in telephones for contact points and diaphragms. The next experiment with carbonized paper that I can remember is the cutting of strips of carbonized paper and putting them into the lamp on the table here, marked Edison's Exhibit First Incandescent Lamp. I believe the strips were cut from carbonized paper that had been carbonized by us in 1876, and I believe I put them in the lamp about August or September, 1877.

Question and answer objected to in so far as it relates to the lamp marked Edison's Exhibit First Incandescent Lamp, or in so far as it has any reference to electric lighting by incandescence with paper carbons, as going to prove that the invention was made and used previous to the time alleged in Mr. Edison's preliminary statement.

Papers referred to in the previous answer is put in evidence, and marked Edison's Exhibit No. 14.

Exhibit objected to as immaterial.

8 Q. When did Mr. Edison first begin to experiment in lighting by electricity, to the best of your knowledge, recollection or belief?

Objected to as calling for the mere belief of the witness, which is not evidence.

577 A. I know that Mr. Edison has frequently made experiments in electric lighting previous to the time I put the paper carbon in the lamp marked Edison's Exhibit First Incandescent Lamp, but I cannot tell just exactly what those experiments were. He had been experimenting for about a day on electric lighting previous to his telling me to put this paper carbon in the globe of this exhibit at that time. I find by a record book of Mr. Kruesi's, which is now in evidence, and marked Edison's Exhibit No. 12, which I believe to be true, that he did some work on an electric lamp in January, 1877. This, no doubt, was under my direction, but I have no memoranda to recall to my mind what the experiment was.

9 Q. What is the earliest experiment, to your knowledge, which Mr. Edison made with paper-carbon conductors in an incandescent electric lamp?

A. The earliest experiment that I remember is the one in which I put the paper carbons in the lamp marked Edison's Exhibit First Incandescent Lamp.

Answer objected to as intended to prove that the invention was made before the date stated in the preliminary statement.

10 Q. Please give in detail the history of the construction or fitting up of Edison's Exhibit First Incandescent Lamp, so far as you know about it?

Objected to on the ground that it is intended to prove that the invention was made previous to the date stated in the preliminary statement.

A. The instrument marked Edison's Exhibit First Incandescent Lamp, was originally a philosophical instrument, bought by Mr. Edison for his laboratory, and is called, I believe, a Gassiot tube or cascade, and was intended to show the discharge of electricity *in vacuo*. It had been in the laboratory, I believe, since 1875. It was made into an incandescent lamp by myself, at the request of Mr. Edison, in the summer or fall of 1877, he at that time wishing to try 578 some experiments on incandescent carbon for lighting purposes. I put on this instrument two binding posts, and also had made two clamps, which I put onto the ends of the rods inside the globe. At first Mr. Edison wanted a hard carbon piece put into the globe, but as I had great difficulty in making it small enough, and getting it in, he suggested that I should cut the carbon from carbonized paper, of which we had a quantity in the laboratory at the time. I did so, and succeeded in giving him a few of the carbons in the lamp. I do not believe the lamp has been used for any other experiments since that time.

11 Q. Please explain how you got the paper carbons into the lamp and held them in position there?

Same objection as before.

A. It was a very difficult and tedious process to put the carbon in there, but I did it by unscrewing the ball from the top of the rod, and also unscrewing the globe from the holder above the cock; also unscrewing the cock from the base; also unscrewing the packing cap. When these are all apart the top rod will drop out and the bottom rod can be left in the part having the cock. The carbon was now screwed to the clamp of the bottom rod whilst lying on the table. The other clamp was then screwed to the other end of the carbon, and all three together lifted and turned, so that the part having the cock would be topmost. The lamp was also turned upside down, and the rods and carbon carefully dropped through it. The top rod was then held until the packing and packing cap were put on, when the whole was screwed together again, and the ball replaced. The binding posts were put on the lamp to hold the connection wires from the battery.

12 Q. Please to state whether or not, after the carbon conductor was thus placed in position, the air was exhausted from the globe of the lamp; and if so, by what means.

Same objection as before.

579 A. After putting a carbon into the lamp, the lamp was placed on the plate of an ordinary air pump, and the bulb exhausted as well as we could do it with that pump. The current of electricity was then applied to the carbon, and heated the same for some short time.

13 Q. Was the carbon brought up to a point of incondescence in the lamp?

Same objection as before.

A. Yes; the lamp did give light for a short time in each case.

14 Q. Please to state, if you remember, how numerous those experiments were?

Same objection.

A. I cannot remember just the exact number I put in, but believe there were at least four.

15 Q. Do you remember from what kind of paper those paper carbons were made?

Same objection.

A. I cannot be sure what they were made from, as I did not make them at the time for the experiment. I remember I took a carbon sheet that was thin compared with others we had, but what kind of paper it was I do not know.

16 Q. Do you remember what was the size of the strips of carbon paper with which you experimented in that lamp?

Same objection.

A. I had no particular size given me by Mr. Edison, and I do not think I measured them, but should judge I made them three-quarters or an inch long and about a sixteenth wide. The thickness of the paper, I believe, was about seven or eight thousandths.

580 17 Q. Did you give this lamp to Mr. Edison to be filed by him as an exhibit with his testimony in this case?

Same objection.

A. No, sir; I may have been the means of calling his attention to the lamp, because I told him I was sure that he had tried incandescent carbon paper previous to the boron and silicon experiments.

18 Q. Who found the lamp previous to its being put in as an exhibit in this case?

Same objection.

A. I do not know who brought the lamp in here. The lamp has never been lost, for it has been lying around the laboratory, generally in full view, ever since the experiment of putting the carbon in it.

19 Q. Were there many other exhibits in the laboratory at the same time?

Objected to as immaterial.

A. There are and have been hundreds of such instruments in Edison's laboratory—relics of old experiments.

20 Q. How do you know that this Exhibit First Incandescent Lamp was made and experimented with, using paper-carbon conductors, at the time you have testified?

Objected to as going to show that the invention was made previous to the date given in the preliminary statement.

A. I can only approximate the date of the putting in of the paper carbon from a paper in evidence marked Edison's Exhibit No. 13, which is dated October 5th, 1877, witnessed by me on or about that date, and in which silicon is used between two electrodes for incandescent lighting, and I know that the experiment on in-
581 candescent paper carbon, in the lamp marked Edison's Exhibit First Incandescent Lamp, was at least from one to three months before that.

21 Q. Is that recollection further strengthened by inspection of Edison's Exhibits Nos. 4 and 5?

Same objection.

A. It is, for I remember from them that we hoped at that time to get better and more stable results than we had previously got from paper.

22 Q. Referring to these Exhibits 4 and 5, state whether or not your signature upon the same is in your own handwriting, and, if so, when was it made.

A. I recognize my signatures on both of these papers, and know that they were put on there by me, on or about the dates marked on the exhibits.

23 Q. After the experiments with paper-carbon conductors with Edison's Exhibit First Incandescent Lamp, what was the reason of making experiments with boron and silicon, and the other metals named in the Exhibits 4, 5, and 13?

Objected to as immaterial.

A. Mr. Edison hoped to get from them a more durable and unoxidizable substance than carbon for electric lighting.

24 Q. Referring again to Edison's Exhibit No. 13, please to explain what is shown and described in that exhibit?

Objected to as incompetent. That must appear by the exhibit itself.

A. Fig. 1, on Edison's Exhibit No. 13, shows three incandescent electric lamps, in which the light-giving substance is silicon, each placed around resistance in the line, so that only a portion of the current goes through the silicon, and the whole fed with electricity from a magneto machine.

582 The figure directly under this No. 1 shows three incandescent electric lamps, similar to the three in No. 1, but placed in multiple arc, each one with its own resistance.

The bottom figure on this exhibit shows the same three lamps, I presume, although the word "silicon" is not there, and these three lamps are all placed in series. In all three cases the electricity is furnished by a magneto machine.

25 Q. Please make a similar explanation of Edison's Exhibit No. 4.

A. In Edison's Exhibit No. 4, figure 1 shows four of such lamps in multiple arc, and figure 2 shows three of such lamps in series, and an explanation is here made to show that other substances could be used besides silicon, as Mr. Edison has remarked on it that he has tried a number of other things, and suggests the better method of working either boron or silicon. He also suggests on this, mixtures of non-conductors and semi-conductors, in order to get a greater resistance when using low-resistance materials.

26 Q. After the experiments described by you with Edison's Exhibit First Incandescent Lamp, what were Mr. Edison's next experiments with carbonized paper for electric lamps?

A. The next experiments that I remember in carbonizing paper for electric lamps were a series of experiments he had me make in order to get a good and light carbon for a lamp which was to be worked on a partial incandescence. I made a great many carbons about August and September, 1878, a great many of which were made from paper. Some of these carbons, especially the smaller ones, were raised to incandescence in an exhausted bell jar of an air pump about that time. I believe I worked altogether, about that time, equal to about two months' ordinary daily working.

Answer objected to upon the ground that it related to experiments made and carbonized paper burnt for electric lighting previous to the date alleged by Mr. Edison in his preliminary statement.

583 27 Q. What were the size and the form of the paper-carbon conductors used in these last-named experiments?

A. The thin ones were generally short—from two to three inches; the thick ones were sometimes as long as six inches; I believe I made as many as from fifty to seventy-five of the paper carbons, which ranged in diameter from three-sixteenths of an inch down to considerably below a thirty-second of an inch. It was difficult to get the small ones very long. The best method I found of making these carbons was to coat tissue paper, or very thin paper, with a mixture of tar and lamp-black, and then roll them up on a flat plate very tightly.

28 Q. Have you any recollection of applying these paper carbons to a lamp such as shown in Mr. Edison's patent No. 224,329—if so, at about what time was that?

A. I do not remember a lamp similar to that shown in the patent referred to being made, except similar in principle. I made a lamp the same in principle as these, which I have found a portion of, in which one of these paper carbons was placed directly over six platinum points and guided in its descent by an upright arm, having a projection on it, with a hole through which the carbon could slip. I believe this lamp was used with three points and six points. The lamp was both an incandescent and an arc lamp—a slight arc forming between the points and the carbon. I cannot exactly tell the date of this lamp. I believe it was previous to Mr. Upton's coming with us in the laboratory, which I think was in November, 1878. I produce a portion of this lamp, showing the base, and the six springs and holders screwed thereon, but the platina points have been taken out.

Portion of the lamp placed in testimony and marked Edison's Exhibit No. 15.

Answer and exhibit objected to as immaterial, and as referring to a lamp that is not an incandescent lamp, in the sense that 584 that expression is used in the application for the patent in interference, but is an incandescent lamp in which the illuminating carbon or electrode is being continually consumed.

29 Q. Was this lamp, Edison's Exhibit No. 15, put in electric circuit and the paper carbon heated to incandescence?

A. Yes, sir.

30 Q. In this lamp, just referred to, was provision made to keep a constant electric continuity?

A. Yes, sir; the fact that the carbon conductor stood directly above the platinum or iridium points and was free to fall by gravity, kept it always in contact with the points.

31 Q. Were other experiments made at about this time by Mr. Edison, or under his direction, in connection with incandescent electric lights?

A. Yes, sir; at that time Mr. Edison was almost entirely occupied with incandescent electric lights. Mr. Edison about this time commmenced the improvement of apparatus for getting a good vacuum. He was also experimenting at the time for the best dynamo-electric machine that could possibly be got. He was also endeavoring to get a lamp of high resistance from metals, such as platinum, nickel, iron and alloys of platinum-iridium. These experiments on the perfection of vacuum apparatus extended far into 1879.

32 Q. During that time also, namely, the latter portion of 1878 were not experiments going on on incandescent paper-carbon conductors, *in vacuo?*

A. I have mentioned that we made experiments in August or September, wherein we placed paper carbons, made by myself, in a vacuum, and raised them to incandescence by the electric current in the bell receiver of the pump. To the best of my recollection, after these experiments were tried, Mr. Edison's attention was turned more particularly to the getting of this lamp of high resistance, which he required, from metals instead of carbon; this he succeeded in doing to a great state of perfection; but in doing so he
585 had been able to get an apparatus for making a vacuum which was far superior to anything we had had before; and it occurred to him that, with such a vacuum, carbon, however small, should be able to stand without oxidizing, which it had always done before.

33 Q. Please examine Exhibit Edison's Commercial Incandescent Electric Lamp, and state when lamps of that description were first made by Mr. Edison?

A. The lamp marked Edison's Commercial Incandescent Electric Lamp is one of a number of lamps made in October or November, 1879, and lamps of this description were first made about the middle of October, 1879.

34 Q. What kind of a lamp is this exhibit you have just testified about?

A. It is composed of a hermetically sealed globe, wholly of glass, through which two platinum wires project on the inside, and to which is clamped a carbon conductor made of paper carbonized. This globe is exhausted of air.

35 Q. When did Mr. Edison first produce an incandescent electric lamp with a carbonized paper conductor, in all respects complete and able to compete successfully with illuminating gas for light-giving purposes?

A. I believe about the middle of October, 1879, when he produced lamps similar to this lamp marked Edison's Commercial Incandescent Electric Lamp?

36 Q. At the date named, what progress had been made in gen-

erators, apparatus for producing vacuum, regulating apparatus, a system for lighting districts, and other matters and things essential for a commercial light for general use in cities and towns?

A. At this time everything was ready, to the best of my belief, and was only waiting for the perfection of the lamp to make the whole system a success, as directly we got the lamp we, in the shortest possible time, exhibited just such a system to the public, that being previous to Christmas day, 1879.

37 Q. Please to give a summary in a connected way, mentioning dates, as far as possible, of the progress of the invention of incandescent conductors for electric lights made of carbonized paper, from the beginning up to the completion of the commercial lamp? 586

Question objected to in so far as it may be intended to bring out anything appertaining to the electric lighting by incandescence with the experiments on carbonized paper previous to the date of the invention alleged in the preliminary statement of Mr. Edison in this interference.

A. The history of electric lighting by incandescence with paper carbon by Mr. Edison, as far as I know it, is as follows: In the summer of 1877 he used strips of paper carbonized as an incandescent conductor *in vacuo*, and the lamp in which they were used is now in evidence and marked Exhibit Edison's First Incandescent Lamp. I should have said here that I remember Edison, within a day or two previous to this lamp being made, using carbonized paper as an incandescent conductor between two electrodes of a battery, but in the open air. The next experiment, or series of experiments, that I call to mind are the ones which I have before spoken of as being made in August or September, 1878. At this time my whole time and attention began to be devoted to development of his system of incandescent electric lighting. These paper carbons were made by coating thin papers with lamp-black and tar, and rolling up tightly into a rod, drying and carbonizing the same in a suitable furnace. Some of these paper carbons were put in between the two electrodes in an electric circuit, and raised to incandescence in a vacuum. At this time carbons made of paper were not the only things that we tried as incandescent conductors in a vacuum. We made many experiments with hard carbons, wood carbons, and some metals, such as platinum, nickel and iron. It had early been decided by Mr. Edison that the requisite material for his incandescent lamp should have a great resistance combined with the least possible surface, and I remember 587 well that at this time and previous we used to expect that we should be able to get a substance for an incandescent conductor that would give us at least 500 ohms resistance. The result of this latter series of experiments *in vacuo* had shown us that in order to get a high resistance lamp from carbon in any form, it would have to be cut in an exceedingly fine filament. The paper carbons which we tried were larger than we should have to use if we wanted a higher resistance. With the vacuum we then got, and which

we considered at that time to be good, the carbons lasted at the most from 10 to 15 minutes in a state of incandescence. The experiments on platinum led us to hope that it might be easier to get a high resistance from that metal than from carbon. From the date of the finishing of these experiments, which, I believe, was towards the latter end of October, '78, Mr. Edison turned his attention to lamps in which the incandescing conductors were formed of metals and alloys of metals. During the last part of the year '78 and up to October, 1879, I made, at Mr. Edison's request, a very large number of lamps having platinum and platinum-irid*ui*m composing the incandescent conductor. A great many of these lamps had their conductors coated with insulating material, in order to be able to wind them up close and get them into as small a space as possible in order to offer the least radiating surface. Mr. Edison very frequently sat down at my table and worked for hours helping me on these experiments. Our conversation frequently was directed to getting the highest resistance in the least possible space. I remember once or twice during these conversations, early in 1879, he remarked how easy it would be to get this resistance if carbon was only stable. During the time that I was experimenting on these lamps he had been busy experimenting to perfect the different apparatus composing his electric lighting system as a whole. I had also worked on these matters, but as our lamp was an exceedingly difficult job, the majority of my time, both night and day, with the exception of a week or two in which I devoted some time
588 to telephones, was spent on the lamp. He had succeeded in making a more perfect dynamo machine. In testing the lamps with platinum conductors he had been continually improving the apparatus for exhausting the globes. In October, 1879, when he had got a very perfect vacuum for his lamps, he suggested the use again of carbonized paper as a conductor, and accordingly he had me cut a fine filament of paper, which we carbonized and put in a globe. This filament, I believe, was cut straight from paper and bent round previous to putting in the carbonizing chamber. I do not remember what we did with this lamp afterwards; but within a day or so of that I cut a loop from paper similar in shape to the one now in Edison's commercial incandescent electric lamp. At the same time that these were being tried, I also made lamps of loops of carbonized thread, carbonized flax, fine filaments of lamp-black and tar rolled up and baked, and, also, threads which had been treated with lamp-black and tar previous to carbonization. All these things were used about the same time as incandescent conductors in electric lamps, the most satisfactory at the time being the carbonized paper loop, which I had cut by hand. We immediately after this made a steel mould in which these loops could be cut quickly, and after a few experiments in the carbonization of them, in order to get their resistance as near as possible alike after carbonization, we made a number of these filaments and used them at an exhibition in Mr. Edison's house, about the 2d or 3d of December, 1879. When the first lamp was made which had a fine filamentary carbonized-paper conductor from which the light was

given, which was about October 22d, 1879, then, I believe, we had a system of electric lighting that was complete and could compete with gas, and we proceeded as expeditiously as possible to exhibit it as such.

38 Q. Did you start a record of the life of the early lamps put in position at Menlo park, and, if so, is Edison's Exhibit No. 3 a transcript of the first fifteen pages of that record?

589 A. I started a record about January 2d, but at that time a number of the lamps had been burning on exhibition for some time, and I remember, on looking at Book 67, that as I did not know the exact time at which these lamps were put up, I allowed as near as possible for the time they had burnt. This is shown on page 1, where lamp 142 is recorded by me on January 2d, 1880, and after marking its resistance I remarked that it has burned at least 200 hours. I have compared the exhibit referred to with the book and see no variation.

39 Q. Please examine Note Book No. 74. State whether you commenced said record and had it continued under your charge. State whether or not Edison's Exhibit No. 11 is a correct transcript from said note book.

A. I have examined Book 74, and I find it is a continuation of the record of lamps commenced by me on January 2d, 1880, and was continued under my direction through Book 74. The exhibit No. 11, as far as I can see, is a correct copy of the pages mentioned in the exhibit.

40 Q. Please state whether or not such records state the facts correctly?

A. They do. I was always very particular to have this attended to in a proper manner. It was the duty of Mr. Herrick to enter in these books their time, as they burnt, daily, and I believe that he did so. I was also very particular to have him mark down in the book the cause of their ceasing to burn; and if at any time he was not present when a lamp ceased to burn, it was generally made a note of by any one in the laboratory present, and put on Mr. Herrick's desk, so that he could go, take out the lamp and examine it, noting its defects.

41 Q. Have you read the testimony of Sawyer & Man in this interference, and if so, have you carbonized paper in the various modes described by them?

A. I have read the testimony and have made some samples of of carbonized blotting paper in the same manner that is described in their testimony.

42 Q. Please produce such specimens, describing what each one is.

590 A. I here produce specimens of ordinary blotting paper carbonized, which were carbonized in a square iron box filled with powdered charcoal. This carbonization was done in an ordinary fire.

Specimens referred to put in evidence and marked Edison's Exhibit No. 16.

I also produce a piece of carbonized blotting paper, the paper having been pressed before carbonization, as stated in answer to question 22 in Albon Man's testimony.

Said specimen is put in evidence and marked Edison's Exhibit No. 17.

I also produce a specimen—two sheets of ordinary blotting paper cemented and pressed together, as also stated in answer to question 22 of Albon Man's examination-in-chief.

Specimen put in evidence and marked Edison's Exhibit No. 18.

I also produce a specimen of several sheets of blotting paper cemented together without pressure and carbonized, which may be meant in answer 22 in Albon Man's examination-in chief. All these specimens were carbonized in an iron box, packed in powdered charcoal and heated in an ordinary fire.

Specimen referred to put in evidence and marked Edison's Exhibit No. 19.

I also produce a number of sheets of blotting paper in which two or more are cemented together and carbonized, the cement being different in this case from the former ones.

Specimen put in evidence and marked Edison's Exhibit No. 20.

591 43 Q. Have you also carbonized paper in the manner described in your testimony as having been done by Mr. Edison and under his direction, in the earlier experiments?

A. I have carbonized also some samples of tissue paper similar to the experiments on carbonization of paper that I have testified to as being in 1876, and here produce the same.

Carbons put in evidence and marked Edison's Exhibit No. 21.

I have also carbonized some samples of strips of bristol-board, which I also remember are like the ones carbonized in gas-pipe tubes in the experiments of 1876.

Samples put in evidence and marked Edison's Exhibit No. 22.

44 Q. Where a paper-carbon conductor has been recarbonized and treated with the electrical current in a hydrocarbon bath, as testified to by Albon Man in answer to 67th cross-question, if such a conductor is heated to incandescence in an electric lamp, what part of the conductor produces the light?

A. As the light from an incandescent conductor is all given off at its surface, and as the experiments which my experience has tried have shown that the treatment of an incandescent conductor in a hydrocarbon bath deposits carbon from the hydrocarbon on its surface and in the interstices, I believe that all the light would be radiated from the deposited carbon.

Counsel for Edison rests his examination of this witness here, and offers him for cross-examination.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer & Man:

45 X Q. The papers you say you carbonized in pieces of
592 gas tube in the summer of 1876; please to state in detail just
how you carbonized the paper in the gas tubes?

A. A piece of tube was taken, such as is used for gas pipes. To the *the* best of my recollection from five to six inches long and having about three quarters to an inch hole in it. A thread was cut on each end of this, and a screw-cap fitted on each end. One end of this tube was completely closed by the cap being fitted tight on it. The other screwed on and off easily. The strips of paper that were carbonized in this tube were cut into lengths, and put lengthwise in the tube, in which some powdered charcoal had been placed and the tube was then packed full of powdered charcoal. In screwing the cap on to this we generally put a little moist clay on the thread to make it air tight. There was more than one tube made for this purpose. I remember one smaller than this. I cannot give the exact size of the smaller one, but believe it was a piece of three-eighths pipe.

46 X Q. How many pieces of your piping did you have fitted in that way for carbonizing paper?

A. I can only call to mind at present the two mentioned.

47 X Q. What kinds of paper did you carbonize in these tubes?

A. Principally stiff papers, such as bristol-board. We also carbonized other kinds of papers, but I do not know that they were carbonized in these tubes.

48 X Q How much paper did you carbonize in these tubes?

A. I cannot say how much paper was carbonized in these tubes, as all the work that I did on this carbonizing was generally done at night. Mr. Edison and Mr. Adams being there in the daytime, also carbonized, I presume, with the same tubes.

49 X Q. How did you heat the tubes?

A. We put them into a common fire and heated them red hot,
and allowed them to cool again before taking the carbons out.

593 50 X Q. How long did you keep them red hot before tak-
ing them out of the fire?

A. I cannot say just how long; sometimes two or three hours. In some of my experiments I took them out of the fire red hot, and covered them up with ashes, so that they would take a long time to cool off.

51 X Q. These paper carbons that were made in the gas tubes, how long were they, how wide, and how thick after being carbonized?

A. I do not remember that we cut them any particular size. The ones that I carbonized were generally about three and a half to four inches long, about three-eighths of an inch wide, and the thickness of ordinary bristol-board. I do not believe that I ever measured this bristol-board for thickness, but believe it was about the thickness of an ordinary visiting card. This was the size, as near as I can recollect, when they were put in.

52 X Q. How many pieces of paper did you put in at one time?

A. I put no specified number each time, but I believe I sometimes had as many as six in the large one.

53 X Q. What were these paper carbons used for?

A. As far as I was concerned, they were specimens of carbonizing. Mr. Edison and Adams, I believe, tested them for resistance and used them as such. I do not remember making any instrument myself in which these were used as resistances.

54 X Q. Did you see Mr. Edison use them as resistances in any instrument, and if so, what instrument?

A. I had seen Mr. Edison testing their resistance with a Bradley galvanometer. Previous to this I had made for Mr. Edison resistances of powdered carbon; also resistances of plumbago on wood. At the time of these carbonizing experiments the majority of my time was taken up in New York, and the experimenting that I did on this was at night.

55 X Q. I asked you if you had seen Mr. Edison use any of the carbons carbonized in the gas tube as resistances in any instrument, and if so, what instrument? 594

A. I simply saw him measure one or two of these carbons, and in those cases they were resistances in an instrument when being measured.

56 X Q. Well, what instrument were they used in?

A. The Bradley galvanometer.

57 X Q. Did you see them used in any other machine; if so, what?

A. I do not remember seeing him use them as special resistances for other experiments, but know that they were carbonized with a view towards getting carbons for resistances, as I believe that was one of the things we proposed to give to the Novelty Company.

58 X Q. Was any practical use made of these carbons, and if so, what; I am referring to the carbons made in the gas tubes all the time.

A. I do not remember that there was any practical use made of these special carbons, as the experiments were never carried far enough to make an instrument from them suitable for the Novelty Company to sell.

59 X Q. Did you undertake these experiments in carbonizing paper in the gas tubes upon the request of Mr. Edison?

A. I did, although I was not working at them all my time. I believe Mr. Adams carbonized and carried on the experiments more than I did.

60 X Q. But you initiated the experiments, as I understand you?

A. No, sir. Mr. Edison commenced the experiments and we simply helped to carry them out. If I remember right, the stoppage of the Novelty Company for want of funds stopped these experiments for them.

61 X Q. When you undertook these experiments or commenced to assist Mr. Edison in making them, did he explain to you his object in carbonizing paper?

A. I believe I remember that in conversation with myself and

Adams on the things that should be given to the Novelty Company, when he mentioned the different articles to be made from carbon he then said that we could get any resistance we wanted
595 from paper carbonized. We had been using previous to that resistances for cable-work which had been made of carbon, but which did not keep their resistances well, as they were made from powdered carbon packed in tubes. A cheap and high resistance carbon was a desideratum for cable experiments, if it could be made constant. This, I believe, was Mr. Edison's idea when he proposed to have the Novelty Company sell resistances which were made of carbonized paper.

62 X Q. These paper carbons which you say you made with a gas tube, were any of them considered commercially salable for the purposes you have mentioned?

A. As the experiments were never carried to such an extent that we had a standard instrument made of these carbonized paper strips, I do not consider that they were a commercially salable article.

63 X Q. Can you produce any of the carbonized paper made by you in the gas tubes in the experiments about which you have testified?

A. I cannot; to my knowledge, for a year or so after these carbonizing experiments, I believe, there were some of these strips carbonized in gas tubes lying around the laboratory, but I cannot say whether there are any there now.

64 X Q. Have you, upon your examination-in-chief, produced any specimens of carbonized paper made in a gas tube similar to those about which you have testified?

A. I have produced and put in evidence strips of carbon paper which have been carbonized in substan*stan*tially the same manner as those described as being carbonized in a gas tube. These strips, however, were carbonized in a small iron box with the cover luted on, and not screwed on as in the tube experiments. This was heated in a boiler fire. This method is substantially the same as the gas-tube experiments.

65 X Q. Which one of the exhibits contains the carbons referred to in your last answer?

A. That marked Edison's Exhibit No. 22.

596 66 X Q. What kind of papers are these carbons made of—Exhibit 22?

A. These paper carbons are made from what is known as bristol-board.

67 X Q. And they were made in an iron box, and not in a section of gas tube, as I understand you?

A. Yes, as I had not a section of the gas tube. A section of the gas tube would probably have made me a more perfect carbon, as the screwing of the cover on is less likely to allow air into the chamber than the mere luting of it up.

68 X Q. How big was the box in which you made these carbons, Exhibit 22?

A. The box was somewhere about five inches long, about two inches wide, but about four inches deep. The box was filled to within an inch of the top with powdered charcoal previous to my putting these card-board strips in. I used this box simply because I had it. If I had had to make a box, I should have preferred the gas tube, in order to make the experiment the same as in 1876.

69 X Q. How many paper strips did you put into the box when you made this Exhibit 22?

A. I did not count the number of paper carbons in the exhibit, but I think they are all there that I put in, in the form of paper.

70 X Q. Then these were all made at once as I understand you?

A. Yes.

71 X Q. After you had the strips of paper put in the box on the pulverized carbon, did you cover the strips with pulverized carbon also?

A. Yes, sir; pressing down the carbon, so as to get in as much as possible and as tight as possible.

72 X Q. Did the lid of the box screw down on it, or how was it fastened on?

A. The box lid had a projection on its under surface that extended into the box about an eighth of an inch. We took moistened clay and plastered all around the projection, and then pressed it to its place carefully. The moistened clay filled the crevice all around the box. It was not screwed or otherwise fastened down. 597

73 X Q. Was the lid of the box held simply by the clay?

A. The lid of the box does not depend on the clay to be held, as we kept it in one position, and it stayed there by its own weight.

74 X Q. Then, as I understand you, the only pressure there was upon the powdered charcoal and the strips of paper in the box was that due to the weight of the lid of the box?

A. Yes.

75 X Q. In making these carbons, Exhibit 22, was it your intention to show just the quality of paper carbon you made in the gas tubes in the summer of 1876?

A. My intention was to show paper carbons made in a similar manner, and with the same material, as those we made in the summer of 1876, in the gas tube.

76 X Q. Why didn't you make them in exactly the same way that you did in 1876?

A. I should have done so if I had had time.

77 X Q. When did you make these, Exhibit 22?

A. Early this morning; between half past twelve and three o'clock.

78 X Q. For the purpose of this examination?

A. Yes, sir.

79 X Q. How do these carbons, Exhibit 22, compare in quality with those you made in the gas tube in the summer of 1876?

A. I can only tell from their appearance. As near as I can recollect, they are very similar in appearance.

80 X Q. Were those you made in the gas tube as entirely unbroken as these are?

A. As far as I can remember, they were as unbroken as these.

81 X Q. Now, that we have got through with the carbons made in the gas tube, and the carbons of Exhibit 22, I call your attention to the sheets of paper carbon you made in an old cast-iron box that was laying around the laboratory in 1876. Please to give
598 the several dimensions of that box, as near as you can recollect them?

A. As near as I can recollect, the size of the box named was about five inches in diameter, and about two inches deep; the box was circular; there was no regular cover to this box, but we used a piece of sheet iron.

82 X Q. How large were the sheets of paper that you carbonized in that box, and what kind of paper was it?

A. I remember only two kinds of paper that I ever carbonized in that box myself, and they were tissue paper and card-board. I believe many other kinds were carbonized, but do not remember doing it myself. The size of the sheets I should judge was not more than about three inches by two or thereabouts.

83 X Q. What you believe is not evidence. Please to confine your answers to what you know and what you remember, and state, if you please, how you charged the box, and how much paper you put in in each charge, and how often you charged it?

A. It is impossible for me to remember at this late date without anything to refresh my memory, exactly how many times I charged the box, or how many papers I put in each box, or in what way I charged each box. I can only say that the experiments I tried for Mr. Edison with this particular box were those in which he required me to get a flat paper carbon after carbonization. The box sometimes had the bottom covered with powdered charcoal, and then a paper sheet. Afterward another layer of powdered charcoal, and then another paper sheet. This was continued for a number of sheets in some experiments. In other experiments fewer sheets were put in, and a weight of iron placed on the top to keep them straight.

I tried a number of devices, and finally succeeded in bringing out flat carbons by putting a heavy weight on top of the successive layers of card-board and powdered charcoal.

84 X Q. Having the box thus charged, and forced down
599 by a weight, in what kind of furnace did you heat it?

A. Sometimes it was heated in a stove; at other times in a small boiler furnace.

85 X Q. Were the carbons thus made straight flat sheets, or were they more or less crooked?

A. The carbons in some of the experiments were exceedingly crooked. The problem was, with me, how to make them come out straight. I succeeded in this by putting heavy weights on them, and leaving the weights on until they were cold.

86 X Q. And then were the carbon sheets whole, or were they more or less fractured?

A. There was no difficulty, that I remember, with the breaking of the carbons. Sometimes some would be broken in taking them out.

87 X Q. What proportion of all the carbons which you made in this box were straight and perfect?

A. Only a small proportion of the carbons that I made myself in this box were straight and unbroken, but when I left off experimenting with that box I could bring out almost all the papers I put in as straight and perfect carbons.

88 X Q. And was this perfection of the carbons, referred to by you, in your last answer, due, in your opinion, to a sufficient weight upon them, and to uniform heating and cooling of them?

A. When I spoke of the perfection of the carbon in that last answer, I meant its perfection of form and shape, unbroken. There was no effort at uniformity on my part at that time to get uniform heating other than from an ordinary fire, but I frequently endeavored to get uniformity of cooling by covering it over with the ashes of the grate.

89 X Q. These sheets of paper carbon that you at last succeeded in getting straight and whole, of what kind of paper were they made?

A. I believe, principally, of ordinary card-board.

90 X Q. Card-board is of various thickness. State about how thick the card-board was that you used to make these carbons, as near as you can recollect.

600 A. About the thickness of an ordinary visiting card.

91 X Q. What use did Mr. Edison make of these sheets of carbon you made in this box in 1876?

A. I do not remember any use that they were put to; as well as I can remember the flatness of the carbons was requisite for making carbons for batteries, and in order to make the generality of battery carbons we should have to have larger molds and larger sheets; the experiments, I remember, resulted merely in getting flat sheets of carbon from paper.

92 X Q. Can you produce any specimens of the carbons made in this box in 1876?

A. I cannot; I have looked in Edison's laboratory for some specimens of these paper carbons, but although I can find plenty of carbonized paper, I could not bring any here that I could swear was carbonized by us in 1876.

93 X Q. Have you produced here to-day any specimens of carbonized paper intended to show the quality of the carbonized paper you made in that box in 1876, other than these contained in Exhibit 22?

A. Yes, sir; I have put in evidence here some carbonized tissue sheets which are marked Edison's Exhibit 21, which are substantially similar to some tissue sheets that I carbonized in the iron box in 1876.

94 X Q. Are these carbons of Exhibit 21 carbonized in the same box that the carbons of Exhibit 22 were carbonized in, and in the same way and at the same time?

A. They were carbonized in the same box, but not at the same time; they were carbonized in the same manner, between eleven o'clock the night of July 7th and three o'clock the morning of July 8th, 1881.

95 X Q. Are these carbons of Exhibit 21 suitable carbons out of which to make illuminating conductors for Mr. Edison's incandescent electric lamp?

A. No, sir.

96 X Q. The same question as to the carbons of Exhibit 22?

A. I cannot say, as I have not tried them.

97 X Q. What is your opinion about it?

601 A. My opinion is that the carbons in Exhibit 22, if used as incandescent conductors in an electric lamp, would answer that purpose; as the carbonizing we do now for Edison's electric lamps is no different in principle from the way in which we carbonized the strips in 1876.

98 X Q. What time in the year 1876 did you commence these experiments of carbonizing paper, about which you have been testifying?

A. I cannot give the exact date, as I have no memoranda to refresh my memory; the particular year, 1876, I remember, as during that year I spent a great part of my time in New York selling and perfecting the manufacture of Edison's electric pen; it was about the time of the organization of the Novelty Company.

99 X Q. At the time these experiments were made what reference did they have to electric lighting?

A. I know of none.

100 X Q. Referring now to the exhibit marked Edison's First Incandescent Lamp, please to state whether the lamp is now in the same condition it was when you made the experiment in it about which you have testified?

A. As far as I can see, it is in the same condition as when I put the paper carbons in for Mr. Edison.

101 X Q. These experiments, as I understand you, with this lamp, were undertaken by you at the request of Mr. Edison in the latter part of the summer or the early part of the fall of 1877?

A. Yes, sir.

102 X Q. When Mr. Edison requested you to undertake these experiments, what did he say to you?

A. As near as I can recollect his words were: "Batch., put me a piece of carbon in this," and I believe he brought the globe to me at the time.

103 X Q. Is that all he said to you upon the subject of the experiment at the time—did he say nothing about the object of the experiment?

A. At that particular time that was all that I remember; but when I had finished the instrument, and was making a thin
602 carbon to put in, and he saw the difficulty I had to get it thin enough, he suggested to me to cut the carbon from some of the carbonized paper that was lying around. I do not remember that he said anything to me at that time about the object of the experiment. It was quite apparent to me what he wanted to do.

104 X Q. When did he first say anything to you about the object of the experiment?

A. I cannot call to mind the first time he spoke of the object of this experiment.

105 X Q. State the first time you recollect of his speaking to you about it, and state what he said?

A. I cannot give any particular time when he spoke of the object of this experiment. At the time this experiment was made my time was not wholly devoted to experimenting on electric lighting, and the experiment only occupied my mind for a short time, as I had to make it for him. It was a frequent occurrence for me to break off experimenting on one thing to make an instrument to illustrate some idea of Mr. Edison's.

106 X Q. After you succeeded in getting the carbon in this lamp, to what degree of luminosity did you succeed in raising it?

A. I cannot tell the exact degree. I remember Mr. Edison and Adams made the experiment with it, and I remember that they all came to incandescence before oxidizing or bursting.

107 X Q. How long were they maintained in a state of incandescence before they were destroyed?

A. I cannot say, but they lasted a very short time.

108 X Q. Well, about how long?

A. None of them, I believe, lasted more than from ten to fifteen minutes.

109 X Q. Did you see these experiments yourself?

A. I was present and saw them, but did not direct the experiments, Mr. Edison doing that himself, as my mind was not on that. I was simply curious to see the result and did see it.

110 X Q. Then you can tell me whether the carbon was raised
to a red heat, to a yellowish heat, or to a white heat. Give
603 me, as near as you can, the degree of luminosity or color of
the carbon that was obtained in those experiments?

A. In those experiments the carbons were raised through the red and yellow to a white heat, and generally before bursting gave a very brilliant light. The degree of luminosity I cannot say.

111 X Q. How many carbons were put in this experimental lamp?

A. I cannot say the exact number, but am sure there were more than two. I could not swear to there being more than six or seven.

112 X Q. All that was put in, as I understand you, you put in?

A. Yes, sir; as far as I know.

113 X Q. How large were the carbons—give their several dimensions, as near as you can recollect?

A. I cannot give their dimensions exactly, but I remember the first one was the widest. Their lengths, as near as I remember, were about alike, and their thickness. I do not believe that any of these carbons were more than an inch long or less than $\frac{3}{4}$ of an inch. Their width was not more than $\frac{1}{4}$ of an inch nor less than $\frac{1}{32}$ of an inch, and their thickness, as near as I can judge, without anything to refresh my memory, would be in the neighborhood of from seven to ten-thousandths of an inch. As I did not carbonize these especially for the purpose, but cut them from already carbonized sheets, this measurement is as near as I can get.

114 X Q. What degree of vacuum did you obtain in the glass chamber or globe of this lamp in which you illuminated a carbon?

A. That I cannot tell; but I know that the vacuum pump, on the platen of which this was exhausted, will not, under any circumstances, give a state of exhaustion which I should call a good vacuum now. At that time I believe they pumped until they could see no diminution in the column of mercury, and then stopped.

115 X Q. When Mr. Edison saw the carbons illuminated
604 in this experimental lamp, and saw them go out, or destroyed
by the current, as you have stated, what did he say?

A. I cannot remember what he said, with the exception that he wanted another one in, and I proceeded immediately to put one in. My attention was taken with this, and I cannot remember what he said at the time, or whether he said anything further than expressing a wish to have another one put in.

116 X Q. After he saw the last one burn and go out, what did he say?

A. I cannot remember at this time that he said anything in particular.

117 X Q. Didn't make any remarks about the experiments at all?

A. I cannot remember that he made any at all at that time.

118 X Q. Why did he undertake the experiments?

A. Because his mind was running on experimenting with electric light as one of the after things of the telephone, for many months during our experimenting with that telephone, and before my time was devoted entirely to the light.

119 X Q. What did he undertake to prove by these particular experiments?

A. He did not undertake to prove anything to me about them. I knew from these experiments that he had me try what his object was to do, they needed no explanation.

120 X Q. How did you know what his object was?

A. I knew that he thought some on electric lighting. I saw him for a day or two working at a table near my table experimenting with a battery and pieces of material in between the electrodes, and I knew, without being told, that he was experimenting in electric lighting. Paper carbons were part of the same series of experiments, and he gave them to me because I was more used to doing work of that kind than he was, or, at least, I suppose so. My principal time, and almost all my energy at that time, was on telephones.

121 X Q. Then, as I understand you, you ascertained what Mr.
Edison's object was in making the experiments with this
605 exhibit, Edison's First Incandescent Lamp, by what you
saw him do, and not by what you heard him say?

A. Yes, sir; by what I saw him do, and what he had me do.

122 X Q. Now, what did you see him do, and what did he have you do, that showed you the object of his experiments?

A. As I said before, I saw him experimenting on electric lighting. He had me put paper carbons in the lamps marked Edison's First Incandescent Lamp, and I saw from that, that in this case, he wanted to make an incandescent electric lamp, in which the incandescent material was carbonized paper *in vacuo.*

123 X Q. And that, as I understand you, is all that you saw him do and all that you done, that led you to that conclusion?

A. Yes, sir; that is all that was needed to lead me to that conclusion. I afterwards saw him raise these carbons to incandescence in the vacuum, proving to me that such was the case.

124 X Q. When did you see him raise the carbons to incandescence in the vacuum afterwards; was it at the time of these experiments or afterward?

A. Immediately on my giving him the lamp with each paper carbon fixed in place.

125 X Q. Then, from the facts and circumstances which you have related, you inferred, as I understand you, that Mr. Edison's object was to make an incandescent lamp, in which the illuminating conductor should be of carbonized paper?

A. Yes, sir.

126 X Q. How well did Mr. Edison accomplish this object at that time?

A. The lamp was complete, and gave light for a short time. It was not a commercial success. As a lamp for a few minutes, it was a success.

127 X Q. If that was Mr. Edison's object in making those experiments, why did he tell you first to put hard carbon in the lamp, and then when he saw how much trouble it was to get in the
606 hard carbon, direct you to put in strips of paper carbon?

A. I do not know why he told me to put in the paper carbon, except that I know he did so.

128 X Q. Now, in putting this carbon in this lamp, I understand you to say that you screwed the glass globe off of the pedestal, in which the cock is placed below the globe?

A. Yes, sir.

129 X Q. That you screwed the ball off of the top of the stem?

A. Yes, sir.

130 X Q. And the gland off of the stuffing box?

A. Yes, sir.

131 X Q. And took the packing out of the stuffing box?

A. Yes.

132 X Q. And made the clamps on the end of the rod that forms the conductor in the chamber of the lamp?

A. Yes, sir.

133 X Q. That you took the piece of carbon and fastened it in the clamps?

A. Yes.

134 X Q. That you then screwed the lower end of the conductor

in the top of the pedestal in which the cock is placed under the globe of the lamp?

A. I either screwed it in there or fastened it in tightly.

135 X Q. You then passed the whole conductor up through the bottom of the globe, the upper end of the conductor passing up through the stuffing box, the globe being turned right upside down?

A. Yes.

136 X Q. You then, while the globe of the lamp was in an inverted position, screwed the pedestal in which the cock is placed in the bottom of the globe?

A. Yes.

137 X Q. Then put the packing in and screwed in the gland?

A. Yes, sir.

607 138 X Q. Now, after you had got the carbon in the lamp, and the lamp together in that way, how did you exhaust the air out of the globe?

A. This was done by an ordinary air pump. The base of this lamp, being true, was placed right over the exhausting hole of the platen, and the air drawn out of the lamp. This, I believe, was done by Adams.

139 X Q. How could the air be drawn out of the globe of the lamp unless there was an open passage between the air pump and the globe of the lamp?

A. You will find that there is such a passage in the inside of the lamp, I believe, where the screw is driven in.

140 X Q. On an examination of the lamp I do not find any such passage. Please to point it out.

A. You will find there are two small grooves, one on each side of the rod of brass, through which, if the grease was cleaned out of the lamp, you would be able to suck air.

141 X Q. When were these experiments with the Exhibit Edison's First Incandescent Lamp concluded?

A. They only lasted a few days altogether with this particular lamp, in the end of the summer or beginning of the fall of 1877.

142 X Q. Did you experiment with any other lamps at that time?

A. I do not recall to mind making any more lamps for Mr. Edison about that time.

143 X Q. I read to you your answer in examination-in-chief to question 26.

Counsel reads question and answer.

—. Were all the carbons that were then illuminated—I mean at the time referred to in your answer, which I have just read—illuminated in the bell receiver of the air pump, or did you then have at that time, in the fall of 1878, a lamp made having a glass chamber from which the air was exhausted, and into which you put these carbons to illuminate them?

608 A. As far as I remember, they were all illuminated in one of the bell jars belonging to the pump.

144 X Q. What was the shape of these carbons?

A. They were as near as we could get them to short, straight sticks.

145 X Q. Did you experiment with other carbons besides paper carbons at the same time?

A. Yes, sir; during the same series of experiments.

146 X Q. How long did that series of experiments last, and when was it concluded, as near as you can recollect?

A. I cannot say just what time I gave over experimenting myself on these; probably about the end of September, 1878.

147 X Q. After you concluded your experiments in the fall of 1878 with the carbonized paper in the bell jar of the air pump, when did you next use carbonized paper for illuminating in an electric lamp?

A. Shortly after the experiments referred to Mr. Edison used some of these carbons in the electric lamp, Exhibit No. 15.

148 X Q. Was that a sealed lamp in which the carbons burnt *in vacuo* or in an inert gas?

A. No, sir; the carbons burnt in the atmosphere.

149 X Q. When did you next use carbonized paper for illuminating in a sealed electric lamp, out of which the air had been exhausted, after you had completed your experiments in the fall of 1878—I mean the experiments in the bell jar of the air pump?

A. About the middle of October, 1879, within a day or so of the time that the first of the style of lamp of which Edison's Exhibit Commercial Incandescent Lamp is one, was made.

150 X Q. In that case, as I understand you, the carbon was substantially of the form of that shown in the Exhibit Edison's Commercial Incandescent Electric Lamp, and the lamp was made for the purpose of burning an incandescent conductor of carbonized paper or something substantially the same as carbonized paper?

A. It was substantially the same with this exception—that,
609 I remember, the first loop that was cut was cut straight and
bent round when put into the carbonizing chamber. The lamp was made for the purpose of a lamp. With the exception that I have mentioned, the lamp was similar to this exhibit.

151 X Q. When did you first cut the paper of the form substantially shown in the Exhibit Edison's Commercial Incandescent Lamp, before carbonizing?

A. I believe I cut them during October, 1879. My impression is, between the 20th and 25th. I think I could find the record somewhere amongst our books, to that effect.

152 X Q. Then, as I understand you, the first sealed incandescent electric lamp or lamps that Mr. Edison made, or caused to be made, as a lamp, in which he used carbonized paper for the illuminating conductor, was made in October, 1879?

A. With the exception of the Exhibit Edison's First Incandescent Lamp, and the experiments I have mentioned in the bell jar of an air pump, the lamp made in October, 1879, was the first lamp which answers the conditions of your question.

153 X Q. Referring now to Exhibit No. 16, please to describe ex-

actly how you carbonized that paper, and what kind of blotting paper you used.

A. The Exhibit 16 is ordinary blotting paper similar to that which I now put in the box with Exhibit 16 and mark in ink with my initials. These sheets were carbonized in the same box that I have spoken of as being one in which Exhibits 21 and 22 were made. The paper was put in the box, tightly packed with powdered charcoal between each sheet. They were made to show what kind of carbon ordinary blotting paper makes when carbonized substantially the same as is spoken of in Mr. Man's testimony.

154 X Q. How did you fasten the lid down on the box in this case, the same as in the other case?

A. I did not fasten the lid down by wire, as spoken of in one of Mr. Man's statements, as the lid of my box has a projection going inside the box.

610 155 X Q. Was there any pressure upon the paper during the operation of the carbonization?

A. None except the weight of the lid.

156 X Q. Was the full weight of the lid upon the paper?

A. No, sir; the lid rested on the tightly packed powdered carbon. The papers were some distance from the surface.

157 X Q. Did you saturate the paper with any carbonaceous material, put it in a dydraulic press and press it hard, before carbonizing?

A. I did not saturate this exhibit with anything, nor did I press it. I, however, pressed a piece of the blotting paper under a powerful screw-press and carbonized that. I did not, however, saturate this with anything. I have produced this and it is here, marked Edison's Exhibit No. 17. I made these to show the kind of carbon that blotting paper made, whether pressed or in its ordinary state.

158 X Q. What experience, if any, have you had in treating paper carbons electrically, in the presence of hydrocarbon gas?

Question objected to as being new matter, not brought out upon examination-in-chief.

A. I have had considerable experience in treating carbonized paper used as an incandescent conductor in hydrocarbon vapor in connection with the paper carbon loops of Edison's electric lamp.

159 X Q. What effect does such treatment have upon the paper-carbon burner?

A. It deposits carbon from the hydrocarbon on the surface of the incandescent conductor.

160 X Q. Doesn't it fill up the interstices and consolidate the carbon—making it finer and more compact?

A. It probably does fill up the little interstices on the surface, but I do not think it makes the paper carbon any more compact. It adds to that by coating on the surface. I have frequently
611 broken these conductors that have been treated in the vapor of the hydrocarbon, and, under a powerful microscope, have found that the fracture of the paper carbon showed no greater den-

sity, and the deposited carbon sticking to it in the shape of small needles stuck endwise on it.

161 X Q. In the presence of what kind of hydrocarbon gas did you treat the carbon; how high did you raise its temperature of luminosity?

A. In our experiments we have generally used the vapor gasoline, benzine and such vapors. The carbons were raised to different temperatures, but were always raised to brilliant incandescence when we were depositing this carbon.

162 X Q. Under what pressure of the gas did you treat the carbon?

A. I do not know what pressure we had. The chambers that I had made for the experiments in the experiments I speak of always had a small outlet, so that the vapor could escape, and we made it while the experiment was going on. We did not create an artificial pressure for the purpose of treating carbon under pressure. If there was any pressure at all it was an incidental pressure, while we were making the gas.

163 X Q. How large were the carbons you treated?

A. Some of the carbons were the same as the one in Exhibit Edison's Commercial Incandescent Electric Lamp. The other carbons were about the same size, but made from different fibres.

Redirect examination by GEORGE W. DYER, counsel for Edison:

164 Q. Do you wish to explain your testimony in regard to first putting carbons into the lamp, Exhibit Edison's First Incandescent Lamp—if so, please make your explanation?

A. Yes; in my direct testimony I testified that Edison wanted a hard carbon put in that lamp, so that it reads as if he requested that it should be specially hard carbon. I could not swear 612 that he especially wanted a hard carbon, but that he told me, as I have afterwards stated, to put a carbon in the lamp, and I proceeded at that time to put a hard carbon in, supposing that was what he wanted.

165 Q. Referring to your answer in cross-examination about the Exhibit First Incandescent Lamp, state, if you remember, how long before the experiments with the lamp was the lamp made, as a lamp?

Question objected to, and all testimony appertaining to the alleged lamp—Edison's first incandescent lamp—as tending to prove that the invention was made before the date alleged in the preliminary statement; because the question assumes that the so-called lamp was ever made for a lamp.

A. The lamp was used as a lamp within a day of its being made as a lamp.

166 Q. At the time of these experiments with this exhibit, do you wish to be understood that the only conversation Mr. Edison had with you in regard to electric lighting by incandescence was the direction to put a carbon in that lamp?

A. Previous to that time and after that time, Mr. Edison had frequently spoken of electric lighting for domestic purposes as a big field for experiment when we had the telephone and some other things off our hands. He frequently tried experiments himself whilst we were working on these other things. He knew that I was conversant with the experiments and the end they tended towards, and therefore his order to me, to put the carbon in, that needed no further explanation from him as to what he proposed to do.

613 The witness, CHARLES BATCHELOR, being further interrogated, as a portion of his direct examination, by WALTER K. GRIFFIN, Esq., counsel for defendant, testifies as follows:

167 Q. What is your name, age, residence and occupation?

A. Charles Batchelor; 43 years of age; I reside in New York city; I am assistant to Thomas A. Edison; as such my duties have been for the last nineteen years the carrying out in a practical manner the ideas of Mr. Edison generally in his laboratory with a large force of men, at other times building and designing especial machinery for the various businesses that his discoveries and inventions have created. At present I am commencing the manufacture of his phonographs part of my time, the rest of my time superintending a large number of his experiments in the laboratory.

168 Q. I hand you a book and ask you to state what the same is?

Book handed witness.

A. The book referred to is vol. 52 of a series of books in which records of experiments were kept at the time we were in the Menlo Park laboratory, and refers principally to experiments that I carried on for Mr. Edison in the latter part of 1879. It is especially a book that was always kept on my personal work-table. Whilst I had general charge of the place I still did a very large amount of personal experimenting. I wrote in almost all the books that were around the shop, but this one in particular is almost entirely in my own handwriting.

169 Q. Did you have the book in your possession or know of its whereabouts at the time of your deposition in the interference?

A. I believe not. The book was mislaid at the time of this interference suit and I was rather surprised to see it brought here again. The reason we always gave for the losing of some of our

614 books was the fact that they contained records of our experiments very largely on telephones, and many of such books were put or used in interference cases. I do not think that there are many telephone experiments in that book, but we could not find it at the time.

170 Q. With the aid of the book please state your recollection of the experiments in electric lighting made by Mr. Edison or by yourself under his direction so far as the same are referred to in the book, having special reference to such experiments as involved the use of carbons for the purposes of illumination?

A. The first part of the book relates particularly to that part of

a line of experiments where Mr. Edison required a very high resistance conductor to be used in an incandescent lamp and in which the incandescent part should occupy a small space. It was particularly necessary for these experiments that the incandescent conductor should have a high resistance, and those experiments relate to metal conductors. The rest or two-thirds of the book about consists in experiments for incandescent conductors to be used in lamps made from carbons carbonized from very many different substances and formed into many different shapes. They refer to lamps made from carbons carbonized from tarry matters, threads of different kinds, papers of many kinds and many other materials. My recollection of these is that there were many of them that were very excellent lamps, and I find some of them of which there were large numbers used at the same time. Those lamps which involved the use of carbon were generally very good lamps; my part of the work there was generally to make the incandescent conductor, place it in its position and give directions to the glass-blower to put it in its place, after which it was generally put on the pump by one of our assistants, after which I got a statement of its value as a lamp. The latter part of the book consists mainly of lamps with incandescent conductors of carbonized paper and of these lamps there were a great many made, as many as seven or eight hundred of them being used in Menlo Park at one time. In regard to the carbon experiments I find
615 that we made incandescent conductors October 7th, 1879—
carbon spirals. These were made from paper tarred, rubbed with tar and lamp-black and rolled into the shape of a thread. They were then wound in a spiral form on a special device for that purpose, carbonized, and afterwards put into lamps. These were also made of powdered electric-light carbon, which was made into a pasty mass, then rolled up in the form of a thread, carbonized and placed in lamps. On page 92 I find an incandescent conductor made from paper cut in the form of a flat ring, carbonized, and a small piece of the carbon cut out so as to leave two ends to the imperfect ring. These ends were fastened to the leading wires of the lamp so as to put it into the lamp. I next find experiments showing the best way to work and carbonize these lamps. Next I find that we made carbons for incandescent conductors of cotton thread which we bent into shape and carbonized, after which we attached the ends to similar conductors to be placed in lamps. At the same time we made lamps having carbonized conductors from vulcanized fibre, threads rubbed with tarred lamp-black, soft paper, fish line, fine threads plaited together in strands, soft paper saturated with tar, tar and lamp-black mixed with a proportion of lime, different kinds of thread, card-boards, cotton soaked in boiling tar. Immediately following this there is a record of some of the lamps above mentioned. Shortly after this I carbonized a great many materials, such as vulcanized fibre, celluloid, box-wood, cocoanut hair and shell, drawing papers of different grades, spruce shavings, hickory shavings, bay-wood shavings and cedar shavings, rosewood fish lines, maple shavings, tissue paper, string cotton, lampwick, punk,

cork and bagging flax. Immediately following is the record of
lamps made from some of the before-mentioned pieces, with
remarks in many cases of how they lasted or how they were
carbonized and how or why they ceased to burn. Then fol-
low some of the different methods of how they were fastened
to the platinum wires, in order to secure their good con-
nection at the point of contact. Then follow experiments
616 in methods of carbonizing card-board for conductors. On page
145 I find a sketch which is about the actual size of carbon
conductors, of which there were a large number made, which shows
the size of the paper cut from card-board and its size after carbonization. I find also designs for tools for cutting such paper carbons. Then follow a series of numbers of lamps that were made from this model, with occasional remarks of their being made from different materials. Lamps made from these are shown in design attached to the fixtures which were designed at that time for receiving them. Pages 171 to 179 inclusive contain records of lamp carbons made from different kinds of paper, most of which had impurities in the paper. These are immediately followed by designs of tools that were made to cut such papers. Pages 185 to 211 contain records of lamps made from carbonized card-boards with records of some of the facts connected with them, and in some cases deductions drawn from the experiments. Pages 219 to 223 are a record of about fifty lamps showing their condition before putting in the lamp as regards their resistance and the same condition after they were put in the lamp. Pages 225 and 227 relate to methods of carbonization of the paper for lamps with remarks that were made at the time. Page 229 relates to lamps made about this time of carbons made from paper cut in circular form. Pages 233 to 237 relate to methods of carbonization and some deductions therefrom. The rest of the book contains methods of carbonization and records of some of the lamps that had been made from paper carbons. The results of the experiments in this book are to the effect that Mr. Edison produced lamps having the requisite conditions that he had been long looking and working for, viz: a high-resistance incandescent conductor entirely enclosed in a single piece of glass from which the air had been exhausted to a very high degree. It does not by any means give a list of all the experiments, but only a very few.

617 The book above referred to is offered in evidence to be marked "Defendant's Exhibit Batchelor Note Book No. 52, March 7, 1889."

171 Q. You stated something in your last answer as to obtaining a high vacuum in the lamps. By what means did Mr. Edison progress towards obtaining this vacuum?

A. At the time that these experiments were made we had already got what we conceived as a high vacuum. Some of the previous experiments had been made in a vacuum, such as could be got from a common air pump. These had extended back for a considerable time, and all incandescent burners which we had raised to give light in such a vacuum had never been satisfactory to Mr. Edison, as the materials of which the burner was made were liable to oxidation in a more or less degree as the vacuum was good or bad. At the time of these experiments Mr. Edison had made lamps which were entirely made of one piece of glass, and by a long series of experiments he had been able to make mercury pumps which would exhaust the air very thoroughly; in fact, equal to anything that is similarly found in the pumps that are used now for manufacturing lamps.

172 Q. How does carbon compare with metals such as platinum or iridium so far as this liability to oxidation is concerned?

A. Carbon compares very poorly in this regard with the finer metals where the carbon is in the open air or even in a poor vacuum. This was our experience in former experiments where we had but a poor vacuum. A lamp made from platinum, some of which are shown in the first part of that book, would last much longer than a lamp made under the same conditions from carbon. In my testimony given in the interference case in 1881 between Sawyer & Man and Edison, already in this case, I testified to having put incandescent conductors in a lamp in October or September, 1877. From these experiments I remember that Mr. Edison about that time had frequently put a current through platinum and platinum-iridium, lighting them to incandescence. He had experimented with 618 small pieces of carbon in the same manner, but they had lasted such a short time that he asked me to put him a piece of carbon in the lamp and exhaust the air from the lamp so that he could raise it to incandescence in a vacuum. This I did, but owing to the vacuum being imperfect they did not last long at the brilliant incandescence that he wished to run them. In the open air this same carbon would not have lasted at all.

173 Q. So long as the vacuum is poor is there any substantial difference in the life of the carbons due to a different nature of the carbon: that is to say, would a filament of gas carbon or of paper carbon or of bamboo carbon have any material difference of life in a poor vacuum?

A. I think a poor vacuum would be fatal to all as a long-life lamp.

174 Q. How long did Mr. Edison continue in the commercial sale or manufacture of paper-carbon lamps, to the best of your present recollection?

A. I think, to the best of my present recollection, the paper carbons were discontinued in the early part of 1880.

175 Q. After that time what proportion of the lamps manufactured were made of paper?

A. I cannot say at present, but I know a very small proportion.

176 Q. At the time of the decision in interference, January 20, 1882, by the examiner of interferences, J. B. Church, were any paper lamps being manufactured and sold by Mr. Edison or the Edison Company, commercially?

A. There may have been a few paper lamps made for experiment, but the lamps sold to the public were entirely made from other material, bamboo fibre. I may say here that at all times, then and since then, Mr. Edison has been continually making lamps of different materials, but the standard manufacture of lamps at that time, as now, has been and is bamboo fibre.

619 177 Q. What were the practical reasons, if any, which resulted in the commercial abandonment of paper carbon?

A. Mr. Edison found that he could get better carbons for his purpose from a particular part of the bamboo plant than he could get from paper.

178 Q. What was the trouble, if any, with the paper carbon in its commercial use in lamps?

A. The trouble with the paper carbon, from a commercial point of view, was its average life. This in some of the paper carbons was great; in others it was quite small, owing to defects in the paper, causing small arcs at those points and shortening their life. Their average length of life would not compare at all, however careful we were to cut and carbonize them, with the average life of bamboo fibre when properly selected.

179 Q. What was the nature of the trouble caused by the formation of internal arcs in the paper carbons?

A. In the lamps made from carbonized paper, wherever there was a slight defect in the paper, at this point the continuity of the lamp carbon would be lessened as far as the carbon is concerned, owing to the imperfection in the paper being due to some other substance. This would increase the resistance of the carbon at that point to such an extent that it would amount almost to an arc, and we generally saw it whilst the lamp was burning, especially if we only lighted it to a dark red, in the form of a brighter spot at that point than on any other part of the filament. Paper carbons are also defective for lamps by reason of their blackening the globes, owing to the carbon being deposited from the filament on the glass. In Exhibit Batchelor, Book 52, my records frequently state that the lamps broke at a certain place or were "busted" on the pumps. These we frequently examined under the microscope, and many of them we thought were due to imperfections in the paper. In cutting the paper we always took great care to select those portions of the paper that did not show any defect to the naked eye; but it
was very frequently the case that the defect might be inside
620 the paper, causing the point of high resistance and destruction of the lamp all the same.

180 Q. Do you know of any lamps on the market having carbons of paper?

A. No, sir.

181 Q. So far as your knowledge extends, is the use of paper as a carbon for an incandescent electric lamp of any recognized value at the present day?

A. The use of paper carbon in a lamp for an incandescent conductor is so much poorer than bamboo that I believe that there are no manufacturers or sellers of it in the world to-day.

182 Q. Was there anything in the use of paper carbon as such that suggested to Mr. Edison or yourself the use of bamboo fibre or the particular quality of bamboo fibre that you finally adopted?

A. There was nothing in paper carbon that was essentially better than anything else carbonized to make a carbon from, except that it was an easy and cheap method of being able to manufacture. It was by no means such a carbon as we have now, which by nature is almost perfectly solid, much smaller and perfectly uniform, which the imperfections of paper never would allow us to get.

183 Q. What experiments has Mr. Edison made from time to time as to the suitable material for use in incandescent lamps?

A. Mr. Edison's experiments have been very extensive. I have made lamps for him from almost every conceivable fibre, from almost all the woods, for some of which I have designed expensive machinery before making them. Mr. Edison's experiments on the grasses and bamboos have been very extensive. He has sent a number of men to different parts of the world, at great expense, who would continually send him large batches of different fibres and different woods which we would select from and make lamps. He has spent a great deal of money in this direction. As I remember now, he has at the present time one man who has been down
in the Cauca valley, in the United States of Colombia, for
621 about a year. He has sent out at two different times men
to Buenos Ayres. He has had a man in Mexico; he has sent two different men to Florida and Cuba; he has sent a man to India and Burmah; he has sent a man for 2,000 miles up the Amazon at one time, and at another time sent two men together for about 2,500 miles up the Amazon, one of them returning and the other one crossing over to the other side of the continent, and he is the man who is now in the Cauca valley. And this has been done at an enormous expense, as his books will show. These men have all sent back large lots of samples of various woods which have been put through tests sufficient to find their availability for incandescent lamps. I should mention also a man that he sent to Japan, China, and the Malay island.

184 Q. Have you experimented with exogenous woods, and, if so, what have you found to be their value in actual use in an incandescent lamp such as you manufacture or have manufactured since the beginning of your business?

A. The use of such woods is very poor for an incandescent lamp. To get a perfect carbon from such woods is almost impossible, owing to the fact that there are cross-fibres running around the wood which you are obliged to cut in cutting lengthwise with the grain. Wherever such a fibre is cut it leaves a bad place in the carbon, owing to the fact that that fibre is partially hollow and lessens the cross-section of your fibre at that point; and in such woods you have a fault similar to what I mentioned in the paper carbon which would cause arcs, but very much more so than in the paper carbon. I consider them practically useless.

185 Q. Do you know of any manufacturer who sells lamps having the carbons made of any of the exogenous woods?

A. No, sir; I believe they are not employed by any manufacturer.

186 Q. To your knowledge, have they been employed by any manufacturer?

A. No, sir.

622 187 Q. How many exogenous woods has Mr. Edison, to your knowledge, experimented upon?

A. I could not say exactly, but a great many; I should judge forty or fifty. I made at one time a special machine for him to cut these woods out, and I know we tried a great many of them before giving the thing up, as it was rather an expensive experiment.

188 Q. Were these experiments with exogenous woods on one or two lamps, or on how many?

A. I should judge as many as forty or fifty of them, using different kinds of wood.

189 Q Exclusive of bamboo, are you aware of any wood of any description now being used commercially in the manufacture of incandescent lamps?

A. No, sir.

190 Q. Out of the stem of a bamboo, how much have you found practically and commercially available for the manufacture of carbon filaments?

A. There is a very small portion of the bamboo that is practically available for the purpose of making a commercial incandescent lamp. This is the most solid part of the wood, right next to the silicious cuticle, and although the thickness of the shell in some cases is as much as an inch, we can only use a few thousandths of it next to the scale. I would also say that of all the many kinds of bamboo that there are in existence there are only a very few that we can make such carbons from, and these could be very soon spoiled for our purpose previous to their getting to us if they were not of a certain growth and seasoned in a proper manner.

191 Q. Have you found by experiment that bamboo has to be cut in any special manner in order to form suitable filaments?

A. We had to design, for making the fibres from bamboo filaments, special machinery to cut that part out of the bamboo that was good for our use; afterwards to take the scale off of it, and then to cut the fibre lengthwise in such a manner as never to split or cut through a single fibre on the outside. The necessity of this was discovered by Mr. Edison when we found that the finest 623 bamboo that we can get is only made up of a number of single fibres very close together, and if we should cut one of them across it would materially lessen the availability of that particular piece of bamboo for use in an incandescent lamp. This we tried to avoid, as after it has been carbonized it has cost considerable money, and all that money would be thrown away if we should find out afterwards, when it was in the lamp, that it had been spoiled in cutting. These things, and many other peculiarities of manufacture necessary to a successful carbon, even from bamboo, we had to find out by a long series of experiments.

192 Q. What do you mean by your answer in regard to the necessity of proper seasoning of the bamboo?

A. In the early part of these experiments we had, along with samples of bamboo, also samples of the same bamboo that were of different growths as regards age and also the different lengths of time that they had been seasoned, and it was found that the filaments which came from the same bamboo were not as good when of some age or of some particular method or time of seasoning as others, and experiment told us which were the best. After knowing this we gave our orders for our fine strips of a certain age and a certain seasoning, and that is done, I believe, to the present day.

193 Q. How many endogenous woods and grasses has Mr. Edison experimented upon, to your best recollection?

A. Several thousand.

194 Q. Out of these several thousand how many were practically available, so far as their electrical qualities were concerned, for a filament for an incandescent lamp?

A. There are very few indeed that I could call available for an incandescent lamp. Some of them, although pretty fair, are too difficult to manufacture. Others, while pretty fair for pretty short lengths, cannot be got out for long lengths. I should say that the bamboo, and one or two others, are about all that can be used, that we know of, commercially. Some of the fibres are so loose 624 and have so little carbonizable matter between them that when carbonized they will split apart. Others are so coarse-grained, or the cell wall so small in proportion to the size of the fibre, that it is practically impossible to make lamps from them. We had to find out all these things by experiment. The wood would look all right to the eye to cut filaments from, but something would be there, so that, when carbonized, we got an entirely different result from what we expected, the cause of this being, in many cases, undiscoverable, but arising, probably, from some peculiar chemical constituent in the wood.

195 Q. Was any substance known or described generally in the art, on January 9, 1880, as "carbonized paper cover with powdered plumbago"?

A. No, sir; I know of none; I never heard of it.

196 Q. Is it practically possible, in any ordinary sense, to cut out a filament of carbon, such as used in the Edison lamps, from carbonized paper?

A. It is practically impossible. The carbon cut from carbonized paper from such extreme thinness as would be required for a filament similar to the Edison incandescent lamp filament to-day, or at any time, would be an exceedingly difficult mechanical operation. Its liability to fracture during the operation of cutting would be so great that I doubt very much whether I myself, who am very expert at anything of that kind, would be able to cut more than one in a hundred, and I should not consider it could possibly be anything like as regular and uniform mechanically, not to say electrically, as our present fibre.

197 Q. Are you, and were you, on January 9, 1880, acquainted with the general state of the art in relation to electric lighting, and, in particular, to incandescent electric lighting?

A. Yes, sir.

198 Q. In view of the general state of the art at that date (January 9, 1880), would a direction to use wood carbon or charcoal as an incandescent arc or burner in a lamp be of any value as a guide or index to the selection of a suitable arc or burner, or have
625 any value as an aid to the manufacture of a suitable arc or conductor?

A. No, sir; not at all.

199 Q. Is there any quality known to you in wood carbon, as such, which in any way adapts it, as compared with other carbons, for use in an incandescent lamp?

A. No, sir. Out of all the woods that we have tried, we had to find out a peculiar property that is only applicable to a very few of the very many woods that we tried. If wood carbon had been suggested to us it would have given us no clue at all, in the state of the art at that time, to the existence of these qualities that Mr. Edison had to find out with so much experimenting.

200 Q. Similarly I ask you whether, in view of the general state of the art at that date (January 9, 1880) a direction to use an arc or burner for an incandescent lamp, of wood charcoal, would have been of any value or assistance as a guide or aid in the manufacture or selection of a proper arc or burner for an incandescent lamp?

A. Such a suggestion would have been no use at all, as the natural meaning of such a suggestion at that time would have been the use of an exogenous wood, such as willow charcoal, or charcoal made of boxwood or other such woods. Mr. Edison and myself, by reason of our private experiments, had probably gone much further than the general state of the art at that date, and even with our knowledge from our experiments such a direction would have been of no value, for, as already testified to by me, we have never succeeded in making an incandescent lamp, having an exogenous wood as the arc or burner, which could by any stretch of language be called a commercial lamp.

201 Q. In view of the general state of the art at the same date, would a direction to make an incandescing arc of carbonized fibrous material have been of any value as an aid or guide to the manufacture or construction of a proper incandescing arc or burner for for an electric lamp at that date?

626 A. No, sir; for the reason, as I said before, that it was only by tedious experiment we found those particular qualities in certain materials that proved to be of value. The term "fibrous" would apply not only to vegetable matter, but to animal matter, and, if used in the broadest sense, would cover almost the entire kingdom of organic substance, and out of this enormous mass of material it would be impossible to select a suitable incandescing arc or burner, except by such experiments as Mr. Edison actually conducted, in which the peculiar qualities adapting a substance to incandescing lighting might be determined. The fibrous quality of many materials is the very quality which actually destroys their value for incandescent lighting, owing to their sinuosity and the fact that the fibrous nature differentiates one portion of the material from the other, causing a difference of electrical resistance between

one portion of the material and the other, and so a tendency to disruption. This is the case with nearly all grasses and with nearly every wood or woody material that we have experimented upon. I do not mean to say that all these materials would be absolutely useless—that is to say that they could not be rendered incandescent—but that in any ordinary sense, considering the fact that they are to be used in a lamp for practical use to give light, they are of no commercial value.

202 Q. How did you ascertain the fact that in certain woods the fibres were so arranged or of such a character or nature as to be injurious electrically to the life of an incandescent burner?

A. By the use of the microscope, either before the lamp was made or after the lamp had proved bad. We were led to the use of the microscope after our experiments had continued some time.

203 Q. In view of the general state of the art at the same date (January 9, 1880), what value, if any, would there have been to you in the mention, in a specification, that the inventors had tried carbonized paper covered with powdered plumbago for use as an incandescent arc or burner for an electric lamp?

A. Absolutely none. I do not see for what reason they
627 should cover the carbonized paper with plumbago. If they
already had carbon it could do it no good to cover it with plumbago. If they wanted a greater surface, or a greater amount of carbon, they could have taken a little thicker paper and got the same result. As I have already testified, paper already carbonized I had put in a lamp for Mr. Edison previous to this time, and it would have been of no service to me, in the making of a better lamp, to have told me to put plumbago onto it.

NEW YORK, *March 8th*, 1889.

Met pursuant to adjournment.

Present: Amos Broadnax, Esq., for complainant; Walter K. Griffin, Esq., for defendant.

CHARLES BATCHELOR, being further examined by MR. GRIFFIN, testified as follows:

204 Q. Please examine the patent in suit, with the specification and drawings, and state whether to your knowledge lamps of the construction shown in said patent, are now, or at any time to your knowledge have been used practically and commercially, or offered for sale in the market?

Objected to as incompetent and immaterial.

A. I know of no lamp, such as is shown in this patent, having been offered for sale in the market; I have no knowledge of any such lamps having been used commercially in incandescent lighting.

Answer objected to as irresponsive.

205 Q. Have you any knowledge of the use of such lamps practically for other electric lighting than incandescent?

Objected to as incompetent and immaterial.

A. I have not.

628 206 Q. Examining the said specification and drawings and further examining the specification and drawings of letters patent No. 205,144, to Sawyer and Man, referred to in the patent in issue, please state whether you find there shown a lamp chamber wholly of glass?

Objected to as incompetent and immaterial.

A. I do not.

207 Q. Why do you consider that the lamp chamber shown in the patent in suit (No. 205,144, to which I referred you), is not wholly of glass?

Objected to as incompetent and immaterial.

A. Because the lamp chamber A is placed on the glass disc B having a slight coating of fir balsam, or some cement between them; also at another place, L, on the glass plate B, the patent says that he uses some cement and tinfoil between the glass stopper and the plate B. If the chamber was entirely of glass there would be no other materials forming any part of the walls of that chamber.

208 Q. Fir balsam is Canada balsam, is it not?

Objected to as incompetent and immaterial.

A. That is what is generally supposed.

209 Q. Assuming the lamp shown in the patent in suit, letters patent 205,144, to be lit, and in actual operation, what would be the effect of the heating of the lamp upon the fir balsam or other cement used to connect the base with the globe of the lamp?

Objected to as incompetent and immaterial.

A. It would tend to soften the same.

210 Q. How is Canada fir or Canada balsam affected by heat?

Objected to as incompetent and immaterial.

629 A. Canada fir or Canada balsam is made more fluid by heating.

211 Q. Assuming the lamp shown in or referred to in the patent in suit to be filled with a gas, as for example, nitrogen, what would be the effect of rendering the lamp incandescent, upon the cement joint between the base and the globe of the lamp?

Objected to as incompetent and immaterial.

A. The heat produced by the incandescence of the lamp would in my opinion expand the gas, thus putting a greater pressure on the inside of the gas than on the outside. This heat continued would soften the Canada balsam, and there would be a tendency of the rarified gas to get out at the most imperfect part of the joint. The reverse would be the case after the lamp was extinguished, except that in that case the atmosphere would tend to get in.

212 Q. In your opinion, would the expansion and contraction of the glass base and the bell of the lamp be uniform or vary, and what effect, if any, would such contractions and expansions have upon the cement used to connect the base and the bell, and upon the clamps fastening the base?

Objected to as incompetent and immaterial.

A. I do not think that the difference of expansion in the glasses would make very much difference in the lamp; but the continual heating and cooling of the interior of the lamp would tend to make a bad joint at their point of contact.

213 Q. Have you had any practical experience and knowledge of the art of fusing glass for the purposes of incandescent lamps?

Objected to as incompetent and immaterial.

A. Yes, sir. I have superintended the making of most of the
processes that are used in the Edison lamp factory for this
630 purpose. I have also built and ran for some three years a
large lamp factory in France, and my knowledge on this
subject, although not an expert glass-blower, is considerable.

214 Q. In your opinion is it practically possible to fuse together a glass disc or plate, and the flanges of a glass globe, such as is shown in figure 5 of the patent in suit?

Objected to as incompetent and immaterial.

A. It is practically impossible to fuse the two pieces of glass shown in No. 317,676, without damage to the globe.

215 Q. What is the reason of this?

Objected to as incompetent and immaterial.

A. The reason of this is that the thin glass fusing, the globe will cool off so much quicker than the large portion, that when the whole is cold some parts of the glass will be under tension. In nine cases out of ten it would crack almost immediately after it was cooled; and if not then, a very short time afterwards.

216 Q. Referring you again to figure 5 of the patent in suit, and to letters patent 205,144, mentioned in said patent, and to the explanation in the specifications of these two patents of how the metal tubes are closed by metal caps, state whether or not in your opinion it is practical to close such a lamp chamber so as to maintain such a vacuum as is suitable for a practical incandescent lamp?

Objected to as incompetent and immaterial.

A. I do not think that the method shown in either of these patents are suitable for closing a lamp chamber for a practical commercial incandescent lamp. I do not see that in either case they
could get anything more than a vacuum similar to what could be
got in an ordinary common air pump. They certainly could
631 not exhaust it to such an extent as in any commercial in-
candescent lamp that is at present on the market.

217 Q. In your opinion, and from your experience, would it be

possible to maintain any efficient vacuum in a lamp such as is shown in the patent in issue, if the glass disc were ground so as to fit smoothly against the flanges of the glass bell, and clamped however tightly, without any connecting cement?

Objected to as incompetent and immaterial.

A. In my opinion it would be impossible to keep such a vacuum under the conditions under which an incandescent lamp has to work.

219 Q. Referring you again to the lamp shown and described in the patent in suit, would there be any advantage in the use of a fibrous or textile carbon, or a carbon made from fibrous or textile material, as compared with the use of hard carbons?

Objected to as incompetent and immaterial.

A. I do not see any advantage to be gained, except that it might be easier mechanically to work it.

220 Q. Is there, or was there, in view of the state of the art on January 9th, 1880, any difficulty in making artificial carbon pencils, such for example, as the Carré pencils, of the dimensions similar to or identical with the dimensions of the carbon burner shown in the patent in suit?

Objected to as incompetent and immaterial.

A. I believe there was no difficulty in making such; but the particular carbons here do not seem to me to be round.

221 Q. Is, or was there any material difficulty in manufacturing artificial carbons of such material as the Carré pencils are composed of, of the size and shape shown in the patent in suit? 632

Objected to as incompetent and immaterial.

A. The Carré carbons are generally made round, but the plastic material when in such a state could very easily be squirted through a die having a rectangular section, and previous to their being baked, small portions of these could be taken and bent into the form of an arch, and placed into a lamp similar to that in the patent in issue.

222 Q. Can you tell from the drawings of the patent in suit the nature of the electrical system (exclusive of the lamp) in which the lamp shown is intended to be used?

Objected to as incompetent and immaterial.

A. If the patent- had ever intended to work more than one of these lamps from a machine commercially, he certainly must have intended to work them in series. He certainly could not expect to distribute light over a section of a city with such a lamp as that in multiple arc, which is the generally recognized method of doing so.

243 Q. Where lamps in series are used, is it an advantage or disadvantage to have the resistance of the incandescing conductor high?

Objected to as incompetent and immaterial.

A. It should be as low as possible.

224 Q. How does the resistance of incandescent conductors, say of paper carbon, compare with similar conductors of gas-retort carbon?

Objected to as incompetent and immaterial.

633 A. To the best of my knowledge carbons made from paper carbonized would have considerable more resistance than would what we call hard carbon, when both have the same cross-section and length, even when the carbonization is the most perfect.

225 Q. Returning to the subject of the carbonization of materials for incandescent conductors, state what precautions or conditions you found necessary in practice in order to manufacture paper carbons of suitable character for incandescent conductors?

Objected to as incompetent and immaterial.

A. There are ma-y conditions to be attended to in order to produce paper carbon for an incandescent conductor of a lamp that will be good commercially. I believe in our exhibit yesterday (Book No. 52, which was put in evidence) many of these conditions are enumerated; but briefly I will give my recollection of some of them. It is very necessary that the carbon should be straight after carbonization. It is also necessary that its shrinkage should be uniform all through. It is necessary that its uniformity should be so great that their electrical resistances are about alike. It is very necessary that you should take a certain amount of time in making such carbonization, as, if it is done too quickly, all those hydrocarbons which become gaseous below about 700 or 800, will be driven off, and tends to rupture whatever is left in getting out; wheteas they ought to be left in to produce better carbon by their own interlocking of the remaining particles. A carbon made by carbonizing paper in a furnace that is already very hot, and in which the carbon is brought in a few minutes to a white heat, would be practically useless, and its resistance would be very much greater than if it was brought up to a certain heat very slow, and only to a white heat after it had been hot for some time.

226 Q. Were all forms of paper suitable for the manufacture of incandescent conductors?

Objected to as incompetent and immaterial.

634 A. No, sir; there are very many forms of paper that are quite unsuitable. Most forms of card-boards are heavily loaded with oxides of one metal or other—I presume to give them a better finish or to weigh heavier; and these are very unsuitable.

227 Q. Is blotting paper suitable for use as an incandescent conductor when carbonized?

Objected to as incompetent and immaterial.

A. I should not consider it at all suitable.

228 Q. In the carbonizing of paper carbon, what was the effect, if there was any, of unequally heating the different parts of the filament during carbonization?

Objected to as incompetent and immaterial.

A. The effect would be that some parts of the carbon filament would have more resistance than others. This would be detrimental to the lamp, as it would give "spots" in the filament that would be brighter than others, and consequently shorten its life.

229 Q. In the carbonizing of paper, did you find it necessary to use any means to preserve the tension or strain of the fibres composing the paper?

Objected to as incompetent and immaterial.

A. Yes. As I have already stated, it was necessary to bring them out straight and uniform. In order to do this, we had determined, by experiment, that it was necessary to put a weight on each carbon, or a given weight for a total number of carbons, whilst they were in the mould, and heating up in the furnace. Our method of carbonization to accomplish this result generally was to place some sheets of thin paper that we did not want to use as carbon, on top of which we placed paper intended for a filament; after which, a few more sheets of paper, and then another filament; and so on for quite a number of carbons intended for filaments. At other
635 times, we had a single weight for a single filament. These were our practical and cheapest methods of getting the desired result.

230 Q. Do you find any statement in the patent in suit, or in the original specification filed January 9, 1880, which, as the art stood at the date of said original application, was, or would have been a sufficient description to enable a proper paper to be selected for an incandescent electrical conductor without experiment?

Objected to as incompetent and immaterial.

A. I do not. I find no description of preparing paper carbons, except that where it is said that they are confined in retorts, in powdered carbon. In fact, the patent, and the specification in question, leave it entirely to the skill of the man who is going to make the lamps, to find out which is the best method. Certainly, long before the application of January 9, 1880, we had discarded in our own experiments, and for carbonizing for commercial lamps, the only method that I see here described.

231 Q. My previous question was intended to refer not to the method of carbonization, but to the selection of a proper paper before carbonization. Do you find, either in the patent in suit or in the original specification, any direction which, in view of the general state of the art at the date of the application of January 9th, 1880, was sufficient to enable one conversant with the art to select a proper paper for an incandescent electrical conductor, without experiment?

Objected to as incompetent and immaterial.

A. I do not.

232 Q. As a matter of actual fact, how did Mr. Edison and yourself arrive at the selection of a paper which could be used as an incandescent conductor?

Objected to as incompetent and immaterial.

A. By long-continued experiments, made with a very large number of different kinds of paper.

636 233 Q. Do you find, in the original specification of the patent in suit filed January 9, 1880, any description of how the paper intended to be used is to be carbonized?

Objected to as incompetent and immaterial.

A. I do not.

234 Q. Is there anything in the original specification which indicates to your mind that the paper was intended to be shaped or cut into form before carbonization?

Objected to as incompetent and immaterial; and also that the original specification is itself the best evidence.

A. There is not. There is nothing in this original specification that I can see that would tend to show me that any of these substances that were used were shaped in the form before carbonization.

236 Q What, at the date of the application of January 9th, 1880, was understood in the art by the term "carbonized paper"?

Objected to as incompetent and immaterial.

A. The term "carbonized paper" previous to the date of the application of January 9th, 1880, by us at any rate, was applied to paper that had been put into a closed chamber with powdered carbon, and raised to a red heat in the furnace or fire.

236 Q. Did the term "carbonized paper" at that date mean, in view of the general state of the art, paper already carbonized, or paper to be carbonized?

Objected to as incompetent and immaterial.

A. Paper already carbonized.

237 Q. You have mentioned various conditions of carbonized paper essential to the manufacture of a paper incandescent conductor. How, as matter of fact, did Mr. Edison and your-
637 self ascertain these necessary conditions of carbonization?

Objected to as incompetent and immaterial.

A. By a large number of experiments previous to this time. I know of no literature on the subject that was given out at that time, from which we could gain any information more than what was already generally known.

238 Q. In the original specification is there, in your opinion, in view of the general state of the art at its date, any sufficient descrip-

tion to enable one skilled generally in the art to properly carbonize a paper conductor for an incandescent lamp?

Objected to as incompetent and immaterial.

A. The original specification gives no information that would indicate to a man skilled in the art how he should carbonize a piece of paper in order to make a proper carbon for an incandescent lamp.

239 Q. In using woods for incandescent conductors for electric lamps, what would be the effect of cutting the conductor, and especially of cutting a filamentary conductor across the grain of the wood?

Objected to as incompetent and immaterial.

A. I think it would be entirely impracticable to do such a thing.

240 Q. What would be the effect of similarly cutting a conductor at an angle to the grain?

Objected to as incompetent and immaterial.

A. A similar effect would be caused in this case, but not to so great an extent.

241 Q. What practical effect would this cutting at an angle to the grain have upon the life of such a filament as has been and is used in the Edison lamp?

Objected to as incompetent and immaterial.

638 A. The practical effect of cutting across the grain of the filament used in the Edison lamps would be to very materially lessen their life.

242 Q. In carbonizing bamboo for the filaments in the Edison lamps, has it been found necessary to use special means of carbonization, or has it been possible to use the general means known in the art on January 9th, 1880?

Objected to as incompetent and immaterial.

A. There is nothing that was generally known in the art of carbonizing on January 9th, 1880, that is being used to-day in a commercial Edison lamp.

243 Q. Had Mr. Edison *or* yourself, prior to January 9th, 1880, made any special experiments as to the carbonization of paper by methods not generally known in the art?

Objected to as incompetent and immaterial.

A. Yes. I believe that our methods of carbonization for the purpose of incandescent conductors for electric lights were known only to ourselves.

Cross-examination by Mr. BROADNAX:

244 X Q. Referring now to "Defendant's Exhibits Batchelor's Note Book No. 52:" Was this book referred to in your examination in the interference case—I mean in the interference case

between Sawyer and Man, on the one side, and Thomas A. Edison on the other?

A. I do not think it was referred to during my testimony in that case.

245 X Q. How recently have you read your deposition in that case?

A. Within the last few days.

246 X Q. And you do not find in that examination any reference to this book, as I understand you?

A. No. I may say that I have just cursorily glanced
639 over it again, and I find no reference to it in my testimony.

247 X Q. In whose handwriting is this book?

A. Almost entirely in my own.

248 X Q. You stated, in answer to question 168 of this deposition, that the book "refers principally to experiments that I carried on for Mr. Edison, in the latter part of 1879." From what period in 1879 does the book refer to experiments carried on by you for Mr. Edison?

A. From July 31st, 1879, to the end of the year. I find the date here, January 2d, 1880.

249 X Q. If there is any part of it which is not in your handwriting, please designate such parts.

A. The following parts are not in my handwriting: Page 1, the initials T. A. E. are in the handwriting of Thomas A. Edison. The next page is all in my handwriting except the initials T. A. E. in Edison's writing. Page 5, the first 13 lines are in Edison's writing; the remaining four are in my handwriting. The date and my name are in my handwriting at the top, and the initials T. A. E. are in Edison's writing. Page 7 is entirely in my own handwriting except the initials T. A. E. Page 9 is entirely in my handwriting except the initials T. A. E. in Edison's. Page 11, all the writing on this page is in the handwriting of Thomas A. Edison. The drawings on this page I believe were made by myself; 13 is entirely in my handwriting except the initials T. A. E. in Mr. Edison's handwriting; 15, drawings and writing entirely mine, except the initials T. A. E. in Edison's handwriting; 17, sketch and writing entirely in my handwriting; the initials T. A. E. in Edison's. Page 19, the handwriting is entirely mine except the initials T. A. E. in Edison's handwriting. Page 21, handwriting entirely mine except the initials T. A. E. in Edison's. Page 23, handwriting entirely mine except T. A. E. in Edison's. Page 25, handwriting entirely mine except initials T. A. E. in Edison's. Page 27, handwriting and sketch entirely mine. Page 29, handwriting entirely mine
except the initials T. A. E. in Edison's. Page 31, hand-
640 writing entirely Edison's except my name in my own hand-
writing; 33, sketch and handwriting entirely mine after initials T. A. E. in Edison's; 35, handwriting entirely mine except initials T. A. E. in Edison's; 37, handwriting entirely mine except initials T. A. E. in Edison's handwriting; 39, handwriting entirely mine except the initials T. A. E. in Edison's; 41, handwriting entirely mine except initials T. A. E. in Edison's; 43, handwriting

and sketch entirely mine except initials T. A. E. in Edison's; 45, entirely my own handwriting except initials T. A. E. in Edison's; 47, entirely mine except initials T. A. E. in Edison's; 49, entirely in my handwriting except initials T. A. E. in Edison's; 51, entirely in my handwriting except initials T. A. E. in Edison's; 53, entirely in my handwriting except initials T. A. E. in Edison's; 57, sketches and writing entirely in my handwriting except initials T. A. E. in Edison's; 58, writing entirely mine except initials T. A. E. in Edison's; 61, writing and sketches entirely mine except the initials T. A. E. in Edison's; 63, writing entirely mine except initials T. A. E. in Edison's; 65, writing entirely mine except initials T. A. E. in Edison's; 67, writing entirely mine except initials T. A. E. in Edison's; 69, writing entirely mine except initials T. A. E. in Edison's; 70, the figures entirely in my handwriting; 71, entirely in my handwriting except initials T. A. E in Edison's; 73, writing and sketch entirely in my handwriting except initials T. A. E. in Edison's. There is a faint initial J. A. R.; this, however, I do not know the meaning of; 74, the writing, what there is of it, is Edison's; 75, sketches and figures in Edison's handwriting; 76, sketches—I do not know the writing; 77, writing entirely mine; 79, writing entirely mine; 81, writing entirely mine; 83, writing entirely mine; 84, the figures almost all my own, but of no consequence; 85, writing entirely mine. One or two of the sketches mine. The rest of the sketches—the ones relating to carbon spirals are Edison's; 87, the writing entirely mine; 89, the writing entirely mine; 91, writing and sketch entirely mine; 92, writing and sketch entirely Edison's; 93, writing and sketches entirely mine; 95, 641 writing entirely mine; 97, writing entirely mine; 99, writing entirely mine; 101, writing and sketches entirely mine; 103, writing entirely mine; 105, writing and sketches entirely mine; 107, writing entirely mine; 111, writing entirely mine; 113, sketches entirely Edison's; 115, writing entirely mine; 117, writing entirely mine except the letters "D. N. C., March 23, 1883;" 119, entirely my handwriting; 121, entirely my handwriting; 122, entirely in my handwriting; 125, entirely in my own handwriting; 127, sketches and writing entirely mine; 129, sketches and writing entirely mine; 131, sketches and writing entirely mine except "D. N. C., March 23, 1883;" 132, figures in my own handwriting; 133, sketches and writing entirely mine except "D. N. C., March 23, 1883;" 135, sketches and writing entirely mine except the writing "D. N. C., March 23, 1883;" 137, writing entirely mine; 139, writing entirely mine except the signature of A. P. Poinier.

250 X Q. Who is he?

A. He was a young man who was experimenting with us at that time. He was one of my assistant carbonizers.

Page 141, sketch and writing entirely mine except the signature of Poinier; 143, sketch and writing entirely mine except the signature of Poinier; 145, sketches and writing entirely mine; 146, disconnected words, I do not know in whose writing; 147, sketches and writing entirely mine; 149, writing entirely mine; 151, writing entirely mine except the signature of Poinier; 153, writing entirely

mine; 155, signature and writing entirely mine; 157, sketches and
writing entirely mine; 158, the writing entirely Edison's except a
few figures of mine; 159, writing and figures are Edison's, a few in
some one else's hand that I do not know; it is the item "365 x 13;"
161, writing entirely Edison's; 163, writing entirely mine; 164, sketch
all mine; 165, writing entirely Poinier's; 166 and 167 are two sketches.
I am not sure who made them nor what they represent; 168, figures
entirely by Edison, relating to electric light stations; 169, entirely
642 my own handwriting except the addition of 38,000 to 10,000
in figures in Edison's handwriting, and the letters "D. N. C.,
March 23d, 1883;" 171, entirely in my handwriting; pages 173,
175, 177, 178, and 179 are entirely in my handwriting; 181, entirely
in Poinier's writing; 183, sketches and writing entirely my own
except Poinier's signature in his handwriting, T. A. E. in Edison's
writing, and J. Seymour in Seymour's handwriting; Seymour was
also an assistant; 185, entirely in my handwriting; 187, entirely in
my handwriting; 188, numerous sketches made by Mr. Edison; 189,
entirely in my handwriting; 191, sketches and writing entirely
mine; 192, figures—I am not quite sure of them; they do not, however, denote anything that I know of; 193, sketches with no signature, I am not sure whether they are Edison's or my own; 195,
entirely in my own handwriting; 197, unfinished sketch, I am not
sure whether in my hand or not; 198, sketches and writing in
Edison's handwriting; 199, the sketch I do not know; 200 and
201, immaterial sketches, no signature, and I do not know who
they were made by; 203, I believe is in Sawyer's writing, the first
part of it has been written backward, so I am not quite sure; I
recognize the latter part; 205, entirely in my own handwriting
207, sketches and writing entirely mine except Poinier's signature, in his own; 209, entirely mine except Poinier's signature, in
his own handwriting, 211, entirely in my own handwriting.
Pages 212, 213, 214 and 215, sketches, with a few figures—all
in Edison's handwriting; 219, entirely in my own handwriting,
220, sketch made by me; 221, entirely in my own handwriting;
223, entirely in my own handwriting; 225, entirely in my own
handwriting; 226, figures in my own handwriting; 227, entirely
in my own handwriting; 229, entirely in my own handwriting;
230, sketches—I do not know whose they are; 231, entirely in my
own handwriting; 232, figures in Edison's handwriting; *232, figures in Edison's handwriting;* 233, entirely in my own handwriting;
234, rough sketches; I am not sure who made them; 235 entirely
in my own handwriting; 237, entirely in my handwriting;
643 239, sketch and writing entirely mine; 241, entirely in my
own handwriting; 242, entirely in my handwriting; 244,
sketches very much like Edison's; I am not quite sure; 245,
entirely in my own handwriting; 247, sketches and handwriting mine; 248, figures all in Edison's writing; 249, figures, all
of them Edison's; 250 and 251, figures, all of them Edison's;
253, sketch and writing entirely mine; 254, figures, Edison's;
255, my handwriting; 256, a few figures that I am not sure of;
all the handwriting is of Edison's; 257, entirely in my own

handwriting; 258, sketch I believe is Edison's; 261, sketch, looks like mine; 262, all my handwriting; 263, all in my handwriting; 264, sketches and writing mine; 266, sketch and writing mine, except the word "these." 267, writing purposely made indistinct. I do not know who wrote this. It does not relate to anything in regard to paper carbon. 268, sketches; I do not know whose; 270 and 271, sketches; I do not know who made them; 272, sketch and writing entirely mine, except the word "pump" and "30 inch" in Edison's handwriting; 273, sketch I am not sure of; the figures are Edison's; 274, sketch and handwriting mine; also some figures of Edison's near the bottom; 275, a few figures of mine; with handwriting and figures of Edison; 276, sketch and writing entirely mine; 278, sketch and writing entirely mine, with few figures of Edison's on the bottom; 279, writing and figures on top part of page mine; figures on bottom part of page Edison's; 280, sketches at bottom I am not sure of. That is all.

251 X Q. The writing and figures on the several pages of this book—are they in lead pencil or in ink?

A. Some of them are in lead pencil and some in ink.

252 X Q. Please to designate the pages that have the figures and writing in ink?

Objected to by counsel for defendant, because the book being already in evidence, it is sufficiently apparent upon the face which entries are made in pencil and which in ink; and unless some 644 special object is made to appear, the cross-examination is trivial and immaterial; if any object material to this inquiry is stated, no objection will be made.

Counsel for complainant states that it appears that great deal of the writing is in lead pencil, and being so is easily effaced or changed; and he wishes it therefore to appear on the record, so that in case of the book being lost or mislaid, or any question arising as to its contents, it may be determined by the facts on the record.

A. All the pages are numbered in ink. The pages in which the subject-matter appears partly or wholly in ink are as follows: 73, 105, 107, 117, 119, 121, 123, 125, 127, 129, 137, 139, 141, 143, 145, 146, 147, 149, 151, 153, 165, 171, 173, 175, 177, 178, 179, 181, 183, 185, 187, 189, 191, 195, 203, 205, 207, 209, 211, 219, 221, 223, 225, 227, 231, 239, 245, 247, 253, 255 and 263. And that is all.

253 X Q. Why are the pages of this book that are in your handwriting signed by Mr. Edison with his initials?

A. Because Mr. Edison had given me the original instructions to make these experiments, and was keeping watch over them all the time. He would frequently sit down with me and help me for hours. Whenever he saw me entering anything in the book he would generally put his signature to it.

254 X Q. Do you wish to be understood as saying that the facts noted in this book, whether they are in your handwriting, or in Mr. Edison's handwriting, or in the handwriting of any of your assistants, were noted as of the acts and doings of Mr. Edison himself, the same as if Mr. Edison had made them himself?

A. Yes, sir; the general instructions for all experiments came from him.

255 X Q. And, as I understand you, the facts in this book are a record of the experiments either made by Mr. Edison himself, in his own proper person, or by you and your assistants, for Mr. Edison, of inventions made by Mr. Edison. Is that correct?

645 A. They were records of experiments made by Mr. Edison and myself, and my assistants, all of which tended towards carrying out the instructions of Mr. Edison in regard to incandescent lighting.

256 X Q. And were the experiments noted in that book made at the time that the experiments were noted?

A. In regard to my own signature, it was always placed there on the date that I had finished the experiment, as far as my part of it was concerned. Mr. Edison's signature, wherever it appears, was placed on at the same date as mine, where it appears with mine. Our general rule with all our assistants was to sign the experiments at the time they were making them.

257 X Q. Are the dates of the several entries given in the book?

A. I do not understand that.

258 X Q. Is the dates under which the notes were made on the book given in the book?

A. Generally, through the book.

259 X Q. And are the facts noted in the book true?

A. As far as I know they are. Where I have made deductions from experiments they are made from the best knowledge that I had at the time.

260 X Q. What I want to know is whether the book is a true record of the facts noted, as you understood them, at the time that the notes were made.

A. They are a true record of facts at the time that they were made. They are not by any means the only record, as that book is only one of a large number of books that were used on the same general line of experimenting, but in different parts of the establishment. I will illustrate that by saying that you find very few records in that book of the difficulties or troubles attending the mounting of those particular carbons into their glass globes. This part of the work would be recorded in a book that was kept in the glass-blowers' establishment. Similarly, not all details of carbonization can be found here; only such as were useful for my purpose to guide me in making another lamp at that particular bench; 646 also, the behavior of such lamps on the pumps. You will find only a few of the deductions that could have been made, and have been made in other books, recorded in that book.

The last part of the answer is objected to by counsel for complainant as voluntary and irresponsive.

261 X Q. How long was it after your examination in the interference case before you found this book?

A. I never found it. The first time I saw it since I went to

Europe in 1881 is last Sunday, when it was brought to the laboratory for me to see whether I recognized it.

262 X Q. At what time in 1881 did you go to Europe?

A. I went somewhere about February, 1881, the first time.

263 X Q. How long before that did you see this book?

A. I do not remember particularly seeing that book any more than any other of our large number of experiment books after the date of the last record in it. It is very probable that I used it frequently for reference, at the time we were working, on the subject.

364 X Q. In your answer to question 170 you state that "the latter part of the book consists mainly of lamps with incandescent conductors of carbonized paper, and of these lamps there were a great many made, as many as seven or eight hundred of them being used in Menlo Park at one time." Were these lamps, made of paper carbon, as stated by you, good, practical lamps?

A. They were very good, practical lamps in the then state of the art.

265 X Q. But not so good as the lamp of to-day, as I understand you?

A. They were not so good as the lamp of to-day.

266 X Q. You also state in the same answer, referring to carbons,
"These were also made of powdered electric light carbon,
647 which was made into a pasty mass, then rolled up in the
form of a thread, carbonized and placed in lamps." Did you
consider these lamps also good, practical lamps in the then state of
the art?

A. In the then state of the art we did not consider them so good a lamp as we wanted.

267 X Q. That does not answer my question. Please to answer it categorically, whether the lamps were considered good, practical lamps in the then state of the art?

A. They were better lamps than had been made before. They were not sufficiently practical to put out as a commercial lamp.

268 X Q. You also state in the same answer as follows, in regard to carbon experiments: "I find that we made these incandescent conductors October 7th, 1879, carbon spirals. These were made from paper tarred—rubbed with tar and lamp-black and rolled into the shape of a thread. They were then wound in a spiral form on a special device for that purpose, carbonized, and afterwards put into lamps." How did lamps fitted with these kinds of carbon perform? Were they as good as the lamps made of plain paper?

A. They were about the same as the lamps made of plain paper previous to this time.

269 X Q. Referring now to these paper carbons of plain paper, of tarred paper, and of the pasty material referred to by you, how did they compare with the incandescent electric lamps of the present day?

A. They cannot compare at all.

270 X Q. They were very much inferior, as I understand you?

A. They were very much inferior, and they were much more difficult to make.

271 X Q. In the same answer you say, "At the same time we made lamps having carbonized conductors from vulcanized fibre." What do you mean by " vulcanized fibre "?

A. Vulcanized fibre is a material well known in the market, and
used by electrical men as an insulator where they do not re-
648 quire such high insulation as rubber. It is practically made
by only one or two concerns, in Wilmington, Delaware. It
is, I think, paper that has been partly parchmentized by treating with chlorate of zinc, and pressure, and is generally a hard, compact mass.

272 X Q. In the same answer you say that you also made carbonized conductors for your lamps from "threads" rubbed with tarred lamp-black, soft paper, fish line, fine threads plaited together in strands, soft papers saturated with tar, tar and lamp-black mixed with a proportion of lime, different kinds of threads, cardboards, cotton soaked in boiling tar." How did these lamps perform. Were they then considered by you as good, practical lamps?

A. They were not considered by us as commercial lamps in any sense. They were simply lamps made in a long line of experiments that we had to do for Mr. Edison.

273 X Q. I do not ask you about commercial lamps. I ask you about practical lamps?

A. My only idea at this date of the practical value of a lamp is its commercial value. A lamp, however, good, is not commercial unless it can be used generally by the public, as we use our lamps to-day.

274 X Q. That is what you mean then, if I understand you, when you say a " practical lamp," or when you speak of a lamp as being a "practical lamp," in connection with your last answer?

A. Some of the above lamps may have been practical lamps if they had been followed, but in the light of to-day I should not consider them, as they burned then, practical lamps.

275 X Q. Did you ever follow up the making of any of these lamps by actual experiments to ascertain whether they could be made good practical lamps, using the word " practical " as you have defined it?

A. Mr. Edison, I believe, has made many experiments on just such materials as these, and some of these are dated far into the time when he had a much better, and a commercial lamp. My experi-
ments did not carry me further on some of these than just suf-
649 ficient to show what is now shown in this book. You will
notice that the thread lamps are carried quite extensively;
but after a really commercial lamp was ready for the market I gave very little attention personally to making experiments on the old substances that we had proved by experiments were not so good as we had got at a later date.

276 X Q. You also state in the same answer that: "Shortly after this I carbonized a great many materials, such as vulcanized fibre, celluloid, boxwood, cocoanut hair and shell, drawing papers of

different grades." How did the lamps made with paper carbons perform? Were they considered good practical lamps?

A. Many of the paper carbons that are spoken of in this book made good lamps at the time. As long as we had nothing better we considered that these lamps were good. That we had not got what was the desideratum for electric lighting is shown by the fact that we discontinued such paper lamps very shortly afterwards in favor of other material.

277 X Q. What material did you adopt as a substitute for the carbons made of paper?

A. The material that we adopted as a substitute was bamboo fibre.

278 X Q. How did the carbons made from drawing paper compare with carbons made from other paper?

A. It depended entirely on the kind of paper that we used. You will find in the book that I have shown you a record of anything that occurred to me at the time; and very many of the card-boards that were carbonized proved to be heavily loaded. The best paper-carbon loop that we could make would be from absolutely pure paper, and cut perfectly even.

279 X Q. As I understand from your answer, the best papers for making carbons for incandescent electric lamps would be paper of pure cellulose as near as you could get it. Is that correct?

A. Paper with the greatest amount of carbonizable matter in it.

280 X Q. That would be pure cellulose, would it not?

650 A. Of course there is no paper to be found that is pure cellulose, but the paper which has the greatest percentage of cellulose in it.

281 X Q. As matter of fact, what kind of an incandescing conductor did the drawing paper make, including all the different varieties of drawing paper used by you? Did it make a good practical lamp?

A. I cannot give you the results of that experiment at present. I do not find it in the book.

282 X Q. Which of the papers used by you made the best carbon?

A. The best paper carbon, as I now remember it, was got from thin bristol-board of a very pure quality. The tests shown on pages 171 to 179 are tests for papers and card-boards for ash; and some of them are so badly loaded that we could not use them at all. The ones that were not loaded at all were generally the better carbons in the lamp.

283 X Q. At that time did you succeed in making carbons from the paper mentioned by you, that you then considered good practical carbons?

A. At this time we had made lamps with paper carbons for their incandescent conductors, which we considered at that time as the best lamps that we had so far got. Time alone proved that there were many far superior, which we got shortly afterwards.

284 X Q. You do not answer my question, which I now repeat: Please state whether at that time you made carbons from the paper

mentioned by you, that you then considered good practical carbons. I am referring, of course, to that time.

A. We considered them more practical than any carbons that we had then made; but that did not deter us from continuing to look for something far superior.

Adjourned to March 9th, 1889, at 10 a. m.

651 NEW YORK, *March 9th*, 1889.

Met pursuant to adjournment.

Present: Amos Broadnax, Esq., for complainant; Walker K. Griffin, Esq., for defendant.

CHARLES BATCHELOR, being further cross-examined by Mr. BROADNAX, testified as follows:

285 X Q. Do you mean that you had a carbon made of paper that was a fairly good carbon, but did not quite satisfy you, and you therefore continued to look for something better, and persevered until you got it?

A. Yes.

286 X Q. Of what material, in your opinion, can you make the best illuminating conductor for an incandescent electric lamp? I do not, of course, inquire about anything that you or Mr. Edison may have done that is not known to the public?

A. The best conductor for a commercial incandescent lamp that has been tried commercially is, in my opinion, the bamboo fibre.

287 X Q. And that is a fibrous carbon, so called, is it not?

A. That is a carbon made from fibrous material.

288 X Q. And in the course of practice and experiments growing out of the invention of the paper carbon, as I gather from your testimony?

A. No, sir. Paper carbon was only one of many substances in that long chain of experiments to get the desired result.

289 X Q. Which was the first fibrous material out of which you made an illuminating conductor for an incandescent electric lamp?

A. I cannot say which was the first fibrous material that I took to make a carbon for an incandescent lamp, whether of thread or tissue paper. I did not consider the lamp that I made for Mr. Edison in 1877 as made especially by me from fibrous material.

The last part of the answer is objected to by Mr. Broadnax as irresponsive.

652 290 X Q. Whatever the fibrous material was of which you made the first incandescent conductor for an electric lamp, as I understand you, you continued from that time on to experiment with different kinds of fibrous material for making illuminating conductors until you settled down on the bamboo carbon?

A. We continued to experiment on fibrous material, but we did not cease to experiment on the other material, as the book will show.

291 X Q. But you adopted the bamboo as yielding the best results, as I understand you?

A. We finally adopted the bamboo as being the best adapted, as known at the time, to the requirements of Mr. Edison.

292 X Q. Was it the discovery that an illuminating conductor for an incandescing electric lamp could be made of fibrous material that l*ead* you to the long series of experiments of which you have testified, to ascertain which of the fibrous materials would make the best conductor?

A. I do not so take it. The bamboo fibre we found after long search had those qualities which were wanted in greater perfection than any other kind of carbon that we had tried before.

293 X Q. If the discovery that a good illuminating conductor could be made of some fibrous material had not been made, was there anything else that could have led you to make the long series of experiments to ascertain out of which of the fibrous materials the best carbon could be made?

A. I do not think that fibrous material, as fibrous material, gave Mr. Edison much clue to what he was working for. I remember lamps made of lamp-black and tar (that was rolled out very thin), that have worked infinitely superior to hundreds of fibrous lamps that were made.

294 X Q. You have testified that Mr. Edison, and you as his assistant, have made a long series of experiments to get a better illuminating conductor of fibrous material. Now, if the discovery that an illuminating conductor could be made of paper, or
653 similar fibrous material, had not been made, what could have led you to make this long series of experiments?

A. Whether we had ever used a carbon made from paper or not, I think we should naturally have got on to the vegetable growths, because there are so many thousands of different forms, all of which carbons could be made from, and each one of which had its own peculiarity; and from so many thousands of them it was almost a sure thing that we could find some that were good. On the other hand, it is the most likely place to find good carbons in great diversity. The other sources of carbons are rather limited.

The answer is objected to by Mr. Broadnax as irresponsive.

295 X Q. Is it not true as matter of fact that your investigation in these different kinds of vegetable fibres was entered upon after you had discovered that you could make a good illuminating conductor for an incandescent electric lamp from paper, or some similar fibre?

A. It is true that we got good results from bamboo fibre, after having the knowledge that incandescent lamps could be made with paper carbon; but it does not follow that the paper carbon was a means of our commencing those experiments. I put carbons made from paper into a lamp for Mr. Edison almost two years before, and he did not immediately tell me to make him some bamboo lamps from that. It was only to my mind after a long series of experiments that he found that bamboo had that particular quality that he wanted.

The answer is objected to by Mr. Broadnax as irresponsive.

296 X Q. At the time that you discovered that a good illuminating conductor could be made of paper, did you not think that you had made a discovery of great value?

654 A. We thought that we had made a discovery of value; the fact that we abandoned it later shows that we had found something much better.

297 X Q. At the time you discovered that you could make a good illuminating conductor of fibrous material did you not think (you and Mr. Edison) that you had made a discovery of great value?

A. At the time we were making incandescent conductors from paper we believed that we had something much more valuable than it proved.

298 X Q. (Last question repeated.)

A. We thought we had made a discovery of value.

299 X Q. But not of great value, as I understand you.

A. I do not know what Mr. Edison thought about it. I thought it of value; how valuable I did not know.

300 X Q. Did you think it was worth following up until you had proved its value?

A. We thought it worth while to, and did follow it up, and proved it of no commercial value.

301 X Q. Do you mean that you proved that an incandescent conductor made of fibrous material possessed no value?

A. No; I mean that we proved to our own satisfaction that paper was not anything like so good a material to make carbon for incandescent conductors as other things.

302 X Q. You will please to observe that my question does not refer to paper at all as a specific form of fibrous or textile material. The question refers only to fibrous material. With this explanation, my question is repeated (297 X Q. read): "At the time you discovered that you could make a good illuminating conductor of fibrous material, did you not think (you and Mr. Edison) that you had made a discovery of great value?"

A. At the first time that we had made an incandescent conductor of fibrous material, we thought that that discovery had considerable value. I do not know that we attached any of that value to the fact of its being fibrous material. As I have testified before, in answer to question 37 of my direct examination, my under-
655 standing of what Mr. Edison wanted was that the requisite material for his incandescent lamp must have great resistance combined with the least possible surface; and that we were expected to get a substance for an incandescent conductor that would give at least five hundred ohms resistance. I also testified in the same answer that our conversations about that time were frequently directed to getting the highest resistance in the least possible space; and, as I remember it now, I do not believe that the

fibrous nature of the carbon entered into the question at all. In fact our experiments show that we had equally as good carbons, at the time of their being made, from non-fibrous material, as from any other.

Mr. Broadnax objects to, and gives notice of motion to strike out as irresponsive, all of the answer commencing with the words "As I have testified before in answer to question 37."

303 X Q. Do you mean to swear that the discovery that illuminating conductors for an incandescent electric light could be made of fibrous material, was not a discovery of great value?

A. As far as my knowledge is in regard to conductors for incandescent lamps, I am sure that their fibrous nature as such was not the great discovery in electric lamps. I would illustrate this by the fact that very many, in fact the greatest proportion of carbons for incandescent lamps I have made from woods where the fibrous material was absolutely worthless.

Mr. Broadnax objects to the answer commencing with the words, "I would illustrate this by the fact," and gave notice of motion to strike out.

304 X Q. You have testified that at the time that the paper carbons were first made by you, you had made incandescent conductors of other material that were equally as good or better than the carbons made of paper. Were those carbons made of any of the materials you have mentioned in your examination here?

656 A. I said, at that time, yes, sir.

305 X Q. Which of them?

A. I do not remember at this time that a paper carbon was thought any better than some of the ones that I have mentioned, as follows: vulcanized fibre; threads rubbed with tarred lamp-black; soft paper; fish line; fine thread plaited together in strands; soft paper saturated with tar; tar and lamp-black mixed with a portion of lime; different kinds of thread; card-boards; cotton soaked in boiling tar.

306 X Q. All those you have enumerated are fibrous carbons, excepting the tar and the lamp-black carbon. Did you find that carbon as good as those made of fibrous material in whole or in part?

A. To the best of my recollection those carbons were as good as the others made at that time.

307 X Q. How many of them did you make?

A. There were only a few of them made at that time.

308 X Q. Did you ever put out any lamps with such carbons?

A. I do not think so. I presume you mean by "putting out" giving them to the public to use, or selling them to the public to use.

309 X Q. Why did you discontinue the making of such carbons?

A. I do not think that I can say that we have ever discontinued the making of carbons of lamp-black and tar.

310 X Q. How many such carbons have you made in the past two years?

A. I have made none myself during the last two years.

311 X Q. How many have you made the last five years?

A. I made some carbons, I think, in 1883—at my factory in Paris, of such materials to be used to illustrate lamps made on that principle, in a lawsuit or interference suit, in London.

312 X Q. You made them by way of experiments?

657 A. I made them to show that they were practical lamps.

313 X Q. Commercially practical?

A. Not commercially practical in the sense of our present lamp, but that they would give light, and burn for a considerable time.

314 X Q. How many of them did you make?

A. I think about a dozen of them.

315 X Q. You made them to use as exhibits in a lawsuit in London, as I understand you?

A. I do not know whether they were used as exhibits, but I made them at the request of either the Edison Light Company of London or of their lawyers.

315 X Q. Are all of the Edison lamps now put upon the market fitted with illuminating conductors made of fibrous carbons?

A. All of the Edison lamps made by the Edison Company are fitted with conductors made from carbonized vegetable substances.

317 X Q. Are they cut into form before carbonization?

A. I do not think so. My understanding of them is that they are cut to a shape, then bent into their form and then carbonized.

318 X Q. You mean by your last answer that the illuminating conductors are made to the desired form and size before they are carbonized?

A. They are made to the desired form and to a certain size; after they are carbonized they are smaller.

319 X Q. You have testified that since the discovery of the fact that a good carbon conductor could be made of vegetable fibrous material you have spent a great deal of time and effort to ascertain of what fibrous material you could obtain the most satisfactory illuminating conductor. How much time and effort have you spent to ascertain whether an equally good illuminating conductor could be made of materials non-fibrous?

A. In proportion to the variety of conditions of carbon that you can make from vegetable substances to those substances from which you can procure suitable carbons for making incandescent
658 conductors that are not vegetable, I should say that a very large amount of time has been spent in trying to procure a carbon from non-vegetable substances. As we can make carbon from almost all vegetable substances, and as our other sources of carbon in proportion are very much limited, it follows that a great deal more time has been spent in total on those carbons than on those from non-vegetable substances.

320 X Q. What success did you meet with in your efforts to make satisfactory carbons from non-vegetable substances?

A. As experiments they were successful.

321 X Q. Were they so successful as to warrant you in putting any lamps on the market provided with such carbons?

A. I do not remember that we have ever put such lamps on the market.

322 X Q. If you have made any lamps with such carbons since your first use of paper carbons, state if you recollect how many you have made?

A. I have answered this before in the lamps that I mentioned that I made in Paris.

323 X Q. Did you ever make any in this country?

A. None except the ones that were made and spoken of in my exhibit book No. 52.

324 X Q. What do you mean by the "bell" of the lamp?

A. If it is in an answer relating to the sketch of the Sawyer-Man lamp, I mean the bell jar or enclosing globe of the lamp.

325 X Q. Is it your opinion that it is impracticable to fuse a glass disc and the bottom of the enclosing globe or lighting chamber of the Sawyer-Man lamp?

A. It is impracticable to fuse the glass disc onto the bottom of the enclosing globe of such a lamp as is shown in the Sawyer-Man patent. I do not say that it is impossible to do so, but, as I testified before, the unequal contraction in the cooling of such a globe after fusion, would be very detrimental; and a very large percentage of them would crack at the point where the glass is smaller in section than the large plate.

659 326 X Q. I do not say anything in my question about the thickness of the glass disc to be fused on the bottom of the lamp.

A. I presume that you referred to the lamp that I have testified about, and of which there was a drawing here at the time, in the specification.

327 X Q. Assuming the glass disc to be of equal thickness with the globe of the lamp?

A. I think that it is then a difficult operation, compared with the ordinary method of sealing the parts of the lamp together.

328 X Q. Is it your opinion that it would be practically impossible?

A. I do not say that it is practically impossible, but a good commercial lamp would never be made that way, as the state of the art at present gives us much better means.

329 X Q. At the time that the application for the patent in suit was made, was there any novelty in making the enclosing chamber of the lamp of glass, and then fusing the two parts together?

A. At the time of this application (which is January 9th, 1880), the process for use in an incandescent lamp was novel, and only used to my knowledge by Mr. Edison.

330 X Q. Was there any novelty in making such a lamp in the summer or fall of 1878?

A. I do not know. I do not remember any such lamp being made in 1878, by anybody.

331 X Q. Do you not know that the chamber or enclosing globe

of an incandescent electric lamp had been made wholly of one piece of glass, having their electrodes passing through holes in the bottom of such lamps?

Objected to as incompetent on cross-examination, not being based on anything in the direct.

A. At what time?
332 X Q. In 1878.
A. I do not know of any such lamp having been made in 1878.
660 333 X Q. Did you read the deposition of Mr. Sharp, for the defendant, in this case?

Same objection as X Q. 331.

A. I did not.
334 X Q. Is it your understanding that the incandescing conductors claimed by the patent in suit are limited to their use in the particular lamp, or form of lamp, described in or referred to by the patent in suit.

Same objection as to the last question; and also as immaterial.

A. I have no particular understanding or opinion in the matter as regards its being confined to anything. I find that, although expressed differently, it is practically the same thing as the lamp made by me for Mr. Edison in 1877.

The last sentence of the answer is objected to as irresponsive.

335 X Q. Was it not old, in 1878, to make glass bulbs of the same form substantially of the bulbs or enclosing chamber of the Edison lamp?

Objected to as improper on cross-examination, not being based on any fact or circumstance brought out on the direct.

A. I do not remember to have seen any globe of that particular shape. I think that those globes were especially made for us, and they have been known as the Edison patent, almost always.
336 X Q. Was it not old, in 1878, to seal the leading-in wires for an electric circuit in the walls of a glass-enclosing bulb or chamber.

661 Objected to for reasons last stated; and also that it does not appear that the witness is qualified to speak of the state of the art in the particular respects requested of him by counsel for complainant.

A. It was not old in 1878 to use an enclosing globe having wires sealed into the glass, which wires were coated together by an incandescent conductor.
337 X Q. (Last question repeated.)
A. If you refer to such specific instruments as Geysler tubes, they were known in 1878.
338 X Q. I do not refer to any particular specifical instrument,

but simply want to know whether it was old in 1878 to seal an electrical conductor in the walls of a glass-enclosing chamber?

Same objection as to X Q. 336.

A. I think it was old. I have seen such instruments.

339 X Q. Have you ever read the specification of Mr. Edison, making part of the application which was involved in the interference with Sawyer and Man, and as to which you gave your testimony?

A. I have given testimony on it, I presume. I have read it, but I do not recall it to my mind. I would probably know it if I saw it.

340 X Q. Do you mean by your last answer that you do not recollect of having read that specification?

A. I do not recollect to have read that particular specification at present. If I have testified on it I believe I have read it; but I do not now recall it to mind. (Said specification is handed to the witness.) I have now read the specification referred to.

341 X Q. Is this the first you have read it?

A. I do not think so. I believe I have read that before.

342 X Q. In answer to question 237: "You have mentioned various conditions of carbonized paper essential to the manufacture of a paper incandescent conductor. How, as matter of fact, did Mr. Edison and yourself ascertain these necessary conditions of
662 carbonization?" you answered: "By a large number of experiments previous to this time; I know of no literature on the subject that was given out at that time from which we could gain any information more than what was already more generally known;" do you mean, or did you mean at the time that the notes were made in the book?

A. Yes; at the time that the notes were made in the book.

Redirect examination by Mr. GRIFFIN:

343 Q. Is it within your general knowledge whether or not commercial lamps are commonly on sale, in which the incandescent conductors are made of non-fibrous material; if so, please state what materials you know are commonly understood to be used by manufacturers or vendors of incandescent lamps in this country?

Objected to as incompetent and immaterial.

A. It is commonly understood that the U. S. Electric Lighting Company make a lamp of tamadine. This I believe to be a non-fibrous material. I believe also in England I have read of their using lamps from a substance which is non-fibrous, and which is squirted through a die into a liquid, which precipitates it. My impression is that these lamps were on the market. Outside of these I do not remember any others.

344 Q. Mr. Broadnax in his cross-examination spoke of Mr. Edison's discovery that conductors of fibrous carbon could be used in incandescent lamps; at the time that Mr. Edison was using paper carbon, did he attach any importance to the fibrous nature of paper,

or discuss with you in — way any advantages due to its fibrous quality?

Objected to as incompetent and immaterial.

A. I do not think he attached much importance to its fibrous quality. His conversations with me at the time were always
663 in regard to finding a material or substance from which we could get a carbon that would be practical, of extreme smallness of cross-section, with length which would naturally give high resistance. As I understood, whether we got it from one thing or another was immaterial, so long as those conditions were there.

345 Q. What is the common and ordinary source of carbon; is it from vegetable or inorganic matter that it is more generally obtained?

Objected to as incompetent and immaterial.

A. The great source of carbon, in the ordinary expression of the term, is vegetable or has vegetable origin.

346 Q. So far as your experience has gone, has the fibrous quality, so far as the same may exist in vegetable structures, been of any value as such in the construction of electrical conductors for incandescent lamps?

Objected to as incompetent and immaterial.

A. The value that we have found after long experiments in carbons made from vegetable substances, I believe is more in the fact of their having small filamentary cells packed very closely together than in anything else. It took us a very long time to find out those peculiar vegetable fibres that would give us perfect continuity, and the most even and dense structure.

347 Q. Have you found in your experiments that the presence of the fibrous quality in the woods or vegetable substance used by you, was any indication as to the electrical value of the resultant carbon, when used as a conductor in an incandescent lamp?

Objected to as incompetent and immaterial.

A. No, sir. If we could produce a method of making a carbon whereby the solid part would be perfectly dense, and still
664 longitudinally it would be cellular, this would be much better than the carbon we now produce from bamboo fibre.

348 Q. As a matter of fact, in all exog/nous woods that you have experimented upon, as testified to by you upon direct examination, has the fibrous quality of the woods, so far as it may have existed, been of any value in the formation of a carbon conductor?

Objected to as incompetent and immaterial.

A. In the formation of a carbon conductor from such woods, the fibrous nature of it is absolutely detrimental. In fact it makes them worthless.

349 Q. Whatever the real reason may be as to the peculiar merits possessed by bamboo as a material for incandescent electrical con-

ductors, as matter of fact do the same merits exist in all vegetable fibrous material?

Objected to as incompetent and immaterial.

A. No, sir; and in all materials that are manufactured, such as paper, thread, ropes, and such, they do not exist at all.

350 Q. You spoke of Mr. Edison's search for a material having a high resistance and small surface. Did this search begin before or after the use of paper carbon in incandescent lamps?

Objected to as incompetent and immaterial.

A. It began, as far as I know, long before—when he first discovered that it was possible to subdivide the light by that method.

351 Q. In such vacuums as you had the means of creating in the earlier stages of Mr. Edison's experiments, was it possible to prevent any form of carbon from oxidization?

Objected to as incompetent and immaterial.

665 A. Previous to the time when Mr. Edison made lamps having glass globes hermetically sealed (in the sense that we to-day know them to be hermetically sealed), nothing would last when used as an incandescent conductor, for any length of time, compared with the life of lamps now, in such vacuums as we could get then.

Adjourned to Monday, March 11th, 1889, at 11 a. m.

CHARLES BATCHELOR.

Sworn to before me,
[L. S.]

WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

NEW YORK, *March* 11*th*, 1889.

Met pursuant to adjournment.

Present: Amos Broadnax, Esq., for complainant; Walter K. Griffin, Esq., and Grosvenor P. Lowrey, Esq., for the defendant.

HENRY E. VINEING, a witness for the defendant, being duly sworn, testified as follows:

Direct examination by Mr. GRIFFIN:

1 Q. What is your name, age, residence and occupation?

A. Henry E. Vineing; age, 32; residence, No. 842 Franklin street, Philadelphia; occupation, mechanical and electrical engineer.

2 Q. What experience have you had generally in the subject-matter of electric lighting, and in electrical matters generally?

A. I am conversant upon all the subjects pertaining to the electric-light business, covering all the different uses to which electricity is put. My experience dates back as far as 1876. At that time I was employed in England by different parties, and doing work appertaining to laying ocean cables, torpedoes for the British government, and experimenting and assisting in the erection of electric light plants generally for the Siemens Brothers. 666

3 Q. Have you been in the employ at any time of the Consolidated Electric Light Company; if so, please state when and for how long?

A. In the year 1883 (I think that is the correct year; as far as I can remember 1883 is the date; but by referring to the Consolidated Company you can get the exact dates), I was employed by the Consolidated Electric Light Company. I think about the middle of that year I entered their employ. I was engaged to make incandescent lamps for that company, and carbons in the same way.

4 Q. Where was the factory or workshops of the company at the time you were employed by them?

A. The factory was at the corner of Front and Adams streets, Brooklyn.

5 Q. By what company had you been employed prior to your employment by the Consolidated Company?

A. By the Brush Company, in Elizabeth street, New York.

6 Q. At the beginning of your employment with the Consolidated Company, what was the nature of your duties or work for them?

Objected to as incompetent and immaterial.

A. I was engaged by the manager of the Consolidated Company, Mr. William Main, at that time. I called there to get a position, and stated my previous experience in incandescent work with the Lane-Fox people of London; and Mr. Main seemed very anxious to tell me that the company would probably be very anxious to get my services. Next day I was engaged to take charge of their carbon department, and to introduce all the latest or better facilities for making lamps than what they already had, and also to experiment on carbons.

667 7 Q. What kind of carbons was the Consolidated Company using at that time in its lamps?

Objected to as incompetent and immaterial.

A. They were using at that time bamboo carbon, or carbon made from bamboo.

8 Q. What kind of material did you work or experiment upon in making carbons for lamps for them?

Objected to as incompetent and immaterial.

A. I worked on basswood, the same as they use in bass brooms; French whisk, or broom whisk, which they use in whisks for brushing clothes; manilla fibre; Tampica; cotton thread; linen thread; fish lines—hemp fish line, and also sea-grass fish line; and fibre from the willow.

9 Q. How many lamps in all did you make of these various materials?

Objected to as incompetent and immaterial.

A. About two hundred or two hundred and fifty, I should say. I cannot be certain of that number, but it is about that number. It is so long a time ago now that I am uncertain of the number.

10 Q. How long did these experiments continue?

Objected to as incompetent and immaterial.

A. From the time that I entered their employment until some two or three months afterwards.

11 Q. Who directed you to make these experiments with the various materials you have mentioned?

Objected to as incompetent and immaterial.

A. The directions came from the office, through Mr. Main.

668 12 Q. What was the amount of success arrived at by the use of any of these materials which you have mentioned?

Objected to as incompetent and immaterial.

A. In a number of lamps that we made—that I made and experimented on—I found from the use of them that we could not get a lamp that would last any appreciable length of time, that is, a number of lamps out of them. That is, the material they were made of was not satisfactory for the making of a large number of lamps.

13 Q. Were the carbons uniform in quality, or in their life in the lamp?

Objected to as incompetent and immaterial.

A. No; not at all. They varied considerably on account of the almost impossibility of getting the carbons made from whisk and broom of an even diameter all the way up the carbon. It was impossible to get the number of lamps which would be exactly the same, because amongst a bunch of broom of a thousand fibres you would probably get twenty per cent. somewhere near the size you wanted; but even those would not be the same. There would be a difference of diameter which would make a difference in the lamps.

14 Q. Out of the carbons made from the same material, was the duration of the carbon in actual use uniform or different?

Objected to as incompetent and immaterial.

A. The duration of the carbons of about the same or nearly the same gauge, were within ten per cent. of the same duration, provided they were all pumped out at the same time, and had the same treatment, and made out of the same batch.

15 Q. What was the degree of success with the willow carbons, or willow fibres that you have mentioned?

Objected to as incompetent and immaterial.

669 A. That was a very short experiment that we tried. We found in a very short time that it was practically impossible to make carbons at all from that on account of the fibre being so coarse in the willow, and it being so easily broken; we could not cut it down fine enough to make a carbon of it.

16 Q. At the conclusion of your experiments for the manufacture

of these lamps of the various materials you have mentioned, what material was adopted, if any, by the company for the manufacture of their carbons for incandescent lamps?

Objected to as incompetent and immaterial.

A. They decided to go on using bamboo to make their carbons of.

17 Q. What part of the bamboo did they use?

Objected to as incompetent and immaterial.

A. They used the dense part of the bamboo structure underneath the outside surface of the cane.

18 Q. Were you, during the time of these experiments, familiar with the Edison bamboo film?

Objected to as incompetent and immaterial.

A. No, sir.

19 Q. After the adoption of the bamboo by the Consolidated Company did they, to your knowledge, use any other material for the carbon for their incandescent lamps?

Objected to as incompetent and immaterial.

A. Yes. Some time after that I received orders from the office through Mr. Main (I believe from Mr. Garden) to make a number of lamps from paper, to make some experimental lamps out of different grades of paper, which I did.

20 Q. What kind of paper did you experiment upon?

Objected to as incompetent and immaterial.

670 A. I used linen paper, common writing paper, paper made from straw, and bristol-board. I obtained these papers and got them cut at the place in Beekman street of W. E. Spangel & Sons, cut to the size that I required or that I wanted to make carbons of.

21 Q. About how many lamps with paper carbon did you make?

Objected to as incompetent and immaterial.

A. I should say nearly one hundred—about one hundred—somewhere around that number.

22 Q. Did you find any difference in the practical effect of using different papers, or were all the papers the same?

Objected to as incompetent and immaterial.

A. Yes. I found that certain grades of paper were of no good as carbons because they were uneven in their texture, and I found that in carbonizing them, in using these papers, on account of the uneven formation of the paper pulp that the thin places would burn out in carbonization; and when they came out of the oven the parts that did not show perforations by being burned out when I put them in the treating apparatus, these parts that were thin would become of greater heat and take a heavier coating of hydrocarbon gas.

23 Q. Do I understand that the Consolidated Company treated their carbons?

Objected to as incompetent and immaterial.

A. The Consolidated Company treated their carbons at that time by the hydrocarbon process.

24 Q. Describe the process used by them for treating their carbon?

Objected to as incompetent and immaterial.

A. At that time we had a bottle with three necks in it, in which were inserted rubber bungs. The gas passed in from the
671 mains (previously having been passed through the purifying
apparatus to take the heavier hydrocarbon away from the gas), and it was passed up through the bottle and allowed to burn out through the outside bung, through a tube which was lit. The rubber bung in the centre hole had two metallic rods placed in it that carried the gas to the carbon, which was fixed on one end of this rod and immersed in the gas in the bottle. The rods that protruded through this bung was connected with wires on the outside for the purpose of allowing connection being made by flexible connections, so as to pass the current through the carbons.

25 Q. What was the practical result of the test of the one hundred or so paper-carbon lamps that you made for the company?

Objected to as incompetent and immaterial.

A. The result was that they found, or they decided, that the sufficiency of the paper carbons so made rendered them useless for practical use, the efficiency of them being very low, and not only that, but it was very hard to get paper of even texture, and of the number of carbons that were made a very large percentage of them were of no good at *at* all.

26 Q. What was the commercial practical value, in your opinion, from your experience of the various woody matters and fibrous matters mentioned by you, from which you constructed carbons for lamps other than the bamboo carbon?

Objected to as incompetent and immaterial.

A. The commercial value of the lamp was *nil*, for the reason that there was no regularity. We could not possibly make them in irregular grades without a great loss. Consequently the cost of a lamp, if you did get a good one (which you would probably get—one out of a good many that you made), would render the cost of
the lamp so high that it would not be practical to make it.

672 27 Q. I ask you to look at the patent in suit, to W. E. Sawyer and Albon Man, and to the drawing figure 5 of the specification. Did you, while you were with the Consolidated Company, make use of any lamps having a glass disc and a glass chamber with flanges, as shown in that figure?

Objected to as incompetent and immaterial.

A. Yes; to the best of my recollection there were two of those lamps—one to a certainty—that I experimented on, trying to make the carbon burn; it was a pencil carbon, an ordinary electric light carbon, of small diameter. I fixed a lamp similar to this, with a pencil carbon in it, pumped it out, and made it substantially the same as this, and sealed it with different kinds of wax. Mr. Main experimented, and made up different kinds of wax to seal this with. I sealed them, and treated them, but never managed to get any of them to burn for any length of time.

28 Q. How long, to your best recollection, did carbons burn in such a lamp?

Objected to as incompetent and immaterial.

A. Half an hour at the outside.

29 Q. What became of it then?

Objected to as incompetent and immaterial.

A. Several times when we tried that experiment the globes burst.

30 Q. Did you use any cement between the disc and the glass chamber?

Objected to as incompetent and immaterial.

A. Between the disc and the glass chamber they used balsam. Some balsam that they had in the factory at the time was used, or it was procured for that purpose, I believe, by Mr. Main.

673 31 Q. Was there anything additional to the balsam used to affix or attach the disc to the glass chamber?

Objected to as incompetent and immaterial.

A. Not with that lamp that I experimented with.

32 Q. Did you see any lamp at the Consolidated Company having a glass disc and chamber and flange, as shown in figure 5 of the patent in suit?

Objected to as incompetent and immaterial.

A. Yes; I saw some lamps made with a shade—a shade on the lamp similar in size to this; the conductors to the carbon were on a frame; and the outside metal frame was made double; and the glass shade went into this wall which is made between the metal, and is filled in with cement. The metal base was double, and the glass shade fitted into it; and then the space was filled up with cement.

33 Q. Did you find it possible to preserve a vacuum in such lamps?

Objected to as incompetent and immaterial.

A. Not for any length of time.

34 Q. When did you leave the Consolidated Company, or its employment?

Objected to as incompetent and immaterial.

A. I think about ten or twelve months after my engagement with them. I am not certain about that, but it is about that time. All the papers that I had about that time were burned up in a fire that occurred at the place I was employed after leaving there; and I have no dates that I can fall back upon to give you the exact period when I left them: but that is about the time that I was with them altogether.

35 Q. Did you subsequently return to the employment of the Consolidated Company?

Objected to as incompetent and immaterial.

674 A. Yes: I subsequently returned to their employment on my leaving the employment of Messrs. Remington & Son; I think about some time in 1885.

36 Q. What was your employment, or what were your duties at Messrs. Remington & Sons?

Objected to as incompetent and immaterial.

A. I engaged with Messrs. Remington & Sons to start an incandescent lamp factory. I did so, and put out two plants; but the Edison people commenced a lawsuit against the Remington people for infringing their patent, and stopped them.

37 Q. What kind of carbon did you use at the Remington's?

Objected to as incompetent and immaterial.

A. Bamboo.

38 Q. After you had returned to the Consolidated Company, what kind of a carbon were they using for their filaments for incandescent lamps?

Objected to as incompetent and immaterial.

A. Bamboo.

39 Q. How did the lamps compare in their general feature with the lamps of the Edison Company?

Objected to as incompetent and immaterial.

A. The difference between that lamp and the Edison lamp was that instead of the connection between the carbon (the platinum wire), instead of being electroplated, the connection was a connection with cement—carbon cement.

40 Q. What was the original shape of the globes or glass chambers used by the Consolidated Company when you first went there?

Objected to as incompetent and immaterial.

675 A. They were tubes about an inch and a quarter in diameter.

41 Q. How long?

Objected to as incompetent and immaterial.

A. I should say about five or six inches.

42 Q. What shape did they subsequently adopt?

Objected to as incompetent and immaterial.

A. An egg-shaped globe.

43 Q. How did that shape compare with the shape of the Edison Company lamp?

Objected to as incompetent and immaterial.

A. The globes that they used first, after using the tubular globes, were made in a mould. They were of uniform shape—egg-shaped, with a straight neck.

44 Q. How did the shape of them compare with the shape of the Edison Company lamp?

Objected to as incompetent and immaterial.

A. They were globe-shaped. The Edison Company lamp tapered off down; that is, the Edison Company's globes was blown from the end of a blow-pipe, in the factory, and naturally had a gradual taper off down to the end of it; whereas the globes they used practically answered the same purpose, but were made in a mould; and the bottom of the egg shape was elongated to a straight neck, so as to allow the easy sealing in of the inside supporting bulb that they then used.

45 Q. What experience if any had you had in England prior to your employment with the Consolidated Company here, in the making of carbons for incandescent lamps?

Objected to as incompetent and immaterial.

A. I was engaged in the Lane-Fox factory, in London, in
676 the treating-room of that establishment. There I went
through the experiments with the different fibres and woods;
and also with cotton.

46 Q. What success, if any, did you have with ordinary woods?

Objected to as incompetent and immaterial.

A. None whatever. The experiments with those were of very short duration, on account of not being able to arrive at any practical carbon.

47 Q. What was the trouble?

Objected to as incompetent and immaterial.

A. It was impossible to cut the wood down so fine as we wanted it; and not only that, but it was very coarse; and after it was carbonized, it was very porous and uneven and very easy to break, and brittle on account of the cross-fibres in the different woods.

48 Q. Who composed the Lane-Fox Company?

Objected to as incompetent and immaterial.

A. It was the Anglo-American Brush Company—an incorporation; and this was the Lane-Fox department. They were making incandescent lamps under the Lane-Fox patents.

49 Q. How many lamps were they making at Lane, Fox & Co.?

Objected to as incompetent and immaterial.

A. At the time of my employment with them they were averaging some days one hundred, some days two hundred or two hundred and fifty; the average was about one hundred and fifty to two hundred per day.

50 Q. Did the Anglo-American Brush Company carry on incandescent lighting commercially at that time in England?

Objected to as incompetent and immaterial.

677 A. At that time I was not conversant with any permanent installation that they had; but a short time afterwards I left the testing-room, and went and made an installation in the new houses of parliament at Vienna, for that company; and they made an installation also at the Crystal Palace electrical exhibition.

51 Q. Who was the Mr. Lane-Fox of whom you have spoken; and what was his relation to the incandescent lighting subject?

Objected to as incompetent and immaterial.

A. He was the inventor of the Lane-Fox lamp.

52 Q. Was that a lamp similar in form to the lamp at present used by the Consolidated Company, and by Mr. Edison?

Objected to as incompetent and immaterial.

A. It was similar to this effect, that it was a carbonized film, burning in a vacuum, for the purpose of incandescent lighting. The details of construction were somewhat different.

53 Q. At the time that you worked for the Consolidated Company did you receive specific directions as to the kind of carbons you were to use, or what were your directions as to your experiments on carbons for incandescent lamps?

Objected to as incompetent and immaterial, and also as leading.

A. After my experiments, after the first two or three months, when they had found out the value of these different materials, which I had tried, I was told to go on making, to continue making lamps with bamboo carbons in them; carbon made from bamboo.

54 Q. I mean, at the beginning of the service, and before you had made the experiments, what were your directions then, if any?

Objected to as incompetent and immaterial.

678 A. To make lamps of these different materials that I had made them out of when in Lane-Fox employ, and if possible to make a good lamp.

55 Q. Did you succeed in making a "good lamp," to use your own expression, out of any of these materials, except bamboo?

Objected to as incompetent and immaterial.

A. Yes; I succeeded in making a good lamp, but not a practical commercial lamp. I would make one good lamp probably out of fifty or sixty; but it was not at all certain what percentage of good lamps, out of the number I made, would be. Necessarily it could not be called practically a good lamp, on account of there not being any regular percentage of them good.

56 Q. What do you mean by a "commercial lamp," to use your own phrase?

Objected to as incompetent and immaterial.

A. By a commercial lamp I mean a lamp made of a material whereby the life of such lamp is of such duration, and the percentage of lamps made from that material are of such a life as to warrant their being sold at a regular standard rate.

57 Q. Supposing that out of one hundred lamps actually made, twenty of them were good for practical use, and the rest were not good. Would you call that type of lamp a commercial lamp?

Objected to as incompetent and immaterial.

A. I should not call it a commercial lamp, because nothing can be called commercial unless the percentage from the manufacturing is fifty or over.

58 Q. What proportion of the lamps that you made from different materials, other than bamboo, that you have mentioned, were good lamps as regards the duration of the carbon, in any ordinary meaning of the term?

Objected to as incompetent, immaterial and as already answered. Question withdrawn.

679 59 Q. Did you have any conversation with any of the managers of the Consolidated Company as to the adoption by them of the features of the Edison Company's lamps?

Objected to as incompetent and immaterial.

A. Yes. Several times I had spoken both to Mr. Main, Mr. Richardson and Mr. Garden, about the feasibility of adopting another mode of sealing in the bottom of the lamp, on account of being such a great loss from the mode they were then using of sealing in the inside part of the lamp. I asked them a good many times if they would not adopt the same way that Edison did, of supporting the bulb, because there was less loss in that way of doing it, and it was a quicker method.

60 Q. What was their answer?

Objected to as incompetent and immaterial.

A. They said that they preferred to go on in the way they were going on account of not making a lamp too near like Edison's.

61 Q. Finally, what did they do in this respect?

Objected to as incompetent and immaterial.

A. As I said before, they changed from the tubular-shape lamp to the globe, and at the time I left them, the first time, I believe the glass-blower there got up another mode of sealing in; and when I returned to them the second time they were using this new way of sealing in.

62 Q. Was there any substantial difference between that method and the lamp of the Edison Company, except in detail?

Objected to as incompetent and immaterial.

A. The ultimate result arrived at is exactly the same, but the details are not the same.

680 63 Q. What do you mean by saying that the ultimate result was the same?

Objected to as incompetent and immaterial.

A. A glass support for the platinum wires to the carbon to seal in the bottom of the lamp. In Edison's case he used a bulb with a long piece of glass protruding inside of the bulb of the lamp and sealed at the top of this projection; but the Sawyer-Man people have the seal in solid glass, and they inserted in this solid glass the wires that were sealed into it in the bottom of the bulb, so that the projections inside the Sawyer-Man lamp are solid until near the top, while Edison's go a long way in and are hollow.

64 Q. Then, as I understand you, the only difference was in the shape of the glass supporting the wires?

Objected to as incompetent and immaterial.

A. Yes; that is the difference.

65 Q. Did you ever have any conversation with any of the managers of the Consolidated Company as to adopting bamboo carbon, such as is used in the Edison Company lamp?

Objected to as incompetent and immaterial.

A. When I had gone through these experiments that I have already told you about, in my first two or three months' engagement, they decided to make carbon from bamboo fibre; and I received instructions through Mr. Main to go on making lamps, using bamboo fibre for the carbons.

66 Q. After this adoption of bamboo did the company use any other fibre, to your knowledge?

Objected to as incompetent and immaterial.

A. Yes; as I answered before in one of the questions, some time after that I had orders to make some lamps of paper—that is, to make carbons from paper.

681 67 Q. With the exception of the paper carbon, as to which you have already testified, were there any lamps to your knowledge manufactured by the Consolidated Company with any other material than bamboo?

Objected to as incompetent and immaterial.

A. Not that I am aware of.

68 Q. What experience, if any, have you had in glass-blowing,

either personally or as superintendent of the manufacturing of incandescent lamps for electric lighting?

Objected to as incompetent and immaterial.

A. I have been in direct charge of glass-blowers, of two glass-blowers in the Lane-Fox factory, and also I have been in charge of glass-blowers in factories I have been in since then; and I can also make a lamp from beginning to end, seal the glass, and do the whole thing.

69 Q. Please look at the drawing figure 5 in the patent in suit, and state whether in your opinion, and from your experience, it is practically possible to fuse together a glass disc, and the flanges of the glass chamber, as shown in that drawing in the patent?

Objected to as incompetent and immaterial.

A. Is that glass disc supposed to be flat all the time; is that what you mean?

70 Q. I mean a flat disc and chamber, as shown in that drawing.

A. I should say it is impossible.

71 Q. What are your reasons for this opinion?

Objected to as incompetent and immaterial.

A. If this disc is flat and circular, as shown in this drawing, and of the same thickness, I am almost positive that it is a matter of impossibility for any one to seal the tube as shown in this drawing to this glass disc, for the simple reason that immediately they put the heat on that glass it will crack, thereby preventing the making of a seal. 682

72 Q. Have you had any experience in attempting to seal electrodes of different metals through the glass chamber of an incandescent lamp?

Objected to as incompetent and immaterial.

A. Yes; I have sealed copper—I have attempted to seal copper—and steel; by steel I mean steel and iron; besides platinum wire.

73 Q. Did you succeed in sealing efficiently, so as to enable a vacuum to be preserved, either steel or iron or copper electrodes in a glass chamber?

Objected to as incompetent and immaterial.

A. No, sir; never. The trouble with these metals is that they oxidize when the heat is put to them, and cannot make a perfect seal on account of the air bubbles that are formed between the metal and glass inside of the seal, thereby rendering it so that you cannot make a perfect seal. You can sometimes make a seal that will hold a vacuum of a certain strength, say 25 or 26 inches, but higher than that you cannot go; and even with that vacuum it will not hold for any length of time.

74 Q. So far as your knowledge extends, what is the material, if any, now universally used as electrodes, fused or sealed in a glass chamber for electric incandescent lamps?

Objected to as incompetent and immaterial.

A. Platinum and iridium wire. Some use platinum and some use platinum mixed with iridium.

75 Q. Do you understand why platinum is used for this purpose?

Objected to as incompetent and immaterial.

683 A. It is because it does not oxidize and also because its coefficient of expansion and contraction, although not being exactly the same as glass, is the nearest to that of glass of any metal that you can possibly obtain.

76 Q. Have you read the specifications of the patents in suit?

Objected to as incompetent and immaterial.

A. Yes; I have read this several times.

77 Q. Do you find in the patent in suit any direction or description sufficient to have enabled you or any person skilled in the general state of the art, in June, 1880, to have constructed a practical commercial incandescent lamp, having fibrous material as the material for the incandescent carbons?

Objected to as incompetent and immaterial.

A. Unless I experimented I could not make a lamp from these instructions.

78 Q. As matter of fact, when you tried for the Consolidated Company to make a suitable carbon conductor for them out of fibrous material, were you able to make such a conductor without experiments and personal research?

Objected to as incompetent and immaterial.

A. I experimented there to make them, and found that we could not make a lamp that was practical, or of commercial value, unless we used bamboo fibre.

79 Q. In your opinion, and from your experience and knowledge of the general state of the art, was a direction to make an incandescent conductor of carbon fron vegetable fibrous material a sufficient direction, say in the month of January, 1880, to enable one generally skilled in the art to select the material and construct a practical incandescing conductor for an electric lamp?

Objected to as incompetent and immaterial.

684 A. I had no instruction from any one as to what I had to use. I had to use my own previous experience in making lamps for these people.

80 Q. My question is this: Supposing you, or any one equally skilled in the general state of the art of electric lighting in January, 1880, had been told at that time to make an incandescent lamp, having a carbon conductor made from a vegetable fibrous material—would that direction of itself have enabled you to have selected a proper material, and to construct a suitable conductor?

Objected to as incompetent and immaterial.

A. No, sir; not without experiments.

81 Q. Similarly, would a direction to make an incandescent conductor of an arch shape, of carbonized paper, have been sufficient to have enabled you, or others generally skilled in the state of the art, to have selected the proper kind of paper when carbonized, to make the proper conductor for an incandescent lamp?

Objected to as incompetent and immaterial.

A. Not without experiments on different kinds of paper.

82 Q. I ask you the same question with regard to wood carbons. Would that have been a sufficient description or direction?

Objected to as incompetent and immaterial.

A. You would have to experiment on those things to get the right thing.

83 Q. As matter of fact, have you ever been able, or have you ever known of successful incandescing carbon conductors being made out of any of the wood carbons, generally so called—that is to say, carbons of exogenous woods, such as the willow, maple, poplar, oak and similar trees?

Objected to as incompetent and immaterial.

685 A. I have never known of any practical lamp being made of those woods, or of those fibres.

84 Q. How did you come to testify for the Edison Company in this suit?

Objected to as incompetent and immaterial.

A. Through a mutual friend they asked me to testify in this matter, as he knew that I was an expert in the business.

85 Q. When was that?

Objected to as incompetent and immaterial.

A. On Saturday last.

86 Q. When was the first time that you saw any one connected with the Edison Company?

Objected to as incompetent and immaterial.

A. This morning, when I saw yourself.

87 Q. What payments, if any, have been made to you, directly or indirectly, in connection with your giving testimony here?

Objected to as incompetent and immaterial.

A. My expenses have been paid from Philadelphia here, and I understand and expect that my expenses will be paid all the time that I am detained here.

88 Q. Have any promises of any kind been made to you, in any way, by any one connected directly or indirectly with the Edison Company, or any inducement of any sort been made to you?

Objected to as incompetent and immaterial.

A. None whatever.

Counsel for complainant states that it is now three o'clock, and he cannot proceed with the cross-examination until after the 686 short-hand notes (the testimony having been taken in short-hand) are written out; but that he will be ready to proceed with the cross-examination to-morrow morning at ten or half past ten o'clock, as counsel for defendant may elect.

Adjourned to March 12th, 1889, at 10 o'clock a. m.

NEW YORK, *March 12th*, 1889.

Met pursuant to adjournment.

Present: Amos Broadnax, Esq., for complainant; Walter K. Griffin, Esq., for the defendant.

HENRY E. VINEING, further examined by Mr. GRIFFIN, testified as follows:

89 Q. Referring you to your answer to question 27, and to the lamp mentioned by you in that answer, did such lamp have the flanges and nuts as shown in Fig. 5 of the patent in suit?

Objected to as incompetent and immaterial.

A. It had an arrangement to keep the glass globe fastened onto the bottom of the disc. Something similar to what is shown in the patent. Something similar—I cannot say that it was exactly the same; but something similar. It was tantamount to the same thing—for the purpose of holding the glass.

90 Q. What kind of carbon was used in the lamp?

Objected to as incompetent and immaterial.

A. Ordinary electric light carbon, similar to that used in arc lamps, but of smaller diameter than generally used in the present commercial arc lamp.

91 Q. What was the diameter of the carbon pencil?

Objected to as incompetent and immaterial.

687 A. Between one-sixteenth and one-eighth of an inch—nearer one-eighth of an inch.

92 Q. About how long was the pencil?

Objected to as incompetent and immaterial.

A. From an inch down; not longer, I do not think. To the best of my memory it was somewhere about an inch. An inch was the longest carbon.

93 Q. In experimenting with various fibrous substances for the Consolidated Company as to which you have testified, were those substances subjected to any treatment besides the treatment for the deposition of carbon from gas which you have mentioned?

Objected to as incompetent and immaterial.

A. Yes; the fibres before baking had to be treated with a liquid. The French whisk and bass were treated with strong soda water, or caustic potash, for the purpose of getting the outside coat of the fibre.

94 Q. Did you use any other alkali or chemical when preparing the fibres?

Objected to as incompetent and immaterial.

A. I made some few experiments with cotton and parchmentized it with acid.

95 Q. Was this treatment with caustic soda general with all the fibres?

Objected to as incompetent and immaterial.

A. Not general; no. It was a treatment with caustic potash—of bass, French whisk and manilla. I guess those are the only fibres that I treated with that process.

96 Q. Was Albon Man ever present while you were experimenting or working for the Consolidated Company?

Objected to as incompetent and immaterial.

688 A. Yes; he came there two or three times to my memory to see how I was getting on, and what results my experiments were showing up.

Cross-examination by Mr. BROADNAX:

97 X Q. Referring to the carbons made from the material mentioned in answer to question 8, how long were such carbons, and what was the cross-section?

A. Those carbons, in the case of French whisk, as near as I can remember, were from fifteen to eighteen thousandths of an inch in diameter. In the case of broom they were somewhat smaller than that. In the case of the bass they were somewhat smaller, on account of being able to get a larger number of bass fibres in a bunch, smaller than whisk, and the finer the fibre is—generally the fine fibres in a bunch of bass are longer; that is, they are more even, the cross-sections—they are longer and finer. You can get a longer length with an even cross-section, rendering them more desirable for that purpose. In the manilla they were pretty fine; I should say between eight and twelve thousandths of an inch. The length of them varied according to the average grade of the diameter. If I took a batch of fibres of a certain diameter, I would make the length of those (when finished and treated to a certain resistance) to suit the candle power at which I intended to run them. The exact length I cannot tell you. It was between two and three inches.

98 X Q. What was the length of the filament before it was carbonized?

A. In the case of bass it was seventy-five per cent. longer than what it was after it was carbonized. I have told you before, in answer to the original question, that I cannot give you the length; but the shrinkage of the carbon on bass and broom and these fibres averages twenty-five per cent. That is, they were seventy-five per cent. of the length after carbonization that they were before they were carbonized.

99 X Q. What was the length before carbonization?

689 A. As I told you they are between two and three inches.

100 X Q. What kind of lamp did you use these carbons in?

A. Do you mean the shape of the bulb?

101 X Q. No; but in the incandescent lamp—what kind of lamp did you use those carbons in?

A. I used them in the lamps they were making at that time there—with the same shape—a long tubular—a tube about an inch and a quarter in diameter, round at the top, and five inches long. When the lamp was completed the whole thing ranged from four and a half to five inches.

102 X Q. Do you mean that the loop after the carbon was put in the lamp was from two inches to two and a half inches long; or do you mean that the carbon filament, before it was turned or made into loop form, was that length?

A. Certainly; before it was turned. When I speak of the length of a carbon filament I take it from end to end—not from the top of the loop to the bottom and down the leg at one side. The contents of a carbon are found out by multiplying the cross-section by the total length, and not by the height of the carbon; consequently when you say the length of a carbon you take it from end to end.

103 X Q. Was the willow carbon which you made of about the same size and length as you have mentioned?

A. No, sir; I was unable to get any very great length of willow on account of its splitting.

104 X Q. What means did you have for cutting your filament before carbonization?

A. A cutting machine that they used there at the factory for cutting fibres.

105 X Q. What was the length and cross-section of the paper carbons you made?

A. The length of the cross-sections of the bristol-board carbons that I treated were severally twelve, fifteen and twenty-four thousandths of an inch in diameter. There were some other sizes that
I forget exactly the cross-section of. That was the measure-
690 ment one way. The other way was the thickness of the card-
board, which average twelve-thousandths. The length of them from end to end, as near as I can remember—they stood about an inch and a quarter high and two and a quarter inches when mounted.

106 X Q. That would make a loop of about an inch and a half?

A. Yes; the loop would stand up about an inch and a half; some were a little longer, and some a little shorter.

107 X Q. When did you go into the employ of the Lane-Fox people in London?

A. In 1880, to the best of my knowledge. It is so long ago that I am uncertain whether it was 1880 or 1881.

108 X Q. When you say "Lane-Fox," you mean two individuals, do you not?

A. One individual; Lane-Fox was one man.

109 X Q. Who, if any one, did you know that was skilled in the art of making incandescing conductors for electric lamps of fibrous or textile material, in 1878 or 1879?

A. In 1879, I was aware of John Swan, of New Castle, England; George Lane-Fox, a Mr. Parrot of London; and Mr. Grubb, who was, I believe, Mr. Lane-Fox's assistant.

110 X Q. Were the persons you have mentioned skilled in the art of making such carbons?

A. They were skilled in the art as known in those days. How far their skill reached I do not know; but they were experimenting on that matter. What they knew, or how much they knew, I am unable to tell you, at that time. At that time I knew these people, and knew that they were experimenting in this direction. By "skilled in the art" I understand you to mean a man who is in the business of experimenting.

111 X Q. I mean one skilled in making them—one who had learned the art of making them?

691 & 692 A. The art of making perfectly good carbons that were commercially successful, had not arrived, at that period to its solution. Those men that I have mentioned were experimenting all the time.

112 X Q. Who is the mutual friend through whom you was brought to testify in this case?

A. I had some business with a gentleman here in New York on some patents I was getting out; and he was talking several months ago, with Mr. Dyer.

113 X Q. I ask you who he was. I do not care anything beyond that.

The WITNESS: Is it necessary that you should know?

Mr. GRIFFIN: Yes; state who it was.

A. It was Mr. Benjamin, here.

114 X Q. Do you mean Mr. Parke Benjamin?

A. No; I mean Mr. George Benjamin.

115 X Q. The patent solicitor?

A. Yes.

HENRY E. VINEING.

Sworn to before me,
[L. S.]

WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

693 United States Circuit Court, Western District of Pennsylvania.

CONSOLIDATED ELECTRIC LIGHT COMPANY
vs.
THE MCKEESPORT LIGHT COMPANY.

NEW YORK, *March 8th*, 1889.

Testimony taken on behalf of defendant before William T. Farnham, Esq., special examiner, pursuant to notice.

Present: L. E. Curtis, Esq, for complainant; R. N. Dyer, Esq., for defendant.

The witness, Professor CYRUS F. BRACKETT, a witness produced on behalf of defendant, being duly sworn and interrogated by counsel for defendant, deposes and says as follows:

1 Q. What is your name, age, residence and occupation?

A. My name is Cyrus F. Brackett; 55 years old; professor of physics in the college of New Jersey; reside in Princeton.

2 Q. What knowledge have you of the science of electricity, and what experience have you had in the use of electrical instruments and apparatus, more particularly the apparatus used for electric lighting?

A. I have for many years been engaged in conducting investigations in electrical science, in giving instruction to students in all branches of electrical science, and in the course of the discharge of my duties I have had in my charge, and more or less constantly in use, a great variety of electrical apparatus, and am reasonably familiar with the present state of electrical knowledge. I have followed the course of the development of the art of electrical lighting, and believe that I am tolerably familiar with the principles involved and with many of the details of construction of the apparatus actually employed for that purpose. 694

3 Q. Have you read and are you familiar with the patent in suit, namely, letters patent No. 317,676, granted May 14th, 1875, to Electro Dynamic Light Company, as assignees of William Edwin Sawyer and Albon Man, and entitled "improvements in electric lights"?

A. I have read the patent named in the question and believe that I understand it.

4 Q. Please state what is shown in the state of the art by patents and publications, and as matters of general information within your knowledge prior to the year 1878, bearing upon the invention of the patent in suit or material to be considered in connection therewith.

A. Prior to the invention of the voltaic battery by Volta, which was first described in the year 1800, the only artificial appliances which were known for producing the electric light were such as could be utilized in connection with what is commonly known as static electricity or that which is produced by friction, induction, &c. By means of such apparatus it was well known that one could produce momentary electric light by the passage of the so-called electric spark by the deflagration of metals or other conductors through which electric discharges were made to take place. After the invention of Volta, which gave to scientific men a means of producing a steady current or continuous passage of electricity, it became possible to open new lines of inquiry and study. In general these may be grouped under three heads. First, the heat effects of the current which might be carried so far as to produce a vivid light either by the passage of the current from one conductor to another across a space of air, or by rendering metals or other suitable conductors incandescent. 695 Second, the chemical or electrolytic effects of the current, formed a branch of inquiry. Third, after Oersted's discovery in 1819 that the electric current could exert an influence on the magnet, the department of electro-magnetism was created and researches were vigorously prosecuted in it. The particular line of inquiry which has the most immediate bearing on the subject of electric lighting is intimately concerned with the resistance which conductors can offer to the passage of the electric current. Very soon after the publication of Volta's invention, various persons constructed and put in operation voltaic batteries of sufficient size and power to enable them to produce effects quite comparable with those which are now actually exhibited in practice in the art of electric lighting, and accounts of experiments which were conducted by means of such apparatus were published, and now form a part of the recognized body of scientific knowledge appertaining to this art. I may particularly mention some experiments which were published in 1809 which were carried on by means of a large battery in the possession of Mr. John G. Children, an account of which is given in the Philosophical Transactions, volume 9, part first. One of the experiments was conducted with charcoal which was made to burn with an intense brilliancy. In another experiment, not only was charcoal vividly ignited but various kinds of wires were tried in order to ascertain the amount of each which the battery would heat to redness. The apparent object of the experimenter in this experiment was to ascertain the peculiar property or properties which different materials might possess with respect to the conduction of the electrical current. In the year 1815 appears a paper which was read by Mr. Children, June 15th, in which the properties of different metals were made to appear by using them in the form of chains. In these chains apparently the different links were of different metals, and as the same current must evidently traverse them all, those which the current could most easily heat would be raised to a greater or less degree of incandescence, while the 696 others might remain comparatively cool, and thus their relative properties would easily appear. In an apparent attempt to explain the reason for this difference of behavior an experiment was made in which the circuit was completed by means of two pieces of charcoal. The result of this experiment is stated to be that the evolution of heat and light continued so long as the surfaces remained in contact, and the obvious comment is made by Mr. Children that since no contact could be so perfect as to oppose no resistance to electricity, the resistance of the conductor is the occasion of the heat developed. In the same paper an account is given of experiments in which various platinum wires and bars were heated, also Mr. Children states that fine points of boxwood charcoal intensely ignited in chlorine were not altered nor was any alteration produced in the gas. A similar result followed when the ignition took place in nitrogen. Obviously the experimenter's purpose here was to determine whether the emission of light was due to chemical action as in ordinary combustion, and his comment that neither the carbon, nor the chlorine, nor the nitrogen suffered any change was an evident negative answer.

In the year 1820 was published a paper by Mr. Children in which he gives an account of some researches made by means of the arc light produced by means of a voltaic battery as a means of research, and he made the discovery that the chemical union which does not occur between certain mixed gases when kept in the ordinary condition is immediately produced when brought under the influence of the vivid electric light. It appears that in the production of the arc light used in these experiments charcoal points were employed.

Sir Humphrey Davy, in the year 1821, conducted some experiments having for their object to determine the conditions on which the magnetic disturbance due to the electric current which had recently been discovered by Oersted depend. These appear in a paper published in the "Philosophical Transactions," volume 21, 1821. The immediate object seems to have been to determine whether 697 the peculiar character of the conductor itself was the influential element in disturbing the magnet or whether the disturbance depended on the passage of the current through whatever conductor. To this end Davy employed a piece of charcoal which was made to intervene and form a part of the circuit and the compass needle was brought near to it. In the course of another experiment which had for its primary object to determine if the arc itself could affect the magnet, a column of electric light varying in length from one to four inches according to the rarefaction of the atmosphere was produced between points of charcoal. In the same paper also is a record of some experiments to determine the comparative conducting powers of different materials, some of which were fluid, others were solid, including charcoal and various metals. When a piece of well-burnt compact boxwood charcoal was employed having a width of three-tenths of an inch and a thickness of one-tenth of an inch, being suitably connected to large platinum surfaces it was found that one-inch and two-tenths in length carried off the same quantity of electricity as six inches of platinum wire one two hundred and twentieth of an inch in diameter. It appears from this that Davy was early familiar with that property of conductors which we familiarly speak of as their resistance and he saw the relation of this property to the production of heat when a given current is made to pass through conductors made of different materials, including charcoal which he observed had a high resistance compared with metals. In the collected works of Sir Humphrey Davy, published in 1839-'40, volume 2, he described experiments conducted with a battery of one hundred and fifty series of plates of copper and zinc. He tried the sparking effects of the battery with metals and also with well-burnt charcoal. In the latter case the spark was larger and of a vivid whiteness and evident combustion was produced. Platinum in thin strips was introduced into the circuit and it was fused at the edges.

In volume 4 of the above-mentioned works is described an
698 experiment in which the circuit consisted of several materials. Two platinum wires from the extremity of the battery composed of plates a foot square were plunged into water and it was found that the quantity of gas disengaged from the wires was nearly the same as from an equal number of plates of an inch square. When the fingers of each hand were moistened with water and applied to the extremities of the battery a shock was felt about the same or nearly the same as if there had been no connection between the wires and the water. And while the circuit existed through the body and through the water a wire was attached to a thin slip of charcoal and made to connect the two poles of the battery with the result that the charcoal was vividly ignited. We clearly have in this experiment an incandescent light produced by the passage of a current through a thin pencil of charcoal. Davy also conducted experiments with a large battery made by Mr. Children, in the course of which he fused various metals by means of the current and when he employed points of charcoal an exceedingly vivid light was produced. He also conducted experiments with the great battery at the Royal Institution, having two thousand double plates, and very remarkable results were produced. When charcoal was employed for producing the arc, the pencils, which were one-sixth of an inch in diameter, became intensely ignited and on being withdrawn an arc was produced having a length of four inches. Davy defines exactly what he means by carbon. It signifies "the pure inflammable part of charcoal, lamp-black and other similar substances." "For the common purposes of experiment" he remarks that "the charcoal of light wood such as alder, that has been exposed to boiling water and afterwards ignited to whiteness is sufficiently pure." He evidently means by "ignited to whiteness" that the prepared wood is to be raised to a high temperature by a furnace or its equivalent in the process of carbonization, and not by the passage of a current. He further remarks that such charcoal must be employed immediately after ignition and while yet warm as it rapidly attracts
much moisture to itself from the atmosphere. Speak-
699 ing of the properties of carbon, he remarks that whether
it be coherent in charcoal or in the form of powder, it is infusible by any heat which has hitherto been applied. He states that he had exposed it to the intense ignition of various voltaic batteries and he found that whether *in vacuo* or in compressed gases on which it had no power of chemical action it remained infusible. Speaking further of the varieties of carbon he remarks that plumbago and anthracite are tolerably pure forms of this element, there being in plumbago about one twenty-fifth part iron

and in anthracite small quantities of earthy matter. He particularly mentions the anthracite of Kilkenny, in Ireland, of which "the texture is often fibrous," and states that "the substance has all the characters of well-burned charcoal." In volume 5 Collected Works, Davy records experiments with small pieces of charcoal from willow which had been intensely ignited and acted on by voltaic electricity in a Tor-cellian vacuum. The results secured were different from those when plumbago was employed. In this latter case after the first spark which would generally pass through about one-eighth of an inch there was no continuation of the light. But when the charcoal was employed a flame seemed to issue of a most brilliant purple and formed a conducting chain nearly an inch in length. Some permanent gas was given out during the experiment which he finally succeeded in collecting and investigating. In the same volume Davy records an experiment in which he employed charcoal which had been prepared with great care and through which he sent a current in which platinum instantly fused. The charcoal, while traversed by the current, was immersed in an atmosphere of nitrogen which Davy suspected might be a compound, and he evidently hoped by this experiment that he would be able to decompose the nitrogen at the high temperature produced. He records similar experiments with reference to other well-known compound bodies in which charcoal was ignited to whiteness by the electric current, saying that his view in making the experiment 700 with reference to oxymuriatic acid was to ascertain whether some new combination of carbonaceous matter with oxygen might not be formed. In the conduct of these experiments Davy took special pains to free the carbon employed from occluded gases and moisture by intense ignition in vacuum.

In Philosophical Transactions, 1839, volume 39, part I, is a letter addressed to Faraday by Daniell, in the course of which he recites various experiments and says that he combined a series of a battery of 70 cells for the purpose of observing chiefly the effects of light and heat produced by the current in a state of high intensity of constant action. With reference to one experiment he says: "The flame between charcoal points was of considerable volume, and formed a continuous arch when the points were separated to about three-quarters of an inch. This distance did not appear to be increased in the space exhausted by an air pump." He states that the light and radiant heat were very intense, and cites the effect upon the eyes, skin, &c., comparing them to the midsummer sun. Various metals in the form of wires were rendered incandescent by means of this battery.

In volume 32, "Philosophical Transactions," 1832, Ritchie says, in the course of some experiments on the magnetic phenomena produced by the current, that a piece of charcoal about one and a half inches long was placed between slips of copper fixed perpendicularly in order to ascertain the effect of an astatic needle suspended near the middle of the charcoal. Various experiments on the magnetic effects of the current are described in which charcoal is used as a conductor.

It appears from the state of the art, as already cited, that the various experimentors named, some of them having one purpose in view and others others, were endeavoring to ascertain to what the peculiar effects accompanying the passage of the current through various materials might be attributed, and also the effects of the currents upon the materials themselves or upon compounds which they might be capable of forming. It further appears that in the course of these experiments, compact, well-burned charcoal was fre-
701 quently employed both for producing an intense heat and light when points of such charcoal were separated from each other so as to form an arc, the electric arc, between them, and also when employed as a part of the continuous conductor for conveying the current, in which case it frequently became highly incandescent as it does in the modern practice of incandescent lighting. A definition of what is meant by charcoal is also clearly given, and some of the modes of its preparation in order to secure the best results with its use in connection with the electric current are pointed out; also the best sources from which it may be obtained, and boxwood, alder and willow are mentioned as suitable woods for the purpose. It is apparent that the charcoal employed and designated by the term was usually prepared by the incandescence of wood; in accordance with usage with reference to the word "charcoal," it means wood carbon, unless some qualifying adjective stands in connection therewith. It is quite apparent, for instance, that animal charcoal, or "bone-black," as it is usually called, is not included, as this latter substance contains, besides the pure, combustible carbon, other substances which would render it unfit for the purposes to which it was applied.

In the "American Journal of Science and Arts," volume 16, 1853, an account is given of a special method of carbonizing wood in which superheated steam is employed. Mr. Violette, a member of the commission on powder and saltpetre, gave his attention to the manufacture of charcoal by the method mentioned. The wood is immersed in vapor, and it is readily carbonized since in this manner it is easy to regulate the temperature of the vapor, and the charcoal obtained has a constant and uniform character. M. Violette made his communication to the academy, and in the course of it he showed that the change to charcoal takes place differently with different woods, and that the products of the same temperature differ in elementary constitution. "Charcoal made at 1500° centigrade conducts electricity better than the charcoal of gas retorts and serves perfectly for electric illumination." The
702 temperature which he names is fairly comparable with that which is used in the carbonization of material for the production of conductors for incandescent lamps. He observes that the higher the temperature at which the carbonization is effected, the more compact is the resulting material, and the better suited for electrical conductors. The major part of the communication is with reference to the operations in the manufacture of gunpowder.

In "Watts' Dictionary of Chemistry," volume 1, 1863, is an account of the preparation of charcoal from wood. It is particularly mentioned that wood charcoal is more or less compact according to the amount of wood from which it is formed, the light woods, such as willow, yielding a very porous charcoal having comparatively little power of conducting heat and electricity. Boxwood, on the contrary, yields a very much more compact charcoal which is a good conductor of heat and electricity and is admirably adapted for exhibiting a voltaic light. "The conducting power of charcoal is greatly increased by exposing it in close vessels to a very high temperature. Charcoal retains the form and to a considerable extent the extraordinary structure of the wood, so that a horizontal section exhibits distinctly the concentric rings and the traces of the medullary rays."

In "Comptes Rendus," volume 70, 1870, is an account of the preparation of charcoal when it is formed with the exclusion of air by the use of vapors or gases not containing oxygen and heated to a very high temperature. M. Sidot, who conducted his process according to this plan for this purpose inclosed wood in a porcelain tube in which, by the introduction of such vapors a suitable atmosphere could be formed. On gradually raising the temperature and carrying it to a very high degree and allowing the product to cool, charcoal having peculiar physical properties was produced. He observes that such charcoal is more solid, compact, and retains the form of the material from which it is made, and he states that he finds that the conducting power of such charcoal is very great and
703 that it might with advantage replace hard carbon from the gas retorts to be used in the voltaic battery. It does not perceptibly absorb moisture or gases. The pencils made from this carbon give an electric light far more intense than the light obtained with carbon from gas retorts. This carbon conductor heats up like metal and becomes progressively incandescent in the whole mass without igniting at one point like ordinary carbons. It may be characterized from a point of view of conductivity as wood charcoal transferred into coke. Wishing to obtain a sonorous instrument with this carbon Sidot states that he turned "a bell of ash and submitted it to the action of the carbon sulphide after the process just described, and that this piece of ash became a bell which gives a sound comparable to that of a metal bell of the same diameter." He speaks of carbonizing the most diverse wood, ash, box, hornbeam, lilac, elder and cork, and also says that he has obtained similar results from flax, hemp, cotton, paper and silk. It is to be observed that in the account of his experiments Sidot recognized more fully the hard and compact qualities of charcoal prepared according to his process than others had done before him who had employed a somewhat less efficient method of procedure, such as burying the material in powdered charcoal or in sand so as to thereby exclude the air during the process of ignition. It is to be further noticed that he clearly recognizes that the shape and structure of the carbonized material persists in the finished product so that it was possible to give any desired form to the material to be operated on before the carbonization and thus secure the resulting charcoal in the form in which it was to be employed for any special purpose.

In "Watts' Dictionary of Chemistry," London, 1875, second supplement, it is stated that several years ago Despretz found that all kinds of carbon heated in an electric arc of a battery 500 or 600 Bunsen cells soften and are ultimately converted into graphite. It is further stated that "when wood (of box, ash, hornbeam, alder, lilac or cork) or flax, hemp, cotton, paper or silk 704 is placed in a porcelain tube vapor of carbon sulphide passed over it at or during temperatures till all the air is driven out and then the tube slowly and gradually heated to redness for about an hour, the organic substance is found after cooling to be converted into a kind of coke having the ring of steel, silver, &c., and a great power of conducting heat and electricity. When heated it gradually becomes incandescent through its whole mass without taking fire at any particular part and cools down as soon as the source of heat is removed. It might, perhaps, be used to form the carbon cylinders of Bunsen's battery. It exhibits metallic lustre on its surface, is denser than wood charcoal, and does not sensibly absorb gases. A kind of carbon which is a good conductor of heat and electricity and does not absorb gases is likewise obtained by strongly heating wood in a crucible filled with charcoal powder."

It may obviously be remarked with reference to the charcoal prepared by the method just cited that it is no doubt of the same character as that employed by the early experimenters with the electric current, who prepared in general the charcoal which they used, by the ordinary well-known processes of calcination in close vessels, and who employed them for other purposes than were designed in the later preparation. The object of Davy and the early experimenters was primarily to observe the behavior of the electric current when passed through such conductors. The object of the later experimenters was more particularly to observe the characteristics of the carbon itself, and hence the accounts given more fully specify the character and properties of the charcoal so produced than do the accounts given by Davy and others of an earlier date.

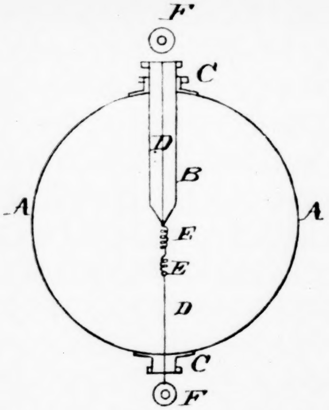
In English patent No. 8644, 1840, to Pinkus, it is stated "that its purpose is to illuminate reflectors or produce lights for lighting said railways or tunnels, or roads, or ways, or streets, or buildings, or mines," by means of electric force produced by motive power. Metallic circuits are employed, which lead from place to place. An electric light apparatus is suitably located. Electric light is 705 to be produced "by well-known methods or any combination of them, what is termed an electric glow or brush, * * * or which glows being produced by electric effects and known methods hermetically sealed in glass globes, in which may be placed air or gas or other substances, which may be rarified or compressed, or in which gases may be generated to increase the illuminating power of said glow or brush, or sparks or heated surfaces." We here have obviously what may be termed an electric lamp in which the light-producing substance to be acted on electrically is enclosed in a hermetically sealed glass globe.

English patent 9053, 1841, to De Moleyns. In this patent are set forth certain "improvements in the production or development of

electricity and the application of electricity for the obtainment of illumination and motion." The second part of the invention in the said patent "relates to the attainment of continued light by the adoption of a mode or arrangement which enables that light to be maintained and regulated and applied to any purpose for which light may be required." After stating that "the usual mode of exhibiting this electrical effect was by arming the electrodes of a powerful voltaic battery with charcoal points or one charcoal point and a fine platinum wire, which points were brought into contact either in the atmosphere or in an air-pump vacuum, and then removed slightly apart," it proceeds to describe the construction which is the feature of this part of the invention. It says: "A glass globe similar to that in present use for showing the electric light *in vacuo* is similarly furnished, with two brass caps in opposite parts of the sphere through which communication may be had with the interior, and by one of which the globe may be exhausted at pleasure." The lamp is provided with an incandescent coil of platinum, and a glass or other tube placed in on one side of the globe and approaching the platinum coil, "is now to be filled with finely pulverized boxwood charcoal or plumbago, and on connection being established between the electrodes of the battery one of the fine platinum coils become white hot
706 & 707 the charcoal which falls through and around both coils
is ignited, and a light pure and intense is thus obtained, which is kept up by the continual changing points of contact of the coils with the charcoal powder, as by its gravity it descends slowly through the tube and falls to the bottom of the sphere, thence to be withdrawn for future use." In this patent we have set forth clearly a glass globe, which can be exhausted at pleasure, through which conductors are introduced which can be brought to a state of incandescence by the passage of an electric current and carbon in the form of boxwood charcoal or plumbago is used in connection with the ignition for the purpose of increasing the light, the carbon being in the form of powder, which is constantly supplied so that as the several particles perform their function, their place is taken immediately by others, the carbon not being consumed, but in performing its function being in a state fit for repeated use for the same purpose.

The figure illustrative of the lamp in the patents is as follows:

E. P. No. 9053 of 1841 of De Moleyn's.



708 The patent states with regard to this drawing that "A A represents the glass globe; B the glass or metal tube with conical end holding pulverized charcoal; C C brass caps through which the electrodes and glass tube pass through air-tight collars; D D copper electrodes to which the terminal platinum coils are attached; E E the thin plantinum wires coiled; F F binding screws to connect electrodes with battery."

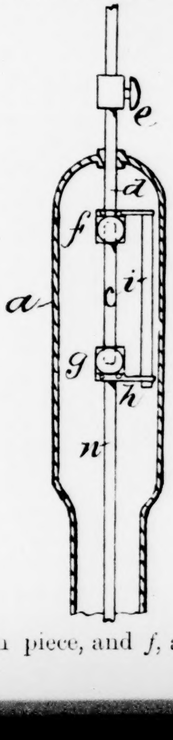
English patent No. 10919, 1845, to King, relates to electric lights, and first describes the conditions to be observed in the construction of an incandescent electric lamp with a conductor of platinum. In figure 2 of the patent a lamp is shown intended to employ carbon as the incandescent conductor. A Torricellian vacuum is produced within which the incandescent carbon is to be placed and the electric current is transmitted through it by means of a platinum wire which is sealed into the top of the glass bulb while a copper wire hangs from the lower end of the carbon into the mercury, while the clamps or forceps shown in the accompanying figure which hold the carbon are connected together by a porcelain rod. That form of carbon which is employed is that which is formed on the interior of coal-gas retorts, which has long been used and is well suited to this purpose, and can be worked into the form of either small pencils or thin plates by the aid of the saw and file. The patent remarks that as carbon " will bear a very high temperature without fusion or volatilization, it may be employed when a very intense light is required."

When platinum is used the lamp is not exhausted but the patent says, " when carbon is used it becomes necessary on account of the affinity of its substance for oxygen at high temperature, to exclude it from air and moisture. To accomplish this in the most perfect manner it should be enclosed in a Torricellian vacuum." And it subsequently shows that " when the apparatus is suitably sealed it

may be applied to submarine lighting and also to the illumination
of places where it is necessary to guard against the inflamma-
709 tion of highly combustible or explosive compounds as in
powder magazines, mines, &c."

References to this patent of King and to the experiments of Starr, the inventor, may be found in the literature on the subject. Thus the "Mechanics' Magazine," London, 1846, volume 44, contains a full copy of the specification of the Scotch patent of this invention, and a note by the editor subjoining paragraphs from his commonplace book "which may suffice to show not only the want of novelty in Mr. King's imported invention, but the point at which the labors of men of science in this department have arrived." These paragraphs describe a light for mines by M. de la Rive under the date of November 8, 1845, which appears to be an arc light employing cylinders of coke enclosed in a glass globe hermetically sealed, and the experiments of Professor Groves under date of December 7th, 1845, on incandescent platina in a closed vessel and also on carbon points. This article was replied to by a letter under date of May 21, 1846, signed William Williams, claiming that Starr, the inventor, was the first to produce an incandescent lamp. The following is a copy on a reduced scale, of figure 2 of King's patent showing the Torricellian vacuum lamp, described in the patent as employing an incandescent conductor of carbon:

710 *E. P. No. 10919 of 1845 of King's.*

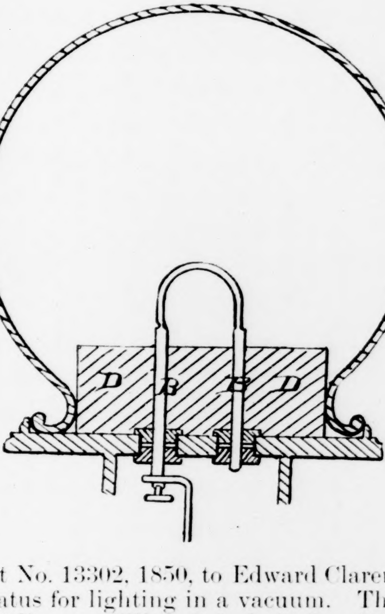


c represents the carbon piece, and *f*, and *g*, the forceps which hold it.

English patent 11076, 1846, Greener and Staite, is for "certain improvements in ignition and illumination." The invention is first stated to consist generally in the illumination of buildings, etc., "by means of solid prisms or cylinders of carbon enclosed in air-tight vessels of glass or some other transparent substance and ignited or rendered luminous by currents of voltaic or magnetic electricity." Continuing, it says: "Both carbon and platinum have been before employed as media for the development and exhibition of electric light, but carbon, even in the purest states in which it
711 has hitherto been available, when ignited or rendered luminous in an air-tight glass vessel by means of electric currents has been found to give out various extraneous matters which interfere with the continuity of the light, or which being precipitated on the inside of the glass vessel obscure and darken the same. * * * Now to obtain for the purpose of our invention a carbon absolutely pure, or at least more nearly approaching absolute purity than any heretofore known, we proceed as follows: We take a quantity of what is known in commerce under the denomination of lamp-black, or of charcoal reduced to a state of powder, or of coke also reduced to powder, which has been purified by the application of electricity from sulphur or other metallic mixtures, * * * and digest the same in dilute nitro-muriatic or other acid; we then strain the lamp-black, or charcoal, or coke from the acid and wash it several times with water, and we next wash it in some weak alkaline solution or carbonated alkaline solution and finally we wash it with distilled water until no traces of impurity are perceptible." Thus purified, the carbon is dried and then converted into solid prisms or cylinders, both solid and hollow, by means of a hydraulic or screw or fly press. "And sometimes the better to insure perfect dryness and homogen-ousness we expose the prisms or cylinders to intense heat in a furnace for about twenty-four hours." The prisms or cylinders are provided with acuminated surfaces, or they may have plain surfaces. When a hollow cylinder of this compressed carbon is used it may be placed in circuit by means of two hollow cones of platinum between which the carbon cylinder is placed and which are connected with the circuit wire." "We think it unnecessary to describe either how the air-tight vessel which is to enclose the illuminated body should be mounted or how the electric currents are to be conveyed to and from the voltaic battery or the magnetic machine employed, because there are many well-known modes of doing so, and we do not claim to have invented anything in that respect. We desire it farther to be understood that we
712 lay no claim to the employment of carbon, platinum or other and like difficult*ly* fusible metal enclosed within air-tight vessels as a medium for the development and exhibition of electric light, the suitableness of both bodies for that purpose when so enclosed (subject to the difficulties aforesaid) being long well known." This patent evidently describes an incandescent electric lamp having for a conductor a compressed body of powdered carbon, which the patent says may be charcoal, and which is enclosed in a suitable air-tight vessel.

English patent No. 12212, 1848. This is Staite's patent, covering the incandescent lamp with iridium arch-shaped form of conductor. The conductor is an arch-shaped piece of irridium secured to platinum wires. The lamp is shown as mounted on a bracket, one part of the circuit going through the bracket and the other through a wire passed through an arm of the same. A circular controller or key is provided for making and breaking the circuit, and in one form the metal holders or leading conductors are passed through a block of glass or other similar bad conductor of heat, "so that the heat and radiant light may be developed with as little loss of the former as possible by radiation." This block of glass seems to fill the neck of the globe and makes the entire interior of the lamp chamber of glass. The following is a copy of figure 25 of the patent on a reduced scale, D D being a block of glass, B B the platinum conductors leading to the arch of iridium which forms the incandescent conductor of the lamp:

713 *E. P. No. 12212 of 1848, of Staite's.*

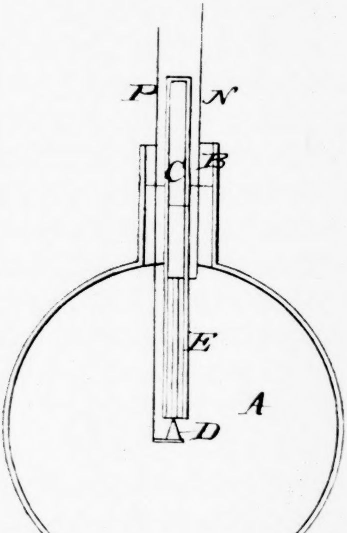


English patent No. 13302, 1850, to Edward Clarence Shepard, describes an apparatus for lighting in a vacuum. The description is substantially as follows: "When it is desired to light by means of the incandescence of charcoal, I employ an arrangement of apparatus similar to that represented in figure 10. A is a glass globe which may, if desired, be ground or obscured on the inside in order to disperse and soften the intensity of the light. The stopper B of this globe is very carefully luted, and two insulated polar wires, P and N, of about two millimeters in diameter are passed through it.

One of these wires is soldered to the side and towards the upper end of a copper tube, C, of about one decimeter (four inches) in leng th. This tube is intended to hold a little cylinder of charcoal which 714 is kept constantly pushed down from above by a small cylinder of lead, which is of a weight adjusted to the purpose. The other polar wire comes out under the lower end of this tube at about one centimeter (three-eighths of an inch) distance from its extremity and terminates in a little cone, D, of prepared charcoal or coke, and against the top of which the little charcoal cylinder E rests, which, when the current is established, becomes incandescent and remains in that state a very long time, because the small portions which are consumed are continually replaced by a portion of the cylinder which the metal presser forces onto the top of the cone. A tube of glass or other suitable substance also passes through the stopper and admits of its being connected to the pneumatic receiver in order to create a vacuum in the globe. The tube is afterwards cut and hermetically sealed in order to prevent the re-entry of air."

The following is a reduced copy of figure 10 of the patent, which shows the apparatus for lighting in a vacuum described in the patent by means of the incandescence of prepared charcoal:

715 *E. P. No. 13302 of 1850 of Shepard's.*



Adjourned to 6.45 p. m.

New York, *March 8th*, 1889—6.45 p. m.

Present: Mr. Dyer, Mr. Griffin, Mr. Kerr.

Direct examination of Prof. Brackett resumed:

In this patent of Shepard we clearly have described a lamp for incandescent lighting by means of electricity, which consists of a globe in which a vacuum can be produced and with provision for detaching from the pneumatic apparatus and hermetically sealing. 716 In the interior of this globe is found a cylinder and a cone of prepared charcoal, together with a device by which they are kept continuously in contact so that at the point of contact which offers a greater resistance incandescence is maintained while there is but little wasting of the materials employed.

English patent No. 212 of 1852 to Slater & Watson, entitled Improvements in the application of electricity to illuminating purposes.

This patent describes the making of electrodes for the arc electric light by mixing beechwood charcoal with other materials and carbonizing a mass of the same in a mould, the electrodes being afterwards cut from the mass of carbon. The patent then proceeds to describe the method of making these arc-light electrodes as follows:

"We have found that good electrodes giving a steady achromatic light may be prepared by the following process, from well-burnt beech charcoal, selected from the small wood, or, as they are technically termed, 'loppings;' boxwood will do as well. A piece of the charcoal sawn into required size for the electrodes is steeped in a solution of caustic lime for about a quarter of an hour; it is then taken out, dried and placed into a crucible containing powdered charcoal, and a lid being firmly and closely luted onto the crucible, it is exposed to a white heat for about half an hour; it is then taken out after the crucible is cooled, placed into a saturated solution of alum, and after having soaked for about half an hour it is dried, and again brought to a white heat as before. It is again removed and plunged whilst hot into treacle or any thick saccharine or carbonaceous fluid and finally once more ignited. If the operations have been properly conducted it is now very hard, quite free from any traces of lign*i*ous structure, a perfect conductor and burns moderately slowly, equally and noiselessly when forming the terminal of the voltaic arc."

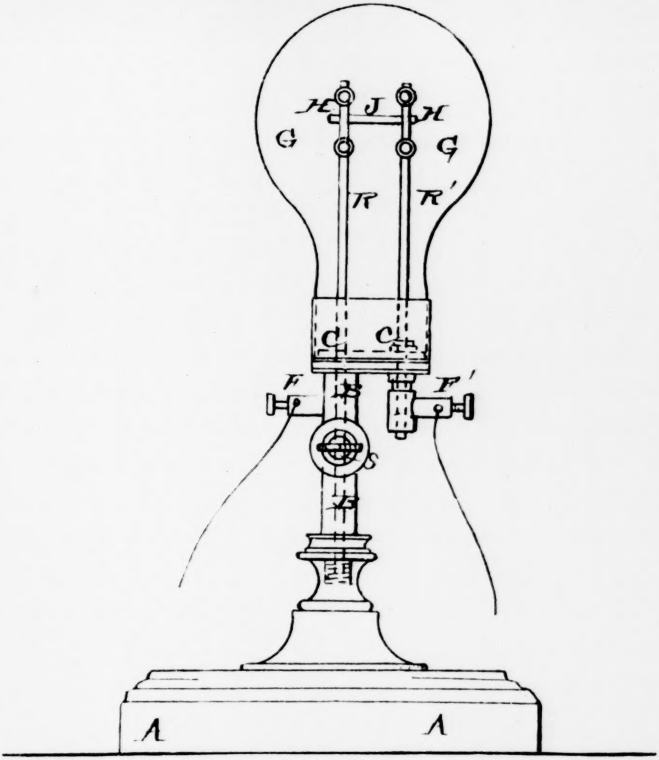
717 English patent, No. 14198, 1852, to Martin John Roberts, after setting forth various other matters, the patentee remarks, "Another part of my invention consists of a mode of obtaining electric light by passing a current of electricity through a thin piece of graphite, coke or charcoal or other infusible body being a conductor of electricity, while it is enclosed in a vacuum or space not containing any oxygen or other matter which might cause the combustion or destruction of it when brought into an incandescent state by the action of a current of electricity." This part of the invention is shown in figure 5 of the drawing of the patent, respecting

which the patentee remarks, "I have shown an elevation or side view of an apparatus which may be used for this purpose, but I desire it to be understood that I do not claim any of the elements or parts of which this apparatus is composed apart from the combination thereof. In this figure A is a stand upon which the hollow pillar or tube B can be screwed; this tube is furnished with a stop-cock S by which its passage can be closed air-tight. On top of the pillar is a screw C about one and a half inches in diameter, which receives the neck of the globe G also furnished with a cap and screw to allow it to be screwed air-tight down upon the tube B. The tube B has a binding screw F soldered to it for the purpose of making connection with a galvanic battery and the tube is also in metallic connection with the rod R, having at the end of it a clip H for the purpose of holding the piece of graphite or other substance through which I wish to pass the electricity. Another rod R′ also furnished with a similar clip H′ passes through the head of the pillar or tube B, but is preserved from coming into metallic contact with it by having the rod enveloped with ivory at D or other non-conductor of electricity. At the bottom of the rod R′ is another binding screw F′ for the purpose of connecting it with the other pole of the battery. Now, the mode of operation with this apparatus is as follows: A piece of very thin graphite about one-half an inch long, one-half an inch wide and as thin as conveniently can be made is fastened at each end into the clips H and H′ and firmly secured. The globe G is screwed air-tight upon the pillar D, the stop-cock S is opened, 718 and the whole apparatus by a screw at the bottom B screwed down upon an air pump or air-exhausting syringe; by this the air is drawn out of G and as perfect a vacuum as can conveniently be made, obtained. When this is done the stop-cock is shut and the apparatus is then removed from the pump to its stand A and a galvanic battery is put in connection with it by the binding screws F F′, the electricity passes through the rods, and a thin piece of graphite J, which becomes white hot from the passage of the electric current, and no combustion will ensue if the vacuum be perfect and no matter within the globe to cause combustion of the graphite; or if the graphite be not otherwise destroyed the light continues as long as the electricity flows through the graphite with sufficient strength.

And in respect to this part of my invention I claim the production of light by passing electricity through a thin infusible body being a conductor of electricity in the manner hereinbefore described.

The following is a copy of figure 5 of the patent which is referred to in the following description:

719 *E. P. No. 14198 of 1852 of Roberts.*



In this apparatus for producing the electric light by means of
incandescence we have a globe of glass furnished with suitable fittings
for connection with a means of exhausting, and also fittings
suitable to connect it with the wires leading from the voltaic battery.
In conducting connection with the latter fittings are provided
within the globe means of conveying the current to be employed
through a thin slip of graphite or other substance through
which it is desired to pass the electrical current. And the
720 patentee especially mentions coke, charcoal or other infusible
body being a conductor of electricity. The patentee has thus
secured, so far as the state of the art rendered it convenient to do so,
the advantage to be obtained by highly heating carbon, which is
infusible, without contact with it of oxygen, which would tend to
destroy it by combustion.

In Bink's English patent, No. 119, 1853, the patentee remarks that his "invention relates to the forms, arrangements and modes

of working the electrodes and to the materials of which to construct the electrodes for producing light by electricity." In alluding to the state of the art he remarks, "In the ordinary arrangements of the carbon electrodes for producing light by a current of voltaic electricity two rods or pencils of solid charcoal are used." He describes as one feature of his invention the use of a number of rods of charcoal so as to produce several arcs in the same lamp at the same time. Respecting another point of the invention he says, "The second part of my invention consists in using for the carbon electrodes the charcoal obtained by subjecting lignite to destructive distillation in closed vessels, that is, I fully carbonize lignite and employ the hard, close-grained charcoal thus obtained as the light-giving electrodes for which it is admirably adapted and has not hitherto been used." With respect to another feature of the invention he says: "I affix thin slips or cuttings of charcoal or charcoal veneer by some adhesive material to the surface of slips, bars, plates or other forms of metal to act as the conductor and to obtain improved forms and kinds of electrodes for the production of electric lights." It appears that the patentee proposes to use carbon in the form of rods for the purpose of maintaining the electric lights in the arc form as well as the use of carbon in the form of thin plates or veneers for incandescent lighting. It will also be remarked that the particular form of carbon that he proposes to use is charcoal, and he mentions as a special substance from which it may be prepared, lignite. Lignite is partially reduced wood or other
721 vegetable matter in its progress from its condition in the organic state toward coal. And what he proposes to accomplish is simply the completion of the process which is frequently effected naturally and thus to procure a form of vegetable fibrous carbon which is comparable with that already alluded to in this statement of the art as used by Sir Humphrey Davy.

English patent No. 2547, 1856, to Way, sets forth improvements in obtaining light by electricity. He clearly recognizes that "heretofore in obtaining light by means of electricity electrodes of charcoal have usually been employed."

English patent No. 588, 1857, to Charles Weightman Harrison for the invention of improvements for obtaining light by electricity. It describes the construction of carbon pencils from wood charcoal. It says: "I form pencils or solid-carbon electrodes by suspending small rods or pencils of wood charcoal upon a frame of iron which I place within a heated gas chamber or retort, where it will be subjected to a high degree of heat. By this process the charcoal is rendered hard and lasting."

English patent No. 2841 of 1857 to Way, for obtaining light by electricity, describes an electric lamp in which two rods or pencils of charcoal are pressed together by springs. An electric current passes through the charcoal pencils, producing incandescence at their ends where the greatest resistance is offered to the current. A jet of mercury is caused to fall upon the incandescent portion of the charcoal pencils.

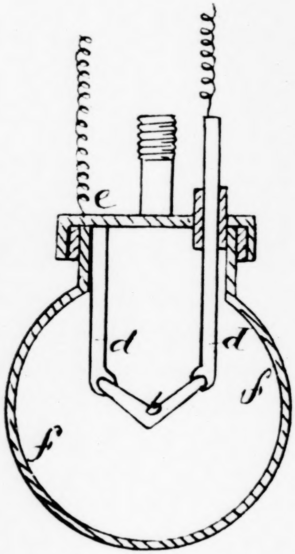
English patent No. 3164 of 1857 to Burleigh and Danchell, describes the manufacture of various articles of carbon, among them being "electrodes for electro or galvanic purposes" and "charcoal pencils." The patent describes the taking of various carbonaceous matter, including "vegetable charcoal," either by itself or mixed with and rendered plastic by a suitable carbonizable cementing medium. The material is given the form of the completed articles by moulds, "after which the objects are baked or burned in closed vessels."

722 English patent No. 3809, 1872, to Konn, described an arch or V-shaped conductor enclosed in a glass globe filled with nitrogen. In the specification the author remarks: "One or more conductors which are preferably graphite, are enclosed in a species of lantern, hermetically closed and filled with nitrogen or other gas that does not support combustion, and are maintained therein by any convenient method of support. To produce the electric current an ordinary magneto-electric machine, such as those of Wild, Noble and others is employed, and the current is led into the lantern by means of a wire to one of the graphite conductors (when the lantern contains more than one), and in passing through the conductor the electricity heats it to redness and causes it to give out a brilliant light. The current is then led to the second graphite conductor, and passing through that, producing a similar effect, is led to a third, and so on till all the conductors in a particular lamp have been illuminated, when the current is led to those in the next lamp and so on to the end of the series." In the drawings accompanying said specification are shown the modes of construction in some of which the carbon to be rendered incandescent is in the form of straight bars or rods suitably confined in conducting supports which are connected with the means of producing the electric current, the whole being enclosed. One form is shown and described in which is used a "carbon stem which is V-shaped, the electric current passing down one side and up the other side of the V, the light being formed at the angle at the bottom. This stem is suitably supported and enclosed in a glass lamp or case filled with nitrogen or gas incapable of supporting combustion as before, and the current of electricity is applied as in the first instance, or in any convenient manner." The patentee also remarks, with reference to the conductor to be rendered incandescent, "the stem is composed of graphite or a composition of the usual description, compressed or formed with a reduced diameter at or near its central part, as at B, the ends C, C, being of larger diameter and clipped or held in socket frames, D, D, which pass through the lantern
723 ends, E, E, and are connected to the circuit wires from the magnets or from the battery. Any number of the carbon stems can be employed in the same manner, and the current of electricity made to pass from one stem to the other until the whole or any two or more are charged for lighting as desired. The lanterns are composed of the two ends, E, E, the lips of which receive the glass, F, of the required shape, and in such a manner that the whole can be hermetically closed for preventing electrical contact with the atmosphere which is essential for the purpose of practically

carrying the invention into effect, and in order to fulfill its object more completely the lanterns are charged with nitrogen or other gas, which does not support combustion." Reference to this specification and the accompanying drawings, makes it clear that in Konn's improvements he contemplates the use of carbon in the form of rods, also in an arch or V-shaped form, enclosed in suitable glass vessels which are to be filled with gas incapable of consuming the conductors when raised to a high temperature. He lays special stress on the fact that in order to carry out his invention successfully it is necessary that these chambers be hermetically closed so as to avoid contact of the highly heated materials with the air. He obviously recognizes the power of carbon when raised to a very high temperature as would be necessary in incandescent lighting to combine with oxygen if it were permitted to do so, and has taken care to provide means to avoid this effect and so to secure permanence in the operation of his apparatus.

The following is a copy of figure 8 of the Konn patent, showing the lamp having the V-shaped carbon stem:

724 *E. P. No. 3809 of 1872 of Konn's.*



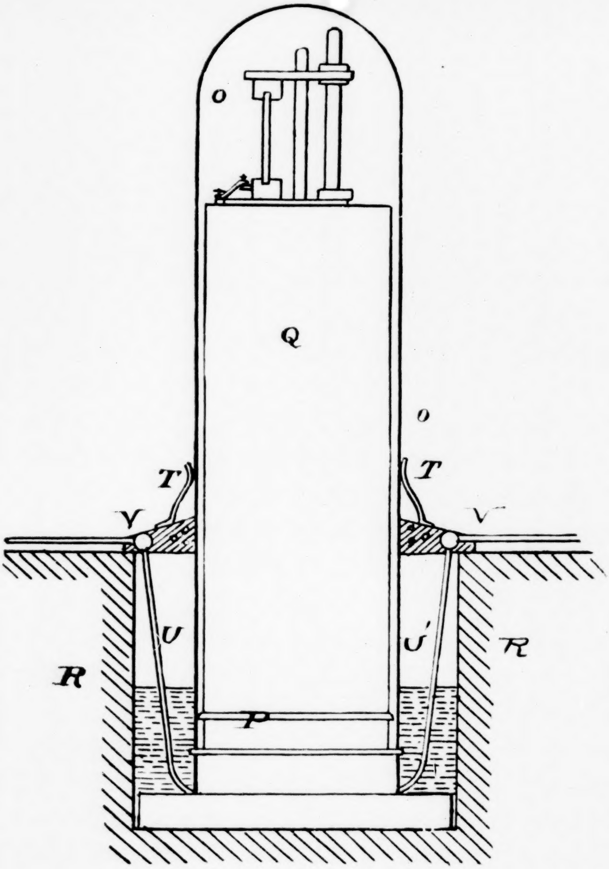
English patent No. 91, 1873, to Konn, describes an apparatus similar to that in Konn's patent already referred to except that the apparatus is used for heating and the globe instead of being of glass is of metal. In other respects the apparatus is similar to that just referred to. In this patent of 1873, it is stated with regard to the V-shaped carbon burners: "It is evident that stems of other shapes

may be used." It may be remarked with reference to this patent that while its general similarity of form and construction is apparent, the material used for the incandescent part of the apparatus which is to be hermetically sealed within closed vessels charged with azote (nitrogen) or other gas, is described as being solid rods of carbon, the patentee evidently not restricting himself as to the particular variety of carbon used. The V shape of the
725 stem, as he calls the incandescent portion, is clearly shown
in the accompanying drawings and referred to in the specification.

English patent No. 441, 1875, to Kosloff, entitled "Improvements in the production of electric light and in apparatus therefor" corresponds with United States patent 166,877, August 17th, 1875. It describes a very complete lamp construction having a globe sealed in liquid at the bottom and containing carbons in its upper end, the whole of the lower portion of the globe being filled with a block of porcelain or glass, which prevents the conduction of heat to the sealing and through which the conductors leading to the carbons run. The construction of this lamp is quite similar to Sawyer and Man's in respect to locating the carbons at the upper end of the globe and the cutting off the conduction of heat to the sealing. The globe is also closed by glass instead of by a metal plate.

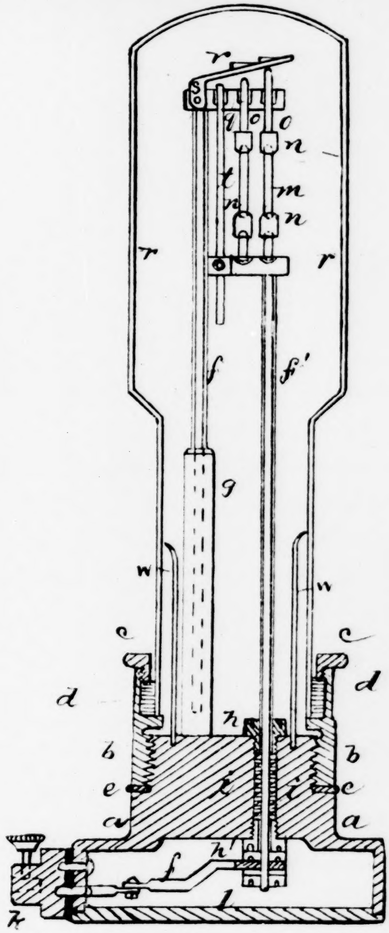
The following is a reduced copy of figure 4 of the drawing of the patent referred to which shows the general arrangement of the lamp structure:

726 *E. P. No. 441 of 1875 of Kosloff's.*



English patent No. 970, 1875, also to Konn, shows a later construction than that of Konn's patent 3809, of 1872, with very complete arrangements for sealing the lamp. A number of carbons are located in the upper part of the globe with a shutter
727 circuit closer for closing the circuit to the carbons in succession. It is a form of lamp well known and illustrated in many books relating to the subject of electric lighting. A very complete and elaborate description of the lamp is found in the patent fully illustrated by the accompanying drawing. The following is a reduced copy of figure 2 of the drawing of the patent:

728 *E. P. No. 970 of 1875 of Jenson's.*



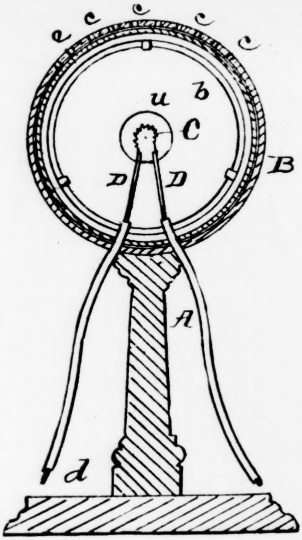
English patents Nos. 4805, of 1876, and 4905 of 1876, show arc lights with curved carbons.

729 March 9th, 1889—11 a. m.

Present: Mr. Curtis, Mr. Dyer, Mr. Griffin.

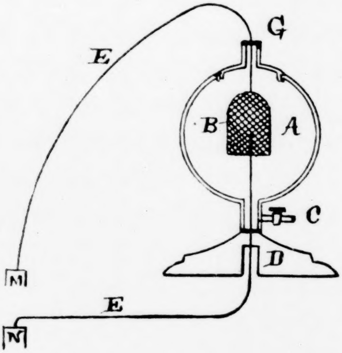
United States patent of Gardiner and Blossom No. 20706, June 29, 1858, electric signal light, shows a signal light having an incandescent platinum in an arch form enclosed in a protecting globe, which, however, appears to be open to the air. The following is a copy of figure 3 of the drawing of Gardiner and Blossom's patent:

U. S. Patent to Gardiner and Blossom, No. 20706, Dated June 29, 1858.



United States patent of Woodward No. 181,613, granted August 29, 1876, for electric light, shows a lamp having an incandescent carbon enclosed in a hermetically-sealed glass globe from which air is exhausted and in which a rarefied gas that will not unite chemically with the carbon when hot is placed, the lamp chamber 730 being hermetically sealed. The following is a copy of figure 3 of the drawing of the patent:

U. S. Patent to Woodward, No. 181,613, Dated Aug. 29, 1876.



A is the glass globe, B is the carbon, C is the air-tight stop-cock to be used in exhausting the air from the globe A, and for the injection of the rarified air into the globe of the same. E, E, are conducting wires. The vessel is hermetically sealed at the ends G, G, of the tubes, and D is a stand upon which the lamp is placed.

United States patent to Kosloff, No. 160,877, dated August 17, 1885. Electric light. This describes the same lamp as is described in English patent 441 of 1876, as before stated.

Ladyguine's light.

A description and exhibition of Ladyguine's light at St. Petersburg is contained in several of the publications which republish an article from the Russian paper called the "Golos," No. 129, of May 11–23, of 1873. An example of one of these republished articles is contained in the Journal of the Society of Arts, London, 1872–'3, volume 21, August 22, 1873, page 179.

It describes a public exhibition of Ladyguine's light in St. Petersburgh in the presence of more than one hundred specialists from different countries, "representatives of science, honorable 731 visitors and many reporters who were all deeply interested and unanimously decided that the trial was really successful." The article says, referring to Ladyguine's light: "By his newly invented method only one piece of charcoal or other bad conductor is required, which being attached to a wire connected with an electro-magnetic machine is placed in a glass tube from which the air is exhausted and replaced by a gas which will not at a high temperature combine chemically with the charcoal. This tube is then hermetically sealed and the machine being set in motion by means of a small steam engine the charcoal becomes gradually and equally heated and emits a soft, steady and continuous light which by a most simple contrivance can be strengthened or weakened at the option of those employing it, its duration being dependent solely on the electric current which of course will last as long as the machine is kept in motion." This evidently describes an incandescent lamp and in a hermetically sealed glass chamber in which is contained a single piece of incandescent charcoal suitably connected with conducting wires leading from a source of electricity and from which the air is exhausted, the globe being subsequently filled with a gas which will not chemically combine with the charcoal. Being hermetically sealed it becomes independent of the exhausting apparatus and so a portable lamp.

In regard to the state of common knowledge respecting pneumatic apparatus prior to the date named in the question, it may be stated that early in the history of the modern air pump it was a common practice to connect the exhausting cylinder by means of a suitable tube with a ground plate upon which the vessel to be exhausted was placed. By ground plate I mean a plate made truly flat and free from irregularities as nearly as may be. The edge of the glass receiver generally employed was and still is in modern practice ground so as to fit accurately upon the plate just mentioned. The material of such plate has commonly been either glass or metal. When the apparatus is destined to be used in connection with chemical operations in which corrosive gases are frequently involved,

glass is usually employed. When such use is not contem-
732 plated, metal may be employed and frequently is, and not
infrequently the same air pump is furnished with a series of plates several in number, some of which are made of metal, others of glass, in order that the single pump may be adapted to the various uses to which it may be destined. The several plates are furnished with screws of uniform pitch so as to be adjusted to the tube connected with the exhausting cylinder and can replace each other as occasion may demand. When it is required within a receiver in the course of any experiment to maintain for a longer time than would be convenient in connection with the pump when the exhaustion of the receiver has been complete it, together with the plate on which it rests, is detached from the pump by unscrewing the plate, and thus the pump is liberated for subsequent use. When even very accurate grinding of the plate and fitting of the receiver thereto has been secured a high vacuum cannot be maintained continuously for a great length of time, and it is the common practice in the use of such apparatus to adjust the receiver upon the plate by means of some soft plastic material, not infrequently tallow or tallow mixed with wax and oil or some form of pomatum. In pneumatics it is not infrequently required to fit two pieces of apparatus together so as to maintain the union gas tight when the apparatus to be joined does not necessarily contain a vacuum. But when it is employed to hold gases under varying pressure sometimes very high, and when it would be inconvenient on account of the manipulations involved to employ the usual method of making joints tight by means of screws with washers; in such cases clamps are well known and have been for a long time. Such clamping devices may, it is well known, be constructed so that the movable parts are held together by means of screws, wedges or cams, and the bayonet device is not infrequently employed.

5 Q. Please examine the patent in suit and state what features of novelty, if any, you find in the apparatus therein described and illustrated.

A. The patent in suit says that "our invention, speaking
733 generally, relates to that class of electric lamps employing an
incandescent conductor inclosed in a transparent, hermetically sealed vessel or chamber from which oxygen is excluded," that is, it relates to the class of electric lamps described by most of the patents and publications referred to in my last answer, and notably the lamps of Pinkus, De Moleyn, King, Greener and Staite, Shepard, Roberts, Konn, '72 and '75, Kosloff, Woodward and Ladyguine. The patent in suit says that the invention "constitutes an improvement upon the apparatus shown in letters patent No. 205,144, granted to us June 18, 1878." This prior patent to the same inventors is said by the patent in suit to show the construction of the lamp chamber, while another early patent to the same inventors (No. 210,809, dated December 10, 1878) is said to show the electric connections which are made in the base of the lamp. The construction of lamp chamber, its sealing, the atmosphere contained within it, the manner of conducting the electric

current to the inclosed incandescent conductor, and in fact all the features of the lamp, except the material and form of the incandescent conductor itself, are stated by the patent in suit to be shown and described in the two early patents to the same inventors. These features, however, are much older even than the early patents to the same inventors which are referred to in the specification of the patent in suit, since substantially the same lamp construction is proposed by all the patents and publications relating to incandescent electric lamps prior to the year 1878, which have already been referred to by me. It is also merely a reproduction of the ordinary air-pump construction in which the early experiments of Davy and others were tried when a vacuum or confined gas was employed.

One feature of the construction of the lamp chamber seems to be considered of importance by the patent in suit, namely, the employment of a glass plate or stopper for closing the open lower end of the lamp chamber. The tubular conductors which support the conductors within the lamp and complete the electric circuit connections therewith pass through holes formed in this glass 734 plate, and the patent states that this lamp chamber construction makes the wall forming the chamber of the lamp "wholly of glass, by which all danger of oxidation, leakage or short-circuiting is avoided."

The glass plate is ground to the flange on the bottom of the chamber "to form an air-tight joint" and the plate is clamped to the flange on the chamber. Of course, as generally known from experience with pneumatic apparatus, such a joint is not "air tight," but may be somewhat improved in its character by the use of a plastic material. We find in the patentee's earlier patent No. 205,144, which gives a more complete description of the lamp chamber that the ground edges are coated "with fir balsam or some cement in order to better insure that hermetical sealing which is indispensable to the preservation of the incandescent conductor."

The use of a glass plate instead of a metal plate for closing the open end of the chamber is very old in air-pump receivers, and the glass plate is only a well-known substitute and equivalent for a metal plate for the same purpose. The plates which close the open ends of the lamp chamber in Roberts' patent (Eng. pat. No. 14198 of 1852) and in Konn's patents (Eng. pat. 3809 of 1872 and 970 of 1875) is probably in each instance a metal plate, but I consider it the full equivalent of the glass plate of the lamp chamber of the patent in suit. It is not the transparent character of the plate which is taken advantage of, since, in the patent in suit, the plate is covered by a metal cap, and, in addition, the light rays in that direction are cut off by a solid diaphragm which fills the lamp chamber just below the burner. This diaphragm is described in patent No. 205,144 as "a disk of soapstone, porcelain or other refractory substance." So far as leakage is concerned the glass plate would have no advantage over the metal plate. The "danger of oxidation" would be greater with the glass plate than with the metal plate, since the only oxidation that is injurious is that of the carbon conductor which in the presence of oxygen is consumed. If any

traces of oxygen are left in the lamp chamber or gain access to it they will attack the carbon and destroy it. Should the oxy-
735 gen be taken up by the oxidation of the metal plate the
danger would be avoided. The remaining advantage, that of avoiding short-circuiting, is merely fanciful, since there is not the least trouble in such a lamp construction as that described in the patent in suit in securing the proper insulation of one of the conductors from the metal plate as is done by Roberts and Konn, and if the cement which seals the tubes into the glass plate of the lamp of the patent in suit is effective as a sealing it will also be effective as an insulator.

However, even outside of the air-pump receivers, which have glass bottom plates and from which the lamp chamber of the patent in suit is taken, the closing of the open end of the globe by a glass plate is old in incandescent electric lamps.

Kosloff (Eng. pat. 441 of 1875 and U. S. patent 166,877, dated Aug. 17, 1875) uses a base of porcelain or glass, upon which the chamber rests. He also fills the lower part of the lamp chamber with a block of the same material, this latter feature being significantly similar to the use of a porcelain disk by the patentees of the patent in suit, since it is obvious that the space between the porcelain disk of the lamp chamber of the patent in suit and the bottom plate is not utilized, and the porcelain disk might with the same effect be extended in the form of a block and stand on the bottom plate as it is in Kosloff's lamp. Kosloff's lamp is sealed by a liquid, and so also may be the lamp of the patent in suit, since it is stated in the patentee's earlier patent No. 210,809, which is referred to in the patent in suit for a fuller description of the sealing, that instead of using beeswax as a sealing agent "even an oil or other liquid will answer the purpose equally well." Kosloff uses olive oil. The glass plate for closing the lower open end of the globe is also used by Staite (Eng. pat. 12212 of 1848), so that in the lamps of both Kosloff and Straite we have the wall of the lamp chamber "wholly of glass" in the same sense that it is in the lamp chamber of the patent in suit, and the patent in suit is also antici-
736 pated in this respect, as has already been stated by the two
1878 patents of the same patentees.

The entire lamp construction thus being admitted to be old by the patent in suit itself as being in the earlier patents to the same patentees, and being shown to be old in still earlier patents, there only remains to be considered the incandescing conductor. The patent in suit says: "Our invention relates more especially to the incandescing conductor, its substance, its form and its combination with the other elements composing the lamp. Its object is to secure a cheap and effective apparatus, and our improvement consists, first, of the combination in a lamp chamber composed wholly of glass, as described in patent No. 205,144, of an incandescing conductor of carbon made from a vegetable fibrous material, in contradistinction to a similar conductor from mineral or gas carbon, and also in the form of such conductor so made from such vegetable carbon, and combined in the lighting circuit within the exhausted chamber of the lamp."

The patentees say that they "have made use of carbonized paper and also wood carbon." The shape or form described and shown for the incandescent conductor is an arch shape, although a V-shape burner and burners with rectangular bends insteads of curvilinear ones are described as the equivalent in shape. No method of preparing the material for carbonization or for carbonizing it *as* described. These are to be done "substantially according to the methods in practice before the date of this improvement."

The material, then, is a carbon from vegetable fibrous material of which paper and wood are illustrations, and the form is an arch or a V shape, or a form like an arch but with rectangular bends instead of curvilinear ones.

Now, first as to the material; carbon from fibrous vegetable material—that is, wood carbon or charcoal, was the first material used for producing the electric light, both by means of the arc and by incandescence. It is described as so used in the papers read by
Davy and others early in the present century. When later
737 the properties of vegetable fibrous carbon, not only from
wood but also from paper, cotton, hemp, flax, &c., were more fully investigated, as appears in the articles of Violette, Sidot and by Watt's Dictionary, its increased efficiency for electric lighting purposes when prepared at very high temperatures, for which purposes it had already been used, was noticed. Of the patents, De Moleyn (Eng. pat. 9053, of 1841) used pulverized boxwood charcoal for producing incandescence in an exhausted electric lamp; Greener and Staite (E. P. 11076, of 1848) used in an air-tight lamp chamber, an incandescent conductor made from powdered charcoal pressed into shape and then further carbonized, which would have the effect of bringing the charcoal to a higher state of carbonization and make it a more perfect carbon; Shepherd (Eng. pat. 13302, of 1850) used a charcoal pencil for incandescence in an exhaust lamp chamber; Roberts (Eng. pat. 14198, of 1852), used a charcoal slip or pencil for incandescence in an exhausted lamp chamber; Binks (Eng. pat. 119 of 1853) used electrodes formed by carbonizing lignite which is a vegetable fibrous material, and also used thin plates or cuttings of charcoal or charcoal veneer; Hamson (Eng. pat. 588 of 1857), made electric light pencils by subjecting small rods or pencils of wood charcoal to further carbonization; Burleigh and Danchell (Eng. pat. 3164 of 1857) formed carbon pencils by moulding powdered charcoal and then subjecting the formed material to further carbonization; and Ladyguine (Journal of Society of Arts, 1872–3), used incandescent charcoal in a lamp chamber filled with an inert gas.

In view of these patents and publications, I cannot see that there is any novelty in the use of vegetable fibrous carbon as the incandescent conductor of the lamp of the patent in suit. It is old as a material and its use for the burners of incandescent electric lamps is old. The anticipating patents and publications describe the method of preparation and carbonization more fully than does the patent in suit, and it does not appear that the patentees of the patent in suit have improved the carbon by introducing any new features in its method of preparation. As to this the patent 738 in suit says that the method of preparation is old and does not describe it. From their statement in the patent in suit that the method of preparing the vegetable fibrous carbon is old, it might be inferred that the material was old and that its method of preparation was old, but that the use of the particular carbon for the burner of an incandescent electric lamp was new and that the novelty consisted in substituting the fibrous vegetable carbon for gas-retort carbon for that purpose; but it will be seen that even a new use of an old material, or the substitution of one old material for another cannot be said to be a novel feature of the patent in suit, since the same material is shown by the prior patents and publication to be old for the same use.

Some of the patents and publications refer to the material as "wood charcoal," others as charcoal prepared from some particular wood, while others speak generally of "charcoal." The term charcoal when used alone and without any qualifying adjective means wood carbon, since that is the ordinary form of charcoal. In the original application for the patent in suit, the patentees made a correct use of the term when they referred to "wood carbon" and "charcoal" as meaning the same thing. "Animal charcoal" is always referred to as such, or more usually as "bone black."

As to the form of the burner, Staite (E. P. 12212 of 1848) used a true arch form for his incandescing burner in a lamp chamber, the burner being made of the metal iridium. Gardiner and Blossom (U. S. patent No. 20706, dated June 29, 1858) used as a burner a platinum coil as an incandescent conductor burned into the form of an arch in a lamp chamber; while Konn (Eng. pat. 3809 of 1872 and 91 of 1873) used a V-shaped carbon burner inclosed in a hermetically sealed glass chamber filled with nitrogen, and he says, referring to the shape, that "other shapes may be used." The advantages of the shape are present whatever may be the material, whether it is metal or carbon.

739 From the foregoing statement it follows that I fail to find a single feature of novelty in the apparatus described and illustrated in the patent in suit.

The inventors, Sawyer and Man, made no substantial advance in the art, or none, at least, that is shown or described in the patent in suit. They simply repeated the experiments of earlier patentees and experimenters without producing as a result of their experiments a lamp that was more practical than those that had gone before. Certainly none of the credit of the production of the modern incandescent lamp which has made electric lighting by incandescence a possibility can be given to the patentees of the patent in suit by reason of anything that is therein described or shown.

6 Q. Referring now to the first claim of the patent in suit, state whether or not in your opinion there is any novel and useful invention described therein, giving your reasons for any opinion you may express?

A. The first claim of the patent in suit describes an incandescing conductor for an electric lamp made "of carbonized, fibrous or textile material and of an arch or horseshoe shape." The shape being old, as stated by me in my last answer, in metal and in carbon, and the material or particular kind of carbon being old, also as stated in my last answer, I cannot see that the conductor is given any element of useful novelty by taking the old material and giving it the form which has been used for the same purpose in metals and in carbon from other sources.

7 Q. Do you agree with the opinion expressed by complainant's expert, Mr. Pope, in answer to X Int. 119, that the advantages of the material are substantially independent of the form in which the material may be in?

A. I do. I may go further and say that I think they are entirely so.

8 Q. Referring now, to the second claim of the patent in suit, state whether or not, in your opinion, there is any novel and useful invention described therein, giving your reasons for any opinion you may express.

A. The second claim is for a combination, the elements of which seem to be "an incandescing conductor of carbonized fibrous 740 material," and "a transparent hermetically sealed chamber, in which the conductor is enclosed." The electric circuit is mentioned in the claim, but since all incandescent electric lamps are intended to be used in an electric circuit, and all have means for connection with the circuit wires, I take it that the statement in the claim only makes certain the character of use of the apparatus. In this claim, the form of the burner is omitted, and the invention is made to rest on the combination of the burner of a particular kind of carbon with the lamp chamber.

If it is to be considered that no valid combination between a carbon burner of a particular kind of carbon, and a transparent hermetically sealed chamber exists, then any of the incandescent electric lamps, of which a number have before been referred to, having such a chamber, and using a carbon burner of another kind of carbon, such as gas carbon, or even using a metal, would, in view of the general knowledge that wood carbon, gas carbon, and other forms of carbon, and various metals may all be used for producing electrical incandescence, deprive the claim of all novelty. But if the combination is to be considered a valid and operative one and one that can only be deprived of novelty by finding the peculiar carbon in the peculiar chamber, then the patents of De Moleyn, Greener & Staite, Shepard & Roberts, and the publication of Ladyguine, form each an anticipation of the combination. These lamps in addition all have circuit connections and are described as used in an electric circuit, so that the conditions which may be meant by reference to the electric circuit in the claim, are also present in these lamps.

9 Q. Referring now to the fourth claim of the patent in suit, state whether or not, in your opinion, there is any novel and useful in-

vention described therein, giving your reasons for any opinion you may express.

A. The fourth claim of the patent in suit is for a combination of three elements—the chamber, the circuit conductors leading into it and the burner. The chamber, which is the first element, is stated to be made wholly of glass, hermetically sealed, and out of which all carbon-consuming gas has been exhausted or driven, 741 which refers, I take it, to the fact that the chamber of the lamp has a glass bottom plate sealed by clamps and cement to the bottom of the globe and the air is exhausted from the globe and a vacuum left in it, or it is filled with nitrogen or hydrogen gas. The electric circuit conductors, forming the second element, are described in the claim as "passing through the glass wall of said chamber and hermetically sealed therein," which, I take it, refers to the fact that the holes through which the conductors pass are sealed air-tight with cement; the burner, which is the third element, is described in the claim as "of carbon made from a fibrous or textile material, having the form of an arch or loop."

The lamp chamber and the circuit conductors (the first two elements of the claim) are the same as in the early patents to the same patentees (205,144 and 210,809). They are also the same as the chambers and conductors of De Moleyns, Greener & Staite, Staite, King, Shepard, Roberts, Konn (72 and 75), Kosloff (Eng. pats. and U. S. P.), Woodward and Ladyguine, as I have explained in answer to question 5. This leaves only the burner to be considered—its material and form. In fact the claim becomes simply the putting of the burner of the first claim into the old lamp chamber, or the same thing as the second claim with the form of the burner added. As stated in my answer to question 5, the material is old in other forms and the form is old in other materials, and the advantages of the form are independent of those of the material. The combination of the three elements of the fourth claim, when the form of the third element or the burner is disregarded, is found in a number of patents and publications, while if the material of the burner is disregarded the combination of the three elements is found in other patents or publications.

Taking the patents of Roberts (E. P. 14198 of 1852), and Konn (Eng. pat. 3809 of 1872), for illustration; they both describe lamps having the two circuit conductors entering from one side of the chamber and terminating in clamps for holding the carbon burner, which clamps are in the same horizontal plane. Roberts 742 has a straight fibrous carbon burner, while Konn has an arch-shape hard carbon burner. No change would have to be made in either lamp in order to exchange the carbon burners, and the straight burner of Roberts has the same substantial advantages as the arch burner of Konn and of the patent in suit, since if the Roberts lamp is reversed in its position there will be no obstruction to the downward reflection of the light.

The advantages of the material being independent of the advantages of the shape, I do not see what novelty is left for the combination described in the fourth claim of the patent in suit.

10 Q. You have stated in your answer to Q. 5 that the inventors Sawyer and Man made no substantial advance in the art, or none at least that is shown or described in the patent in suit. Please state what in your opinion was the advance in the art that marked the departure from the old and unsuccessful lamps towards the modern and successful incandescent lamp?

A. In the older forms of incandescent lamp the glass chamber employed for maintaining a vacuum or for containing non-combustion supporting gases was usually of considerable size and thickness and not made continuously in one piece. Several disadvantages were attendant upon this fact, first, owing to the fragile character of glass and the large dimensions, unequal expansion and different parts dependent thereon, the whole was liable to fracture and so destruction. Moreover, with any such device it was very difficult if not impossible to maintain, even for a moderate period, a sufficiently high vacuum in case the incandescing conductor was placed in a vacuum; and in case it were not placed in a vacuum but in some gas which does not contain oxygen, the conductor if sufficiently small was liable to injury from the so-called washing of the contained gas, an effect which is due to the rapid and continuous collision of its particles against the hot body. Moreover, in order to practical success it was necessary that the leading conductors which pierce the glass chamber for the introduction of the current should be hermetically sealed in the proper sense of the word, that is, should be composed of some material which, 743 while able to convey a current, does not greatly differ in its coefficient of expansion from the gas through which it passes so that the two may be fused into mutual and close connection. And again, as making the art of incandescent lighting successful, it was necessary that the size of the incandescent conductor be so reduced that it should offer a very high resistance to the passage of the current in order that the electric energy might be conveyed to the lamp with a high potential and small current instead of, as had been the practice in earlier times, with a large current of low potential, for thus the cost of the distributing conductors could be greatly reduced and so the art put in economical practice. The modern incandescent lamp combines the various features which have been pointed out, namely, continuous chamber, hermetical sealing, practically complete exhaustion, and incandescing conductor within the chamber, offering a high resistance.

11 Q. Where, first, do you find set forth the embodiment of these conditions which you have stated are the elements of the modern incandescent lamps?

A. They appear to me to be first set forth in United States patent 223,898, January 27, 1880, to Thomas A. Edison.

12 Q. Referring to the lamp structure described and shown in the patent in suit, what, if any, would be the practical defects of such a structure in your opinion?

A. It would, in my opinion, be very difficult to maintain in such a structure a nearly perfect vacuum even though it could be produced. Such a structure would offer very serious obstacles in the production of such a vacuum from the large amount of surface to which air or other contained gases would be necessarily adherent, and which would fail to be removed by the pump; and even supposing that it could be so produced, it would be very difficult to maintain such a vacuum owing to the necessary imperfections in the joining of the portions of which the chamber is composed, namely, the upper or tubular portion furnished with a flange to the lower glass plate through which the conductors pass.

744 Such a lamp would be open to all the disadvantages attendant on pneumatic apparatus in which it is sought to obtain and maintain a vacuum from imperfect closure of the joint, or in other words, from leakage. Another practical disadvantage of the structure shown is that the incandescent portion is necessarily so large and of so short length as to offer very little resistance, and, therefore, require a current of greater intensity and lower electromotive force, making, therefore, a lamp that would not be practicable.

13 Q. Considering the structure of the lamp of the patent in suit as illustrated in the drawings of the patent, would it be practically feasible in your opinion to seal the glass plate *y*, to the flange, *x*, by fusion of the glass?

A. I do not think it would.

14 Q. Would it be feasible in your opinion in such a lamp structure to fuse the glass plate upon the tubular conductors which are shown as passing there through?

A. I think not, and I will give as a reason for the opinion I express that in order that this may be done safely, the tube itself must be composed of such conducting substance, and, therefore, metallic as shall have a coefficient of expansion under all changes of temperature substantially the same as glass. Only one such metal is known, and even in that case the difference in the coefficient of the expansion, and that of glass is sufficient that when a large wire or a tube offering a large surface is brought in contact with glass so fused, the unequal expansion between the two is so great as in a short time to fracture the surface of the glass in contact with the metal and render the contact between the two less intimate, and so subject to leakage. This, however, with a small wire does not occur, since it can accommodate itself to the changes of temperature without producing fracture of the glass in contact with it.

15 Q. Would the lamp structure of the patent in suit in your opinion be suitable for maintaining with sufficient stability any definite condition of the atmosphere within it whether a vacuum or non-combustion supporting gas to make the lamp a practically useful structure for the purposes of electric illumination?

745 A. In my opinion it would be wholly unsuitable for such purpose.

16 Q. Please state whether or not in your opinion there is a sufficient description in the specification of the patent in suit as to the character of the fibrous material to be used for the burner, its selection, its preparation for carbonization and its carbonization to enable others generally skilled in the art as it existed at the date of

the application, namely January 9, 1880, to produce a practically operative incandescent conductor without experiment?

A. I do not think there is enough of direction or explanation to enable one to produce such a conductor as the question names. First, as to the selection of materials, the patent is indefinite. In the specification we find the inventors to declare that they have used carbonized paper and also wood carbon. In my opinion it would not be sufficient, if paper were to be resorted to, simply to state that fact, inasmuch as papers are manufactured and are well known in a great variety of forms having a great variety of properties. Some of them, beside the fibrous material of which they may be supposed to be chiefly composed and on which their integrity depends, are loaded with mineral and earthy matters, some of them containing more or less of chemical substances, as alum, all of which, leaving mineral residue in the part remaining after carbonization, would render it liable to fusion and so to destruction, while other papers have such great want of uniformity in the disposition of the fibres of which they are composed that the carbonaceous residue left after incineration would not be of uniform texture, but would be more or less dense at certain portions, and more or less wanting in density at others, and the result in the use of such material would be very irregular heating on the passage of the current, and probable destruction of the continuity of the conductor by a process which would be set up very similar to that which goes on between points of carbon when the arc light is produced. As respects the use of wood for the same purpose, a very similar line of remark is applicable. Out of the great variety of woods known to us, very few will furnish a material which, on carbonization, would be applicable 746 to this purpose, the reason being very much the same as that which has been assigned for the failure in case paper were used. More in detail: In the woods with which we are familiar in temperate climates, the distribution of woody matter in any given mass of wood is very irregular, and the relative amount of real wood present in a given bulk is not infrequently very inconsiderable when compared with the bulk. It is noticeable in the wood from the conifers which is made up mostly of wood disposed in cells very large as compared with the air spaces between them. In most of the exogenous woods the disposition of the fibres of the wood is such that no continuous small rod could be cut from it such that every cross-section of it would represent the same amount of woody material as every other. This results from the fact that in the structure of such wood, beside fibres which are more or less parallel, there are others present which cross these, and so turning the fibres aside from their straight and regular course would render it certain that in attempting to cut from such wood a regular form, some of the fibres would be cut across, the result being irregularity in the distribution of the matter in the finished product, and when an electric current is transmitted through such material, those portions in which the carbon residue is least abundant in cross-section would be most intensely heated, and the process technically known as "arcing" set up, by which the conductor would be destroyed.

It seems to me, therefore, that one setting himself to construct a lamp in accordance with the patent, supposing that such a lamp could be successfully made, would find in addition to the task set before him in the patent, a full field of experimentation into which he must enter and make trial with various papers or woods before he could hope for success. As to the process involved in the reduction of the raw material to the form of carbon, suitable for this purpose the patent gives no sufficient disclosure. For these reasons I think not enough is disclosed to enable one skilled in the art to make a practically operative conductor.

747 17 Q. In making such a conductor from wood carbon, is it in your opinion essential to operativeness that the material should be cut from the wood in one way rather than in another and if so do you find anything in the specification of the patent in suit to indicate how this is to be done?

A. In my opinion it is of vital importance that the material should be cut from the wood, supposing a proper one to be selected so as to have the form or extended length of the conductor taken from the wood along and parallel with its fibrous structure rather than cut across the grain; for only in the former method could we hope to secure sufficient uniformity of material or homogen-ousness of structure in the carbonized residue. There is nothing whatever mentioned in the patent with respect to the necessity of this or any direction given as to the mode of carrying it out.

18 Q. How large a proportion of vegetable growths even if the material were prepared for carbonization and carbonized with the advanced skill of the present time would in your opinion be at all suited for manufacture of incandescent lamp carbons or would make a lamp which would be practically operative?

A. In my opinion only an exceedingly small fraction of the whole number of growths known to us would fulfill this condition, and it may not, perhaps, be amiss to give my reason. If we examine the class of grasses, it will be found that the structure furnished by the stems or the leaves, or indeed by any part of such grasses, does not possess sufficient homogen-ousness of structure and uniformity of density in material to fulfill the conditions required. When the silicious outer covering of the straw is removed we come upon a structure which varies in density in such a way that in my opinion it would be almost, if not wholly, impossible to shape conductors from them possessing a requisite uniformity, and if we turn to the exogenous woods the same remark is true in a higher degree perhaps. The separate annular layers of wood have not uniformity of density throughout their entire extent, but on the contrary it varies somewhat with the advance of the season during which it is deposited, and between the annular layers

748 or at that portion which lies between the central parts and the contiguous annular layers the wood is very open and spongy. Moreover, the wood is generally traversed in the direction of its length with cellular structure, giving to it such a character that the residue after carbonization would, in my opinion, be wholly wanting in the characteristics requisite for such a conductor, and I

believe it has been found by experiment that such woods are quite unsuited to the purpose generally. It is only in that small class, and only comparatively few members of that, even, that present the pith, the cells and the whole structure bundled together in parallel distribution known as indogenous plants that I should expect to find success in carrying out the invention. When I say this I do not mean that such knowledge was generally in the possession of scientific men at the time of the application of this patent, but that it has been subsequently discovered. Answering the question specifically, then, I say only a very small number of materials indicated in the question would be found suited.

19 Q. Did there, in your opinion, exist in the general knowledge of the art prior to Jan. 9, '80, a sufficient knowledge of the conditions relative to the selection of the material and its preparation for the purpose of making burners for incandescent lamps to make the statement contained in the patent in suit in regard to the material and its preparations sufficiently definite to enable persons skilled in the art without further experiment to produce a practically operative conductor or burner for incandescent lamps?

A. I do not think there did.

20 Q. Referring to the original application for the patent in suit and to the patent as issued, please state whether or not, in your opinion, the same substantial invention is described and claimed in the original application that is described and claimed in the patent in suit?

A. In my opinion the invention described and claimed in the original application could only be said to be the same invention as described and claimed in the patent in suit in the most remote and general sense. It appears to me that a decided change in the relative importance of the elements set forth has been made. In the original application I find the following language: "Our present invention specially relates to the incandescent conductor; its object is to secure a cheap and effective apparatus, and our improvement consists in the employment of an incandescent arc of carbon in the circuit as a light-giving medium." In the patent as issued it is stated: "Our invention relates more especially to an incandescing conductor, its substance, its form and its combination with the other elements composing the lamp. Its object is to secure a cheap and effective apparatus, and our improvement consists, first, of the combination in a lamp chamber composed wholly of glass, as described in patent No. 205,144, of an incandescing conductor of carbon made from a vegetable fibrous material in contradistinction to a similar conductor made from mineral or gas carbon, and also in the form of such conductor so made from vegetable carbon and combined in the lighting circuit with the exhausted chamber of the lamp." In the application, it is further remarked: "Our improved burner or incandescent arc consists of an arch-shaped or semi-cylindrical piece of carbon, A, mounted in its clamps." In each of the claims the arch shape is a prominent feature and appears to be regarded as such in the invention. In the patent as issued this feature sinks into relative 749 insignificance, prominence being laid upon the carbonized fibrous or textile material. In claim one of the patent as issued the language is: "An incandescent conductor for an electrical lamp of carbonized fibrous or textile material and of an arch or horseshoe shape." It will be seen that the simple arch shape in the application is the last-mentioned feature in the claim and has a correlative or partially equivalent form mentioned in connection with it. The second claim also of the patent as issued mentions the material but omits the form. In the fourth claim the form is stated to be that of an arch or loop. It thus appears to me that there is a wide departure in the scope of the patent as issued from that which was embraced in the original application. 750 In the application the applicant states, "We have tried carbonized paper covered with powdered plumbago, wood carbon or charcoal, and ordinary gas carbon." In the patent as issued they say: "In the practice of our invention we have made use of carbonized paper and also of wood carbon." In the language employed in the application the carbonized paper is covered with powdered plumbago. No such fact is mentioned in the patent as issued. Also in the patent as issued it is to be noticed that they omit to mention the use of gas carbon. It thus appears that at the time of the issue of the patent in some way an advance had been made in the art in the direction of success as it has been finally secured in practice which was not exhibited in the original application, and so the scope of the patent as issued is, it seems to me, different from that set forth in the original application.

21 Q. I call your attention to the fact that in the original application "wood carbon or charcoal" is stated as one of the materials used, while in the patent as issued this is replaced by the words "wood carbon." Do you attach any significance to this change?

A. It seems to me that the omission of the words "or charcoal" would tend to direct the mind of one skilled in the art away from a material of a very general character to one more specific, and that thus one may see that the patentees are following along in the line which had already successfully been entered upon by others and by a skillful use of language were endeavoring to cover an essential improvement in the art of incandescent lighting, which if covered at all in the earlier application was so vaguely covered as to be of no practical use.

22 Q. I call your attention to the fact that the original application says, "We have tried carbonized paper covered with powdered plumbago," and that no further description is given than that of what is meant by the paper carbon mentioned in the third claim of the application. Please state whether or not, in your opinion, the 751 expression "carbonized paper covered with powdered plumbago" had any definite and ascertained meaning in the art at the date of the application.

A. I do not think it had. Moreover, the expression seems to me ambiguous in its character. Certainly with no further knowledge than was extant at the time of the application, I believe one would hardly know whether paper was first to be carbonized and then covered with plumbago, or whether the paper was to be covered with plumbago and then carbonized, and whichever is to be done there are no directions given for the doing.

23 Q. Assuming that the expression means that paper such as blotting paper is to be filled as thoroughly as possible with powdered plumbago by rubbing and hammering the powdered plumbago into it, and that then it is intended to carbonize the paper by passing an electric current through it, what would be the result of such a process in your opinion, and would it have any degree of usefulness in the manufacture of burners for incandescent lamps?

A. I answer the question as it stands, that it seems to me no possible warrant in the language for such an interpretation exists since the expression is, "covered with powdered plumbago;" but supposing plumbago to be rubbed and hammered into the texture of the paper so that it could convey a current and then the current were applied, if this were done in the open air, the probability is that at the points where the ordinary metallic conductors come in contact with the paper so filled with plumbago, the paper itself would be consumed, or if this were not the case it is hardly probable that the plumbago could be so equally and uniformly mixed as to offer the same resistance throughout the whole extent, and if not, wherever the resistance were greater, owing to the scarcity of the plumbago, the carbonization would first take place and would be carried to excess, the texture being burned out and the continuity of the structure interrupted and the carbonized conductor destroyed. It would seem to me, therefore, that if any success were to be obtained, the operation must be
752 carried on in an exhausted vessel, and then, even, it seems to be very doubtful if one could succeed in carbonizing the paper at all uniformly. But supposing this were done, there would still remain the want of uniformity in the texture of the paper which is essential to a homogen-ous and uniform conductor such as must be employed in an incandescent lamp. It, therefore, seems to me that the entire direction is vague, indefinite and not likely even with the light which we have at present to be successful in whichever way it were attempted to be carried out. Of course, I do not mean to deny that once in a while out of many trials some partial success might in some way be obtained but nothing practical.

24 Q. I call your attention to the fact that the original application for the patent in suit speaks of "wood carbon or charcoal" as one of the forms of carbon employed. Please state what you would understand by that expression as the art was generally known at the date of the application.

A. The expression "wood carbon or charcoal" would mean, I suppose, nothing other than the carbonaceous residue which remains after burning the ordinary oxogonous woods commonly known in this country. That is certainly its ordinary signification.

25 Q. I call your attention to the fact that in the patent as issued the lamp chamber is described as "composed wholly of glass," and that at another point it is stated "that the entire wall of the chamber is formed of glass," and that at another point in the

specification of the patent in suit it is stated that "another important advantage resulting from our construction of the lamp results from the fact that the wall forming the chamber of the lamp through which the electrodes pass to the interior of the lamp is made wholly of glass by which all danger of oxydation, leakage or short circuiting is avoided;" while in the original application for the patent in suit no such specific description is given of the lamp chamber. Please state what significance, if any, you attach to this change between the original application and the patent as issued.

753 A. It would seem to me that the change in language pointed out in the question would indicate that the patentees were endeavoring to cover a lamp chamber better adapted to, and more in accordance with, the requirements which the subsequent progress of the art had shown must be met. The language would certainly seem to be better adapted to indicate such a form of lamp chamber as in recent practice of the art has been found to be suitable.

26 Q. If that expression "made wholly of glass" has been applied to any particular character of lamp, kindly state what the kind of lamp is and where you find the expression first used.

A. Equivalent expressions are first found, I believe, in patents granted to Thomas A. Edison, No. 223,898, January 27th, 1880, and is also found in 227,229 May 4th, 1880, for an incandescent lamp. In the specification the patentee points out the disadvantages which have attended the construction of lamps prior to the date of the said patent respecting the difficulty of making them maintain a vacuum, and he shows that his intention is to construct the chamber wholly of glass and to melt and hermetically seal the platinum wires leading to the incandescent conductor into the wall of the glass, thus suggesting a new line of departure in the construction of incandescent lamps.

27 Q. As used in the patents of Edison referred to by you, what does the expression "made entirely" or "wholly of glass" mean, and is the construction of lamp described in those patents the construction to which that expression has usually been applied since the date of those patents?

A. The expression in the patents referred to means made entirely of glass without joint so that it may be properly said that it is composed wholly of glass, and that the glass is whole, entire, without joint, and it describes the lamp which is usually understood to be meant when one says composed wholly of glass.

28 Q. You have stated that in the patents of Edison referred to an old lamp construction is described, and the fact that it
754 was impossible or impracticable to maintain a vacuum in such a construction set forth, and that the patents then proceed to describe the improved construction, namely, the lamp chamber made wholly or entirely of glass as one in which such a vacuum can be maintained. Please state in what material respect, if at all, the old lamp chamber described in the patents of Edison

referred to as being that used before his invention differs from the lamp chamber described in the patent in suit.

A. In the older lamps, before the invention of Edison, the chamber was either ground to and fitted upon the glass plate and cemented thereto or the approaches to the chamber were guarded by metallic caps which were cemented thereto or in general were closed by devices which were incapable of maintaining for a long period of time a practical vacuum. These decided disadvantages are wholly obviated by the construction which he proposed for it is found that when the only passage into the chamber is by means of platinum conductors hermetically sealed by fusing the glass, that the joint is practically as tight as if no such conductor entered. It is found by fusion of the glass after the exhaustion, and thus making it continuous without any opening, that there is no communication with the air, and consequently no destruction of the vacuum results, which could not be secured in the older practice. In the lamp chamber shown in the patent in suit substantially the old line of practice is followed, namely, portions of the chamber are brought together and attempted to be fitted by joints. Moreover, the conductors are secured to the openings through which they pass by means of cement, thus making it liable to all the imperfections which have been pointed out. In all material respects these points of construction were present in the lamps to which Edison alludes as having been in existence before the date of his invention.

29 Q. I call your attention to the fact that in the patent in suit, referring to the tubular conductors which pass through the holes in the glass bottom plate, *g*, the patent says "the sealing of the electrodes where they pass through the glass wall is done with any suitable cement or in any of the well-known methods of sealing glass upon metal electrodes previous to the filing of this application," while in the original application no such statement was made, and in patent No. 205,144 the glass plate is described as being drilled with two holes through which pass the bolts protected or not by cloth or paper lining, the holes through which the bolts pass being sealed with balsam or some cement. What significance, if any, do you attach to this change between the original application and the patent as issued?

A. It would seem, in view of the language cited in the question, that one might say that the invention as set forth in the patent as issued has been made broader so as to include, is possible, any mode of sealing the electrodes which should not be open to the objections specifically pointed out and shown in the patent referred to in the original application, namely, that which has already been pointed out; the leakage of air into the vacuum when produced which must inevitably occur in such a structure. It appears to be an attempt to make the patent cover the methods of introducing and sealing the conductors into the lamp which are now well known and practiced in the art of incandescent lighting where the incandescent lamp is a closed chamber exhausted and hermetically sealed.

30 Q. Would the structure shown in the drawings of the patent in suit, in your opinion, be adapted for having the electrodes where

they pass through the glass wall, sealed as in any of the well-known methods of sealing glass upon metal electrodes previous to the filing of this application?

A. In my opinion they would not, as I have heretofore pointed out.

31 Q. Are all commercial incandescent electric lamps manufactured at the present time provided with carbons of carbonized fibrous material?

A. They are not. On the contrary, it is the practice in some cases to reduce carbon-holding materials to a homogeneous structure by the immersion of the same in some agent by which they are put in partial solution so as to coalesce or sometimes to be completely dissolved in menstra precipitated, and the resulting compound drawn out into a suitable conductor which may be subsequently carbonized. 756 For instance, woody matters may be put into a plastic condition on being immersed into strong sulphuric acid containing about half its bulk of water, and then those materials may be subsequently formed, and carbonized, gun cotton may be put in solution, and from the solution a non-fibrous material may be prepared from which the incandescing portion of the lamp may be made by carbonization. And various other processes effecting a similar result may be employed and are, as I understand, in the practice of the art.

32 Q. The opinion has been expressed in substances by complainant's experts that the mere mention of carbonized paper in the original application for the patent in suit forms a definite indication that the inventors intended to reduce the fibrous material to shape and size in at least one direction before carbonization. Please state whether you concur in this view?

A. I do not understand the language of the patentees to be intended to be explicit on that point to that extent. I should rather suppose that they intended to indicate in a general way what the conductor was to be made of. And the paper is rather indicative of the material than of any process through which that material might have been put. And I further think that in course of experiments to secure a suitable conductor from that material it is more than likely that one would find it necessary to go through a great variety of experiments not only in the selection of materials to be carbonized, but in the treatment of the carbonized product. For instance, if conductors so produced should not offer sufficient resistance or should not be sufficiently uniform, it is manifest that the experimenter would naturally think of filing, or scraping, or grinding or in some way reducing the thicker portions of the conductor in order to secure uniformity and so better results. And as a matter of fact I believe an experimenter would have to go through some such trial. No doubt if the patentees experimented with such conductors they found it necessary to treat the carbonized product in the way indicated. 757 Indeed I believe I have heard that they stated that a conductor so formed might be cemented to a plane surface and filed, afterwards liberated and re-cemented upon the filed surface and the second surface reduced in a similar manner.

Last part of the answer objected to as hearsay.

33 Q. The patent in suit states, "An important practical advantage which is secured by the arch form of incandescing carbon is that it permits the carbon to expand and contract to varying temperatures to which it is subjected by the electric current, as turned on or off, without altering the position of its fixed terminals. Thus the necessity for a special mechanical device to compensate for the expansion and contraction which has heretofore been necessary is entirely dispensed with, and thus the lamp is materially simplified in its construction." Please state whether or not in your opinion a carbon conductor of the size of that shown in the drawings of the patent in suit would be given the advantage mentioned in the manner just quoted from the specification of the patent by reason of its having the arch or semicircular form shown in the drawings?

A. I do not think it would. As shown, the thickness relative to its other dimensions and relative to the chamber itself is such that supposing the conductors to which it is attached to be rigidly fixed then a notable expansion ought to occur in the incandescing conductor; I do not see that any advantage would be given to it by its curved shape, for it would be, in my opinion, quite as likely to break in the form shown as it would be in the form of a rod, as had been in the art before.

34 Q. Is there any such advantage in the modern incandescent
lamp arising from its capacity to contract and expand with-
758 out breaking or disturbing the position of the fixed terminals,
and if so, to what is that advantage and operation due?

A. In my opinion there is such an advantage in the modern fixed lamp. It is due primarily to the thinness and consequent flexibility of the conductor and to its great length, both of which would enable it, if expanding between fixed points, to flex laterally or to curve itself in any direction to accommodate itself to any increased strain upon it, and so, liability to rupture, in my opinion, is not present. As a matter of fact it does not usually occur.

35 Q. Would that characteristic of the carbon conductor in the modern lamp be present, whatever its form, whether that of a loop, or a straight piece?

A. It undoubtedly would, owing to the fact which I have just mentioned, namely, its minute diameter, and its great length.

36 Q. What, then, is the advantage, if any, of using a loop form of the conductor, such as is used in the modern lamp?

A. The primary advantage is to allow a great length of conductor.

37 Q. I called your attention to the fact that the matter quoted from the specification of the patent in suit in my question No. 33 does not appear in the specification of the original patent as filed. What significance, if any, do you attach to this difference between the original application and the patent as issued?

A. It would seem to me to be rather designed to make the patent cover the advantages of a device which were not clearly shown in the drawings, or set forth in the specification of the original application; namely, to give to the incandescent conductor of the lamp a property by implication, involved in the language which was, in my opinion, really not present in the lamp as shown in the original application, but which is embraced, and is necessarily useful in modern incandescent lamps.

759 PRINCETON, NEW JERSEY, *March* 11, 1889—8 p. m.

Present: Mr. Dyer, Mr. Curtis.

Professor CYRUS F. BRACKETT—cross-examination.

By Mr. CURTIS:

37½ X Q. To which of the patents and publications referred to in your answer to question 5 do you particularly refer in your answer to question 6?

A. So far as the portion of the answer relating to the shape of the conductor is concerned, attention may be called to the lamp described in the English patent to Staite, Konn, 3809 of 1872, and 91 of 1873, and U. S. patent to Gardiner and Blossom. As to the material, I may refer to the papers from the Philosophical Transactions, the collected works of Sir Humphrey Davy, and that of Violette and Sidot, Comptes Rendus, Watts' Dictionary, edition of 1863 and 1875. English patents to De Moleyn, Greener and Staite, Shepard, Roberts, Binks, Burleigh and Danchell, Harrison, and the publication of Ladyguine's light.

38 X Q. Do you find in either of these patents or publications, taken by itself, a description of an incandescent conductor for an electric lamp of carbonized fibrous, or textile material, and of arch or of horseshoe shape?

A. No; I believe they are not both present, both the carbonized fibrous material and the horseshoe shape in any one of the publications named.

39 X Q. Which one of these, if any, do you consider an anticipation of the first claim of the patent in suit?

A. There is no one of them that singly presents an incandescent conductor of carbonized fibrous material, and at the same time of an arch or a horseshoe shape, but it seems to me that the form being old and the material being old, nothing new is disclosed in this claim which was not previously well known, for I cannot 760 conceive that there would be any invention in taking a form which was old and a material which was old, and both used for the purpose of an incandescent lamp, and bringing them together.

40 X Q. Then, as I understand, you find one characteristic of the conductor of the first claim of the patent in suit in some of the publications and patents, and the other characteristic in other patents or publications, and you do not think it would constitute invention to put the two together and thus make a conductor like that described in the claim?

A. The statement in the question expresses my opinion, and my reason is that whatever of advantage there may be in the form, if any, it appears to me does not depend upon the material; and whatever advantage there may be in the material does not depend upon the form. And both the form and the material being old, as shown in the previous answer, my opinion with reference to the claim is as stated, that it does not disclose any invention.

41 X Q. Which one of the patents or publications to which you have referred contains, in your opinion, the most satisfactory and complete description of an incandescent conductor for an electric lamp of carbonized fibrous or textile material without reference to the shape of such conductor?

A. The material which would result from the process of treatment described by Violette to which reference has been made, would, it seems to me, be more likely to fulfill the conditions required in a practical lamp than would be likely to be embodied by the use of what is commonly understood as charcoal or carbonized wood. It seems to me also that the material which would result from the process of Sidot would likewise have some of the characteristics which would be required. Also material described in Binks' English patent which consists of carbonized lignite. The Violette publication I refer to is found in "American Journal of Science and Arts," vol. 16, 1853, page 270. And Sidot's process is described in "Comptes Rendus," tome 70, page 605.

761 42 X Q. These two publications and the English patent to which you refer, contain then on the whole the best description you can find in any of the patents or publications referred to in your answer to question 5 of an incandescing conductor for an electric lamp of carbonized fibrous or textile material?

A. I think so. I do not remember one better than this would be likely to be.

43 X Q. Referring now to your answer to question 8, do you find in either of the patents or publications there referred to taken by itself, all of the elements of the combination of the second claim in the patent in suit combined as described in the specification of the patent?

A. The claim appears to be a combination claim. If we are to take into account the transparent or glass chamber adapted to be sealed in some way to which electric conductors are fixed so that the current can be led into it, as is the case with all incandescent lamps, and indeed all lamps for electric lighting, and if the incandescent material is to be of carbonized fibrous material, then everything set forth in the claim is to be found in patents to which allusion has already been made, and notably English patents De Moleyn, Greener and Staite, Shepard, Roberts, and the publication of Ladyguine in the "Journal of the Society of Arts," London, 1872–'3, volume 21.

44 X Q. Does either one of these patents or publications contain, in your opinion, a better description than the others of the combination of the second claim of the patent in suit, or are they all equally good?

A. I have not carefully considered that question, and should want to review the exact statements and drawings made with reference to them before expressing an opinion.

45 X Q. Will you kindly do so?

A. It would seem that the lamp shown and described in English patent to Roberts and also the English patent to Shepard and the Ladyguine lamp publication described in the "Journal of the Society of Arts." It would seem that it would be among those 762 which one would select as better fulfilling the condition in the question.

46 X Q. If you were to make any selection among these last, which would you select as on the whole best fulfilling the conditions of the preceding question?

A. My present impression is I should select Roberts, though I confess I have not given very much attention to that particular phase of the subject.

47 X Q. But you think that the Roberts patent is certainly as good as any of the others for this purpose?

A. I think it might be.

48 X Q. Do you think that all the patents and publications you have referred to in your answers to the last three questions are direct anticipations of the second claim of the patent in suit?

A. It seems to me that they are. Some of them, I think, certainly are. They appear to present everything which this combination calls for.

49 X Q. Which of them do you think certainly are?

A. I am not prepared to say that they are not all of them. They certainly present the incandescing conductor of carbonized fibrous material. They are presumed to be furnished with connections for the electrical circuit of course in any case, and they are enclosed in a transparent chamber capable at least of being as completely hermetically sealed as is the lamp described and shown in the patent in suit, and claimed in claim 2.

50 X Q. Referring now to your answer to question 9, do you mean to express the opinion that either of the patents or publications there referred to is a direct anticipation of the fourth claim of the patent in suit?

A. Implicitly, yes. By implication it is there in several of them. In the English patents and publications to which allusion has just been made are found a transparent chamber adapted to be pumped out and sealed or to contain an atmosphere not composed of oxygen; they are furnished with conductors for the introduction and utilization of the electrical current; they utilize an incandescing conductor made of carbonized fibrous material, and although 763 they do not show this in the form of an arch or a loop, yet the advantage of the material, whatever that may be, is present, and further it may be remarked that in the form of an incandescing conductor shown in the patent in suit no substantial advantage is secured as regards permanence of connection with the metallic electrodes to which it is attached, and since the form of the incandescing conductor shown is made in other materials, it seems to me that so far as this element alone is concerned the substitution of carbon for metal, which was shown in one of the patents already alluded to, prevents the claim entirely from including any patentable novelty.

51 X Q. In which one of the patents and publications to which you have referred do you find on the whole the best description of all the elements of the combination of the fourth claim of the patent in suit combined in the manner there described?

A. As regards the form, the English patent to Staite; as regards the material, those which I have just mentioned in answer to 43 X Q. I have, however, omitted to mention that in earlier patents granted to the same patentees substantially the same structure of lamp is shown so far as the chamber, the electrical connections and means of exhaustion are concerned. The incandescent material, however, is in a different form.

52 X Q. In which of the prior patents and publications do you find the best description of the whole combination?

A. If we might substitute for the carbonized fibrous or textile material a structure of carbon which was not fibrous, but which would have in such lamp substantially the same properties, I should mention English patent 3809 to Konn, 1872. The lamp, although not having a chamber wholly of glass, but being closed with metal plate, is, in my opinion, however, quite equivalent in that respect since no advantage comes from a glass plate, the metal plate being quite as easily fitted and quite as firmly secured, even better. In all other essential respects I should regard the lamp as the equivalent, inasmuch as the electrical connections, the exhausted 764 chamber or one that may be exhausted, the carbon incandescent body, which in a lamp of that sort would be quite the equivalent of the fibrous material, and supposing the lamp to be efficient, I see no reason why Konn might not be regarded as a complete equivalent. It is true that in exact terms of fibrous material the Konn combination is not the equivalent of the other. But for practical use I think it would be quite.

53 X Q. Have you assumed throughout your deposition with regard to the patent in suit that such a carbon conductor as is described in the Konn patent referred to is the full equivalent for the carbon conductor made of fibrous or textile material described in the patent in suit?

A. When comparing lamps of low resistance and therefore adapted to a current of great intensity I should so consider them although I have not been influenced by that consideration. When considering a lamp of practical utility in the modern sense an incandescent lamp, I should by no means regard the material used for the incandescent conductor which might be obtained from suitable fibrous material as the equivalent of that which probably would be obtained in the treatment of hard gas coke, as is shown in the patent of Konn.

54 X Q. Do you think then that for lamps of low resistance the two are equivalent but not for lamps of high resistance?

A. Hardly that. But I think that for lamps of high resistance what is commonly known as gas carbon would be a very poor material with which to construct the incandescing conductor owing to the difficulty in manipulation. I should expect better success in the construction of such lamps in the use of suitably chosen fibrous material cut to form, and carbonized. By this answer I mean by no means to deny that if it were possible practically and in a commercial way to construct lamps having incandescent conductors of small cross-section in great length from gas coke which might be perhaps made in sufficient density and uniformity, such lamps might in my opinion take the place of those constructed by 765 the ordinary well-known modern practice. I do not, however, believe it is possible, and in comparing the lamp of Konn with any other lamp in which the incandescing conductor is made of fibrous material, I should think that an injustice would be done the latter construction.

55 X Q. In your answer to question 16 you state in substance that the patent in suit does not in your opinion contain sufficiently definite instructions in regard to the making of the carbon conductor to enable one skilled in the art and knowing only what was known in regard to such subjects prior to 1880 to make a practically useful incandescent conductor from carbonized fibrous or textile material. Please state what further directions ought, in your opinion, to have been given in the patent in suit, on this point in order to make the patent sufficiently definite and explicit.

A. "Fibrous" and "textile" are words covering a great variety of substances, and in that variety of substances are found very diverse qualities. I do not believe that either "fibrous" or "textile" is a sufficient definition of the material which must be employed for carbonization in order to produce a practically valuable lamp for electric lighting by incandescence. As already pointed out in answer to a question in this direct examination, I have remarked that there is great want of uniformity in the structure of most woods, vegetable substances which would naturally be employed for this purpose, for I take it the patent does not mean substances of animal origin, since it is the usual custom when such bodies are reduced to the form of coal to specify by the addition of a distinctive word such as "animal" charcoal. The constructor who should undertake to make a lamp with all this uncertainty and vagueness would in my opinion find himself totally wanting in that explicit direction in the choice and treatment of his materials which would properly be employed so that he would be obliged himself to become an inventor, or perhaps better, a discoverer, by entering upon a wide range of experimentation. I do not for this reason think that sufficiently explicit direction is given. I do not 766 mean, however, to say that one might not with what is set forth in the patent construct some sort of a lamp with which some unsatisfactory result might be secured; but a practical one I do not believe he would obtain, for he is not told what to select or how to treat it, as I think he ought to be.

56 X Q. In view of our present knowledge, what direction ought

to have been given in regard to selection and treatment of the material?

A. It seems to me at least a class of fibrous substances to be employed should have been named, since the great majority of such things turn out to be wholly unfit for such use. It seems to me it would have been well also to point out the exact mode of carbonization so as to procure the best product.

57 X Q. What do you mean by pointing out the best mode of carbonization?

A. If, for instance, the carbonized incandescing conductor is to have an arch shape, the workman is left entirely in the dark as to whether he should take an ordinary piece of wood and cut it in an arch form, or whether he should take a piece of wood with the fibres running parallel and bending it into that form and holding it under constraint in a closed receiver away from the air, put it through the carbonizing process. This he would be left to find out for himself. Now, as I understand it, if he fell upon the first plan and attempted to cut the arch piece from ordinary wood and then to convert it into a carbonized conductor, all the difficulties which I before pointed out would be present, namely, the want of homogen-ity in the final structure both when heated to that temperature at which it would be useful in a lamp, the action known as arcing would be certain to take place and the conductor be destroyed and the lamp become useless; and the same remark is true if having carbonized the wood before it was reduced to form he should then attempt to cut the arch piece from the charcoal thus produced.

58 X Q. In your answer to question 11 you state that you find
the embodiment of the elements of the modern incandescent
767 lamp first described in United States patent No. 223,898 to
Thomas A. Edison. Did you mean to include in this a description of the proper method of making an efficient incandescent conductor?

A. Certainly not.

59 X Q. When was the patent to Edison, to which you have referred, applied for?

A. November 4th, 1879.

60 X Q. Do you find in the Edison patent referred to a sufficiently definite and explicit description of the process for making an incandescent conductor for an electric lamp to enable a person skilled in the art, as it stood in January, 1880, to make a practically efficient incandescent conductor for an electric lamp?

Objected to as incompetent, immaterial and irrelevant, and as not warranted by the direct examination.

A. The patent in question seems to me to give much fuller information on this point than the patent in suit. It certainly names materials that may be used for this purpose; it names processes by which they may be put in the desired form; it names a process by which they may be protected during carbonization and shows a mode of adaptation to the electrodes that lead to and from the lamp. Some information is certainly communicated in "I have discovered that even a cotton thread properly carbonized and placed in a sealed glass bulb exhausted to one-millionth of an atmosphere," &c.; also the language that "if a thread be coiled as a spiral and carbonized, or if any fibrous vegetable substance which will leave a carbon residue after being heated in a closed chamber be so coiled," &c. This language certainly points in the direction in which one must proceed, and is in that respect fuller than the patent in suit. Other quotations may be made from the specification pointing in the same direction. Thus, "If the cotton thread is liable to be distorted through carbonization it is to be coiled between a helix of 768 copper wire. The ends of the carbon or filament are secured to the platinum leading wires by plastic carbonized material and the whole placed in the carbonizing chamber." The copper is then eaten away with nitric acid, and the carbon residue is employed as an incandescent conductor in the lamp. These directions seem to me more explicit than any contained in the patent in suit.

61 X Q. Referring now to the selection of material, would it in your opinion be sufficient to refer merely to the cotton and linen thread without giving any directions as to what kind of such thread should be selected?

Objected to as incompetent, immaterial and irrelevant, and as not warranted by the direct examination.

A. It would seem to me that the direction would be far more explicit than any given in the patent in suit, and probably quite sufficient to lead to some success, inasmuch as the cotton and linen thread as usually found in the market are quite uniform in cross-section, and therefore in quantity of material contained in any cross-section, and would be likely to furnish a carbon residue of tolerable uniformity throughout its entire length. I take it for granted that if thread were used, any one skilled in the art would select a thread of suitable size when making allowance for the shrinkage in carbonizing to give him a carbon wire for a conductor suited to his purpose. Exactly what would be suited to his purpose would depend upon the conditions under which he proposed to use the lamp as respects the electro-motive force and the value of the current at his disposal. In this respect both are alike silent, both the patent in suit and the patent alluded to.

62 X Q. Is the cotton and linen thread of commerce more uniform in thickness than the paper of commerce?

Same objection as before.

769 A. I should say yes, almost of necessity from the mode of manufacture. Perhaps not in thickness, strictly speaking, but in the quantity of material present in any section. The most important reason for this opinion is that most papers which are not glazed or smooth are quite wanting in uniformity of thickness. Those which are, are made apparently uniform in thickness by being passed through heavy calender rolls so that the excess of material at any one point is condensed, and while the difference in thickness might not be apparent, the difference in quantity of car-

bonaceous residue would very likely be too great for the purpose in question.

63 X Q. Is it not a fact that the thread as found in commerce is frequently glazed with substances which would be deleterious to the carbon and filled with dyes and other substances which would unfit it for use for its purpose as much as paper is so unfitted?

Objected to as incompetent, immaterial and irrelevant, and as not warranted by the direct examination.

A. I do not think so to the same extent. The very purpose to which thread is put, to be drawn many times continuously through a fabric, almost of necessity compels the manufacturer to secure uniformity. And if it be glazed with such substances as are named in the question, the excess of such glazing or stuffing would be generally removed in the process of manufacture. I do not, however, mean to say that thread is by any means the best material, or that in modern practice one would be likely to employ it.

Adjourned to Tuesday, March 12th, at 9 a. m.

770 PRINCETON, N. J., *March* 12, 1889—9 a. m.

Present: Mr. Dyer, Mr. Curtis.

Professor CYRUS F. BRACKETT—cross-examination resumed.

By Mr. CURTIS:

64 X Q. In your answer to question 28 you say that in the old forms of lamp construction referred to in the Edison patent No. 223,898, the globe was ground to and fitted to a glass plate or closed by means of metal caps. To what prior patent or publication did you refer when you said that the globe was ground to and fitted to a glass plate?

A. In that part of my answer in which the expression ground or fitted to a glass plate was employed, I had reference to the early state of the art in which experiments were tried in an illuminating chamber consisting of the ordinary plate of the air pump with its filled glass receiver, the grinding and fitting being of precisely the same character as that of the patent in suit. I referred to the early publication in the Philosophical Transactions and the collected works of Davy coupled with the general knowledge as to the construction of air-pump receivers, and indeed also the English patents of Staite and Kosloff; the United States patent of Kosloff and the two 1878 patents of Sawyer and Man to which I have already referred, namely, 205,144 and 210,809.

65 X Q. In your answer to question 21 what is the "essential improvement in the art of incandescent lighting" to which you refer?

A. I should say primarily it consisted in the employment of an incandescent conductor of considerable length and very inconsiderable cross-section, so that currents of high potential and of small quantity can be successfully employed for producing the light.

And this general requisition would compel one constructing 771 such lamps to employ material suited to be put into such a general form, namely, if I may so express it, in the form of a wire of carbon rather than the form of a short thick block. Of course I do not now allude to the lamp chamber or to fittings, conductors, &c., merely to the active part of the apparatus.

66 X Q. How would the omission of the words "or charcoal" to which you refer in your answer to question 21 help the patentees to cover such an essential improvement as you have now specified?

A. If the term "charcoal" remained standing in the patent, so wide a range of material would be indicated that it seems to me one who should attempt to construct a lamp would be about as well off and not much better than he would have been if no material whatever had been named. The word carbon would, to my mind, indicate that an attempt was made to exclude the vaguer meaning which would be conveyed by the simple term charcoal, which has a commercial signification and means the residue after the ignition of ordinary wood, and especially when the term wood carbon is considered in connection with the hints given in the specification, it would be an indication to my mind that the patentees intended to cover some form of carbonaceous residue resulting from a structure different from that of ordinary wood.

67 X Q. In your answer to question 31 you say that some of the modern incandescent lamps have conductors which are not made of carbonized fibrous or textile material. Are you familiar with the construction of all the incandescent lamps in commercial use in this country at the present time?

A. I cannot say that I am familiar with them all. I know something of several varieties.

68 X Q. What manufacturers of incandescent lamps in this country use carbons which are not made of carbonized fibrous or textile material?

A. It is my understanding that the lamps which are made by the United States Electric Lighting Company employ a material which in the final preparation before carbonization is not 772 fibrous. It is my understanding also that the Bernstein lamp employs a material, which though fibrous in the first place, is so treated as to become at least partially not so before calcination. I think also the Vitrite and Luminoid Company.

69 X Q. What is the material used by the United States Electric Lighting Company to which you have referred?

A. I suppose it might properly come under the general class of the celluloids, which I believe is a structure obtained by dissolving wood fibre and special treatment so that its fibrous character has disappeared. It is known as tamidine.

70 X Q. Do you know whether all the lamps or only part of those made by the United States Company are made of this material?

A. I do not.

71 X Q. How largely are the Bernstein lamps and the Vitrite

and Luminoid lamps in commercial use as compared with those having conductors made of fibrous materials?

A. I am unable to give any very close estimate. I suppose, however, not so large as the lamps having the fibrous material.

72 X Q. Do you know how the carbons of the Bernstein and Vitrite and Luminoid lamps are prepared?

A. I do not know the details. From a conversation with Mr. Bernstein himself some years ago I got the general impression that in the lamp as constructed by his company silk, which may be regarded as an animal fire, was first treated with some preparation and afterwards the resulting substance was subjected to a high temperature, leaving practically a tube of carbonaceous residue which was employed as the incandescent conductor of the lamp. With reference to the preparation of the material in the Vitrite and Luminoid lamp I can give no special information.

74 X Q. In your answer to question 15, in what sense did you understand the expression "a practically useful structure for the purpose of electric illumination" to be used?

A. By the expression employed, I should understand a
773 lamp which might fairly be said to be beyond the experimental stage in which it might be able to maintain its integrity for a few hours or days as the case might be and to be such as might be offered to the public with an expectation of a life somewhat comparable with that which now obtains in the modern electric lamp. I should not consider it a practically useful lamp if it had to be re-exhausted from time to time, or if it had to receive any special care on the part of the attendant to fill it with gases not containing oxygen so as to prevent its destruction. I suppose it would be difficult to draw an exact line between a practical and a non-practical lamp.

75 X Q. What is the average lifetime of the modern incandescent lamps which you have assumed in your answer to the last question?

A. I should hardly think a lamp would be called a practically useful lamp which would not maintain its integrity at least one or two thousand hours of continuous use. I have some in my possession which perhaps were in my mind unconsciously, that have been used upwards of three thousand hours.

76 X Q. How nearly to these figures would it be necessary that the lifetime of the lamp of the patent should approach in order to make it in your opinion a practically useful structure for the purpose of electric illumination in the sense in which you understood those words to be used in your answer to question 15?

A. Assuming as the basis of the answer that the question means a lamp to be employed for ordinary illumination in our houses, I think that if such a lamp in its original cost of construction and in the care of its maintenance should consume an amount of money and time which would be greater in value than that which would procure an equal illumination by the ordinary illuminants, gas, oil, it would be ruled out of the field of competition and decided as a non-practical lamp. Further, if it were to compete with the modern improved incandescent lamps in public use, the amount of its illumination and the time during which it could be afforded, together with the cost of the lamp, must be such that it can 774 fairly come in competition. It may, however, be said that what in one period of the development of the art will be called the practical lamp in view of the principles just mentioned, would not be so at a subsequent period when better results could be secured by further practice. Now, in my answer to the question, I was influenced, doubtless, by the consideration that to be a practical lamp it should be one which could enter into competition, all things considered, with the illuminants then in use, and on that basis my judgment rested that the lamp would not be one which would properly be called a practical lamp.

77 X Q. Referring now to the time when the patent in suit was applied for, and leaving out of consideration competition with modern incandescent lamps, how many hours would the lamp have to last, in your opinion, to meet the requirements of question 15, as you understood said requirements in your answer to that question?

A. It would be very difficult to name any exact number of hours, but certainly I should say such a lamp ought to be able to maintain itself in a useful condition in daily use through several weeks.

78 X Q. How many hours per day for several weeks, and how many weeks do you mean by "several"?

A. Well, say five or six hours a day, and "several" may mean indefinitely ten or twelve.

79 X Q. Would any of the lamps described in the prior patents and publications to which you have referred, as in your opinion anticipating the claims of the patent in suit, be practically useful lamps?

A. I do not think they would.

80 X Q. Would they be practically operative lamps for any purpase?

A. No doubt they would, and no doubt the lamp shown in the patent in suit might be for some purposes for a short time.

81 X Q. In your answer to question 4 you refer to the English patent of King, No. 10919 of 1845, and quote from the specification the paragraph relating to the use of the lamp for 775 submarine lighting. What do you understand by the expression "when the apparatus is suitably sealed," used in this paragraph?

A. I understand if in case an incandescent conductor of carbon, which is liable to be consumed if oxygen be present when it is in action, were employed in the construction of a lamp, and if in such lamp a vacuum were produced, and it were hermetically closed, then such a lamp might be used in submarine lighting.

82 X Q. What do you mean by "hermetically closed"?

A. I mean the same thing as is to be understood by the language "suitably sealed." Those are the words that the patentee uses. By closing, I mean sealing.

83 X Q. Do you understand this paragraph quoted to refer to any different construction or further sealing of the lamp than is

shown in figure 2 of the patent and described in the part of the specification preceding this paragraph?

A. There is nothing in the patent by which this question can be decided, I believe. In the structure shown a platinum wire enters the top of the illuminated chamber and is sealed to the glass constituting it in the usual way, I suppose. But the connection with the electric conductor at the bottom is to be made through a copper wire which communicates with the lower end of the incandescent carbon rod. When the Torecellian vacuum is made, as is pointed out in the patent, it is not easy to see how the same sort of seal can be made at the lower extremity of the lamp, for it is manifestly impossible to fuse the glass and the copper wire together so as to effect that purpose. It appears, therefore, that some other sealing than that alluded to in the question or at least some other arrangement for closing the tube than would be employed in simply fusing the glass and lower conductor together is contemplated by the patentee.

84 X Q. Would it be practicable to use the lamp for submarine lighting with the mercurial seal such as used in barometers?

776 A. It would be entirely possible to use such a lamp. It certainly would not be a very convenient one.

85 X Q. Would it in your opinion require any invention to use a platinum wire for the lower connection and seal it into the glass in the same manner in which the upper wire is sealed into the glass?

Objected to as immaterial, irrelevant, and incompetent and not warranted by the direct examination.

A. Probably not.

86 X Q. The art of sealing platinum wires into glass so as to obtain a tight joint has been well known in the art for forty or fifty years, has it not?

Objected to as immaterial, irrelevant, and incompetent and not warranted by the direct examination.

A. It has.

87 X Q. In what classes of apparatus had such a joint between glass and platinum been used prior to 1880?

Objected to as immaterial, irrelevant, and incompetent and not warranted by the direct examination.

A. It had been used in the construction of eudiometric apparatus for the analysis of gases, in some forms of electrolytic apparatus for decomposing liquids; and somewhat more recently, in the construction of vacuum apparatus, Geissler tubes, &c., but prior to 1880.

87½ X Q. Are you familiar with the construction of Geissler tubes as practiced prior to 1880?

A. I am. I frequently constructed them myself.

88 X Q. Were the enclosing chambers of Geissler tubes made entirely of glass?

A. They were.

777 89 X Q. For what purpose were the platinum wires sealed into the glass chamber?

A. To serve as electrodes for the application of the electric current.

90 X Q. Were Geissler tubes exhausted to a high vacuum and also charged with various gases?

A. They were not in general exhausted to a high vacuum in the modern sense. They were, however, charged with various gases.

91 X Q. How was the charging with gases and the exhaustion effected; and how were the Geissler tubes sealed up so as to leave the chamber wholly of glass?

A. The chamber being suitably shaped in glass by the art of the glass-blower, and having its electrodes inserted and fused therein, and being furnished with one or more accessory tubes, the Geissler tube itself was usually, when any other gas than atmospheric air was to be employed, rinsed out by the transmission of the gas to be experimented upon for a considerable time until all the air might be presumed to be swept out of it, one of the tubes employed for that purpose closed the other connected with the air pump and the exhaustion carried on to such a degree of exhaustion as the pump was capable of producing, and in this condition the sealing lamp was applied to the tube still remaining connected with the air pump and it was closed off by the fusion of the glass.

92 X Q. The accessory tubes to which you have referred were made of glass, as I understand, sealed to the body of the chamber?

A. They were. Sometimes only one such tube was employed.

93 X Q. Were such Geissler tubes made in complicated forms and originally out of two or more separate pieces of glass?

A. They were sometimes.

94 X Q. How were these separate pieces joined together?

A. By fusion.

95 X Q. All this work, as I understand, was well known in the art prior to 1880?

778 A. It was.

96 X Q. In your answer to question 13 you say it would not be feasible to seal the glass base plate shown in the patent to the flange of the globe. Why would this not be feasible?

A. Several reasons may be given. In the construction of the Geissler tubes and such apparatus it is well known that the glass employed must be of the same kind, that is to say, having pretty rigorously the same coefficient of expansion; otherwise when sealed together changes of temperature inevitably crack the joints. The character and thickness of the tubes which are employed where such joints are to be made must in general be very considerably less than is shown in the chamber and the plate exhibited in the patent in suit. In the description and drawings shown in the patent in suit it would seem to me impracticable to effect a complete union by fusion between the chamber itself and the glass plate shown. Certainly the difficulty of the operation would be such as to render the practical manufacture of such lamps extremely difficult if not impossible.

97 X Q. These difficulties, I understand you, were well known prior to 1880?

A. I believe they were.

98 X Q. In your answer to question 14 you say it would not be feasible to seal the tubular conductors into the glass base plate of the lamp even if they were made of platinum. Are you quite sure that it would be impracticable to seal platinum tubes that would answer the purposes of the lamp described in the patent and shown in the drawing into a glass base plate so as to form a tight and durable joint?

A. In my opinion it would be wholly impracticable to seal such platinum tubes into a glass base plate such as is shown in the drawing and described in the patent, and I give as further reasons that the tubes shown are of sufficient diameter to be closed with screws which are to be turned in after the exhaustion has taken place,
which fact implies a considerable diameter in the tube which
779 would in my opinion be wholly incompatible with the integ-
rity of the structure when such platinum tubes were fused
to so thick a glass plate. Of course I do not mean to express the opinion that such a construction might not possibly be effected by exercising great care, but I do not think it could be so effected readily and frequently as to make it a practically useful mode of constructing an incandescent lamp of the type shown.

99 X Q. Please answer the question without reference to the thickness of the glass plate, assuming that the constructor is at liberty to use any thickness of plate he desires.

A. Assuming a plate sufficiently thin to allow the glass-blower to effect a union, it would, in my opinion, in such a lamp be entirely unable to endure the pressure upon it when the lamp was exhausted. It seems to me that the construction shown implies a plate of considerable thickness.

100 X Q. Then, as I understand it, you would be considerably surprised if it turned out to be a fact that ordinary glass-blowers skilled in the construction of Geissler tubes as they were made before 1880 could readily seal such platinum tubes as I have referred to into a glass base plate which would answer all the purposes of that shown in the drawing of the patent in suit?

A. I should certainly be surprised if I were shown a lamp constructed in the manner shown in the drawing in the patent in suit, that is to say, having a glass base plate sufficiently thin to adapt itself to the art of the glass-blower in sealing in the platinum tubes of sufficient size to be useful which, at the same time, was able to maintain both perfect union and so prevent leakage and sustain the atmospheric pressure which would necessarily be present in such a lamp.

101 X Q. In your answers to the last four or five questions, do you take into account the statement contained in the patent No. 205,144, referred to in the patent in suit as describing more fully the construction of the base of the lamp, that "the form of the

stopper B may be changed to that of a stopper ground into
780 the end of the globe A, as stoppers are ground into bottles"?

A. Yes; this would make no change in my answers.

102 X Q. In your answer to question No. 10 you enumerated among what you consider the essential differences between the old and unsuccessful incandescent lamps and the modern successful incandescent lamps an incandescent conductor offering a high resistance to the passage of the current so that the electric energy might be conveyed to the lamp with a high potential and small current. In this answer you had in mind, had you not, the adaptation of such lamps for use in parallel or multiple arc?

A. Not necessarily.

103 X Q. Would this be a necessary or desirable feature of a lamp to be used in large numbers in series in the same circuit?

A. Of course if many such lamps, each offering a high resistance, were placed in series, a limit would soon be reached in the resistance which they would offer so that the potential required to send a current through them would become undesirably high. But in any use of an incandescent lamp it is clear that the heat, and so the light being dependent on the resistance offered by the incandescent conductor, the resistance should be sufficiently great to fulfill its function economically. I only mean to be understood that in the modern practice, however the lamps are joined, such a resistance is sought to be obtained as will permit the temperature necessary to illumination to be maintained without the use of too large leading wires or conductors.

104 X Q. Do you know that as a matter of fact modern incandescent lamps are now largely used in series?

A. I believe they are in some cases.

105 X Q. Do you know whether in commercial practice the carbon conductors of such lamps are made of low or high resistance?

A. Lower, of course, than were used in parallel circuit.

781 106 X Q. Do you know what the resistance commonly employed is for such lamps when worked in series?

Objected to as immaterial and irrelevant because the lamp of defendant in evidence in the case is a high-resistance lamp intended for use in multiple arc.

A. I do not think any direct answer can be given to the question unless the number in the series were mentioned and the other conditions involved in the circuit.

107 X Q. Do you know that as a matter of fact modern incandescent lamps are successfully worked in series commercially, or with carbons as short and as thick as that shown in the drawing of the patent in suit?

A. I know that in the art lamps of very low resistance compared with that used by the defendant are in use in series. Exactly how small such resistance and how thick such incandescent conductors may be, I am not prepared to state.

108 X Q. Do you think it would be impracticable to construct lamps commercially with platinum conductors fused into the glass

large enough for supplying current to a carbon conductor of the dimensions shown in the drawings in the patent in suit so as to make successful and operative lamps in that way?

A. It might not be by adopting some other disposition of the plate. If the conductors were to pass through a plate as shown in the drawing and described in the specification I believe it would be.

109 X Q. Suppose they were sealed in *in* the same manner in which platinum wires were sealed in the Geissler tubes prior to 1880, would it be impracticable to construct lamps in that way?

A. It might not be.

110 X Q. Do you think it would be?

A. I think it could be done.

111 X Q. Do you think there could be any particular difficulty
in it assuming the state of knowledge that workers in glass
782 had prior to 1880 in the construction of Geissler tubes and
the other similar apparatus to which you have referred in
your previous answers?

A. Probably not, but I do not believe that lamps made with conductors so large as are implied in the question would be as long-lived as those employing the smaller conductors.

112 X Q. Do you think it would have required any invention for a person skilled in the art of making Geissler tubes and similar apparatus as the art stood prior to 1880 to have sealed such conducting wires in *in* the way indicated in my previous question?

A. It might not require invention or be difficult to seal such wires into glass in the way indicated, and I should say it would rather require skill than invention.

113 X Q. Would it have required any invention on the part of a person skilled in the art of making Geissler tubes as the art stood prior to 1880 to have used accessory glass tabes for filling and exhaustion in the manner you have described in connection with the construction of Geissler tubes instead of the tubular electrodes described in the patent in suit?

A. I should think not.

114 X Q. This was a well-known device, was it not, in such apparatus for filling and exhausting a chamber required to be hermetically sealed?

A. It was.

115 X Q. In addition to the apparatus you have referred to as constructed and well known prior to 1880, with platinum electrodes fused into the walls a chamber made entirely of glass, would not Prof. Crooks' radiometers come within this description and were they not known prior to that time?

Objected to as immaterial and irrelevant.

A. They would, and they were known prior to that time.

116 X Q. These were exhausted to a very high vacuum, were they not?

Same objection.

783 A. They were.

117 X Q. And the chambers were constructed with especial reference to maintaining such a vacuum, were they not?

Same objection.

A. They were.

Redirect examination by Mr. DYER:

115 Re-D. Q. In giving your answer to X Qs. 41 and 42 did you have particularly in mind the material as a material or its use as an incandescent conductor or both?

A. More especially the material as a material.

116 Re-D. Q. You have been asked on cross-examination as to the manufacture in America of incandescent lamps having carbons made from carbonized non-fibrous material. What do you understand the fact to be with regard to the manufacture of such lamps in England?

Objected to, unless the witness knows of his own knowledge what the fact is.

A. I believe that in England lamps are largely manufactured using carbon conductors composed of non-fibrous materials more largely than any others.

117 Re-D. Q. Referring to your answers to X Qs. 75 and 76 and thereabouts, how long do you think a carbon burner raised to a degree of heat suitable for lighting purposes would last in such a lamp construction as that described in the patent in suit?

A. My general answer is, I believe it could not be very durable. It probably would last not more than a few hours at the utmost. My reason for this opinion is that owing to the high temperature it would be extremely difficult to exhaust it so thoroughly that a residuum of air would not remain quite competent either by the yielding of its oxygen to consume it or by the collision of the 784 remaining nitrogen to destroy it, supposing a vacuum sufficiently high to be maintained. But I should think it would be extremely difficult to maintain such a vacuum, and, if not, the carbon would certainly soon be destroyed.

118 Re-D. Q. To what extent, if at all, would this opinion be modified, if such a lamp structure were attempted to be filled with nitrogen gas or other gas not containing oxygen either at atmospheric pressure or in a rarefied condition?

A. I do not believe that this change would greatly prolong the useful life of the lamp, though it might do so somewhat

119 Re-D. Q. What in your opinion would be the relative value for electric lighting purposes of the lamp described in the patent in suit and those of the prior patents of Roberts, Shepard, Konn, Kosloff and others which you have referred to as anticipating the claims of the patent in suit?

A. About the same.

120 Re-D. Q. Would there be any material difference in this re-

spect between the lamp of the patent in suit and those of the earlier patents referred to?

A. I do not think there would be.

121 Re-D. Q. You have stated on cross-examination that it was well known in the construction of Geissler tubes and other apparatus before the year 1880 that the separate glass parts of a vacuum chamber could be secured together by the fusion of the glass, and that platinum wires passing into the chamber could be sealed into the glass by the fusion of the glass upon the wires. Please state whether or not in your opinion the lamp structure described and illustrated in the patent in suit is one adapted or designed for the application of these known facts in its construction?

A. It does not appear to be designed for that mode of construction and in my opinion it is very poorly adapted to it.

Recross-examination by Mr. CURTIS:

122 Re-X Q. Why is the lamp structure just referred
85 to poorly adapted to the construction employed in the
Geissler tubes?

A. For reasons already referred to in my previous cross-examination and in my direct examination. The great extent of the chamber, the presence therein of large metallic surfaces, offer serious obstacles in the proper exhaustion of the vessel to render any sealing, however efficient, useful; but more especially, the size of the conductors shown, even though they were made of platinum, the thickness of the glass through which they pass, would be very unfavorable elements in the finished product, inasmuch as they would tend constantly to leakage for the reasons I have already pointed *at*.

123 Re-X Q. Was this all well known prior to 1880?

A. Certainly not so well appreciated prior to that time as since. It was not the practice, I believe, in the construction of Geissler tubes, and it certainly was not possible in the nature of the case to have recourse to the high temperature which is available in the construction of the lamp in order to secure the more perfect vacuum. This difficulty of securing a perfect vacuum is one which increases with the high temperature. In the modern lamp chamber, being small, the residue of air is proportionally small and the danger to the incandescent conductor is thereby diminished. These elements were certainly not so thoroughly appreciated prior to 1880 as they have since come to be.

124 Re-X Q. The facts in regard to the glass-work were fully known, were they not, prior to 1880?

A. They were.

125 Re-X Q. And the other facts to which you refer had been investigated and published by Crooks and Stearns in connection with their work on the radiometer, had they not?

A. They had.

126 Re-X Q. Have you ever made any experiments with the lamp structure shown and described in the patent in suit to de-

termine the facts upon which the opinions you have expressed are based?

786 A. I have not. My answers are rather based on the behavior of lamps of the ordinary construction in which incandescent conductors are present in a hermetically sealed glass chamber in which some manifest imperfection had come to be evident, as the overheating of one of the conductors causing an imperfect sealing. Such a lamp through the minutest possible opening speedily receives enough of air from the outside to cause its destruction, even though the injury be so slight as to escape detection otherwise.

127 Re-X Q. Have you made any experiments with incandescent lamps filled with nitrogen or other inert gas?

A. I have not. My answer touching that subject is based on the well-known fact that the Crooks phenomenon is set up in high vacua when any gas is present, namely, the particles of the gas whatever they may be, are put in a state of high activity, and on suitably devising the apparatus by the mere collision of such particles without the passage of the current in the ordinary sense pieces of metal are heated to incandescence and even to fusion, thus losing their integrity, and I infer the same thing would happen with carbon conductors.

128 Re-X Q. Are you aware of the fact that many of the present commercial incandescent lamps are made with quite low vacuum and residual atmospheres of various inert gases?

A. I believe it to be so.

129 Re-X Q. And are not such lamps as a rule fully as successful as lamps exhausted to a very high vacuum?

A. Not with conductors of the same minuteness in cross-section, I believe. When such lamps are, however, in successful operation, I believe they do not attain a very high vacuum.

130 Re-X Q. What English lamps do you believe to contain a non-fibrous carbon?

A. That usually known as the Swan lamp, I believe, which I understand is very largely manufactured in England.

787 131 Re-X Q. Do you know how the Swan carbon is made?

A. Only in general. I believe one of the actions which I have already explained in this examination is resorted to, the result of which is similar to that which is obtained in the production of parchment paper. Fibrous material treated with zinc chloride or possibly with sulphuric acid is reduced to a gelatinous form and then shaped and freed from the chemical used and finally carbonized.

132 Re-X Q. The carbon is made, is it not, by partially parchmentizing a cotton thread but still leaving sufficient coherence in the thread to maintain substantially its original shape?

A. I understand that to be the case.

Re-redirect examination by Mr. Dyer:

133 Re-re-D. Q. How far, if at all, are your opinions with regard to the practicability of the lamp structure of the patent in suit as-

sisted by your practical experience with and knowledge of pneumatic apparatus in which the same conditions are reprodued?

A. Very largely. I may say in response to this question that a common-class experiment which I have been accustomed to exhibit is the production of a form of electric light similar that shown in the Geissler tube by employing a tube which can be connected with the air pump and also by electrodes at its extremities connected with the inductorium and by putting both the pump and the inductorium in action proceeding progressively to exhaust the tube when the various Geissler phenomena show themselves. If with such an apparatus a good vacuum be obtained so that the phenomenon is well displayed and then it be closed by an exceedingly well ground and fitted stop-cock, the leakage into such a tube so readily takes place that the whole series of phenomena can be observed in the reverse order without difficulty, thus showing that the
788 air makes its way readily through the sealing employed in such apparatus which does not differ essentially from that shown in the patent.

CYRUS F. BRACKETT.

Sworn to before me—

WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

NEW YORK, *March* 21, 1889—3 p. m.

Met pursuant to adjournment.

Present: Amos Broadnax, Esq., counsel for complainant; R. N. Dyer, Esq., counsel for defendant.

The witness, Professor CYRUS F. BRACKETT, being recalled and resworn on behalf of the defendant, deposes and says as follows in answer to questions by defendant's counsel:

1 Q. Assuming that the expression fibrous or textile material used in the first and fourth claims of the patent in suit means that the material which is carbonized is both fibrous and textile, does the defendant's lamp, which you can assume is provided with a carbon made from the stalk of the bamboo, in your opinion, employ such a fibrous or textile material?

Question objected to on the ground that it is not competent or material upon any issue involved in this case.

A. I do not think it does, for the reason that if we are to consider the material both fibrous and textile whatever definition may be given to the word "textile" it is obvious that bamboo is not such a material, inasmuch as it is quite unsuited to be either spun or woven, nor is it suited to be made into paper. In no sense, therefore, would the defendant's lamp employ such a material as is indicated in the question.

789 2 Q. Please state whether or not, in your opinion, the principles of construction used in Geissler tubes as to sealing the glass parts together to form a vacuum chamber, exhausting and sealing the same by means of a glass tube and sealing platinum

into the glass for carrying an electric current into the vacuum chamber were prior to the issue on January 27, 1880, of Mr. Edison's patent No. 223,898, and prior to the publication of his work upon incandescent lamps in the "New York Herald" of December 21st, 1879, applicable to lamp structures like that of the patent in suit, or known or recognized as equivalents for the corresponding features of lamp structures like that of the patent in suit?

Same objection.

A. I do not think they were. A Geissler tube comprises a chamber of glass into two points of which at least are fused platinum electrodes for the introduction of the current into the chamber which is more or less completely exhausted. The work of exhaustion is usually accomplished by connecting the tube with a suitable exhausting apparatus, an air pump for instance, and after having formed the vacuum by means of the pump, it is hermetically sealed at the blast lamp. The exhaustion of the Geissler tube may be and is in practice carried through various stages of completeness depending on the purpose which the experimenter has in view. The phenomena occurring in the tube will vary in character, depending on the completeness of the exhaustion and the character of the residual gas contained in it. The term does not necessarily imply that the exhaustion shall be carried to that degree which we know as a high vacuum. The platinum electrodes which are fused into the glass may be very small, inasmuch as the current necessary to produce the phenomena may be of very small quantity, but is usually of high potential. The whole phenomena depending on the passage of the current through the air space or space occupied by other residual gas taking place in the gaseous 790 medium precludes the idea of the electrodes being brought in contact. They are usually separated by very considerable distances, oftentimes several feet. It appears to me, therefore, that the principles involved, namely, the minuteness of the platinum wires used for electrodes, the fact that they do not come in contact either immediately or mediately by any conducting material save a gaseous one, that the chamber does not necessarily contain a high vacuum, seem to me not to be applicable to the construction of incandescent lamps, as they are known in the art.

3 Q. Please state whether or not, in your opinion, the principles involved in the construction of the chamber forming the Geissler tube, namely, the making of it in a continuous piece of glass with the joints closed by the fusing of the glass and the using of platinum wires passing through the glass walls and sealed into them by the fusing of the glass upon the wires were, prior to the publication of Mr. Edison's invention, useful in or applicable to the construction of the lamp chambers of incandescent lamps, giving your reasons for any opinions you may express?

Same objection.

A. It does not seem to me that they were. Such incandescent lamps as were known or had been proposed prior to the work of

Edison alluded to, employed incandescent conductors requiring currents of great strength to bring them to the necessary degree of incandescence to render them luminous, and this fact is incompatible with the small conducting wires which are universally employed in Geissler tubes, for if such wires were used they would either fuse directly on the application of sufficient current or by the resistance which they offer would develop sufficient heat to cause them to rapidly expand before the glass in contact with them could be heated to the same temperature, the result of which would be that a stress between the platinum electrodes and the glass would be produced 791 sufficient to break asunder the union or fracture the glass. A necessary consequence of this would be that the chamber would not retain its exhaustion, air would be admitted, and immediately begin its destructive effect by oxidizing the incandescent conductor and it would then only be a question of time, usually a very short one, before the conductor would be completely destroyed or rendered unserviceable. And, further, an inspection of the various devices for incandescent lighting, and especially the one shown in the patent in suit, reveals the fact that it was contemplated that the life of the carbon would not continue for any great length of time and accordingly the chambers enclosing the incandescent conductor and more or less suited to maintain a vacuum or to enclose an innocuous gas were so constructed as to be readily taken apart for the purpose of renewal. The idea does not seem to have occurred to the early workers in the art of incandescent lighting to construct an apparatus such that when the carbon should fail to fulfill its function the whole could be thrown away or replaced by a new lamp. The effort seems to have been to construct what might be called a lantern with its adjustable portion which could be removed giving access to the interior for the renewal, from time to time, of the incandescent conductor. For these reasons I have given the opinion first stated. I do not think that the principles involved in the construction of the Geissler tube were at all applicable to the construction of incandescent lamps at the date mentioned.

4 Q. What would be the effect of attempting to enclose a carbon of the size of that shown in the patent in suit or of those used by the early experimenters, in a glass chamber like that used for Geissler tubes?

Some objection.

A. The effect would be, in my opinion, that if the electrodes of the Geissler tubes were not made larger than usual there would be failure to heat the conductor intended to be incandescent, and 792 so the lamp would be useless; but if we assume that the platinum electrodes entering the chamber and fused into it were of sufficient size to carry a really useful current, then an effect which I have already pointed out would take place, namely, the unequal heating between the platinum electrodes and the glass would result in its immediate fracture and so the lamp would be rendered useless.

5 Q. Why would this unequal heating take place?

Same objection.

A. The immediate effect of the current would be to heat the platinum electrodes to high temperature before the glass would have time to become equally heated and expand with it, supposing their coefficients of expansion were the same, and thus fracture would occur. But, secondly, the coefficients of expansion are not the same, and the difference becomes mischievous in proportion to the size of the platinum electrode which is fused into the glass.

6 Q. What change, if any, in your opinion, in the principle of the incandescent lamp was necessary before the Geissler tube construction of chamber could be applied to such lamps?

Same objection.

A. In my opinion, it was absolutely necessary to abandon the old lines of procedure in which the incandescent conductor was of large cross-section, and therefore required a current of great intensity to operate it, and to set out on a wholly new line, namely, to employ as the incandescent conductor an infus*a*ble material offering great resistance to the passage of the current, so that it could be heated to incandescence by a current of small intensity by employing a sufficient electro-motive force to cause the current to pass. By adopting this plan the size of the platinum electrodes could be reduced in like manner, small platinum wires could then be employed and successfully fused to the glass 793 so that the danger of fracture would be removed, and the further advantage would be offered that the enclosing chamber could be made of small size, and therefore more completely and thoroughly exhausted in the accomplishment of which the very structure of the lamp itself offers very important aid, namely, before sealing, and while the exhausting pump is in operation after a tolerably perfect vacuum has been formed, the electric current can be sent through and the whole heated, thus expanding the air and removing that which adheres to the filament and to the glass walls, and thus enable the constructor to reach what is now known as a high vacuum, which is the essential condition of long life in the lamp, and therefore of its commercial usefulness.

7 Q. Do you include such lamps as that shown in the patent in suit under the statement contained in your last answer with regard to the old lamps having conductors of large cross-section?

Same objection.

A. I do. By the expression large cross-section I mean relatively to the length of the conductor. Certainly, the one *one* there shown would come under that class.

8 Q. When was the radical change in the art made which you have referred to in your answer to question 6, which made it possible to apply to incandescent-lamp construction the construction of chamber that had been used in Geissler tubes?

Same objection.

A. The principle was announced in a publication in the "Herald" of December 21, 1879, and also in the patent granted to Thomas A. Edison dated January 27, 1880, number 223,898.

9 Q. Please state whether or not, in your opinion, the Geissler tube radiometer construction of enclosing chamber was known or recognized prior to the time of the Edison publication you
794 have referred to, as the equivalent or substitute for the structures which had been used or suggested for use as the enclosing chambers of incandescent electric lamps?

Same objection.

A. I believe it was not. I know of no publication in which it is set forth, nor do I know of any lamp construction in which it is shown prior to that date. And in my opinion, as already set forth, such a construction was wholly inapplicable to the lamps which were known before that date.

10 Q. Since the giving of your prior deposition in this case have you changed your views with regard to the application of the Geissler tube construction to incandescent electric lamp as stated by you on cross-examination?

A. No; I have not. I stated in answer to cross-question 111 of my prior deposition that I did not believe the lamps "would be as long lived as those employing the smaller conductors." At the time of giving my prior deposition I did not have the particular considerations bearing upon this special topic as fully in mind as at the present time, and consequently I did not state my views as fully as I have now done. It does not clearly appear by the general statements of my prior deposition that it was my opinion that platinum wires of sufficient size to carry the current to a carbon conductor of the dimensions shown in the patent in suit could probably be successfully sealed into glass by the fusion of the glass, but that in the use of lamps made in that way the lamps would not have a useful length of life, since the rigid sealing would be quickly broken and permit oxygen to enter the lamp chamber and destroy the carbon. That was my opinion then, as it is now after full consideration, but possibly it is not clearly expressed by my prior deposition. If it should be considered that there is any conflict between my two depositions on this topic, I, of course, desire that my present deposition, which is given with a fuller con-
795 sideration of the special topic and a fuller presentation of my views, should be taken as my opinion.

Without intending to waive his objection as above noted, complainant's counsel proceeds to cross-examine the witness.

10 X Q. Are you aware of the fact that previous to January 1st, 1880, the manufacture and sale of paper from bamboo was a well-known article of commerce?

A. I believe that paper had been manufactured from the leaves of the bamboo, but I am not aware that the fibre and especially that portion of the stalk which has since been employed in the construction of incandescent lamps was so used. I do not think it has been.

11 X Q. Do you know that previous to the date mentioned in my last question, paper had been made and sold as an article of commerce, from what is known as cane or bamboo stalks, leaving out altogether the manufacture of paper from leaves of the stalk?

A. I am not aware of that fact if it be such. I very much doubt if from that selected portion of the bamboo stalk which is employed in the construction of incandescent lamps by Mr. Edison, paper has at any time been manufactured. It may be true that from some portions, from material in such respects resembling it such paper has been manufactured and has been on sale. I will venture the opinion, however, that if one were to take the bundles of prepared bamboo as they go to the lamp factory as his entire stock he would be quite unsuccessful in the manufacture of paper therefrom.

12 X Q. What portion of the stalk of the bamboo does the Edison Electric Light Company make their incandescent conductors?

A. As I understand it, the portions selected are not taken indiscriminately from the bundles of woody fibre which make up the
entire stalk of the plant, but only the firmest and most com-
796 pact portion which lies very close to the exterior after
removing the silicious covering with which that plant is invested.

13 X Q. Generally speaking, do you mean by your last answer that defendants make their illuminating conductors of the straightest and best part of the fibre embraced or making part of the bamboo stalk?

A. While it is true that the portions are selected in which the fibre runs parallel with each other, which I suppose is the condition of fibre alluded in the expression "straightest," yet I do not understand that this is the only quality, but it is quite as important that that portion be taken in which the fibres are most closely compacted together and this is precisely the part which I think would be ill suited to the manufacture of paper.

CYRUS F. BRACKETT.

Sworn to before me,

WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

PHILADELPHIA, PA., *March 13th*, 1889.

Met pursuant to adjournment and upon agreement of counsel.

Present: S. A. Duncan, Esq., for complainant, and R. N. Dyer, Esq., and W. K. Griffin, Esq., for defendant.

Counsel for defendant offer in evidence as exhibits on behalf of defendant the following patents and publications referred to by the witness Prof. C. F. Brackett, and the same are marked as follows:

(1) Pages 32 to 38 inclusive of the Philosophical Transactions of the Royal Society of London, for the year 1809, vol. 9, part I, published in London, Eng., in the year 1809.

(2) Pages 363 to 374 inclusive of the Philosophical Transactions

of the Royal Society of London, for the year 1815, vol. 15,
797 part I, published at London, Eng., in the year 1815.

(3) Pages 21, 26 & 27 of the Philosophical Transactions of the Royal Society of London, vol. 20, sec. 2, published at London, Eng., in the year 1820.

(4) Pages 425 to 439, inclusive, of the Philosophical Transactions of the Royal Society of London, for the year 1821, part I, vol. 21, published at London, Eng., in the year 1821.

(5) Philosophical Transactions of the Royal Society of London, part I, vol. 39, published at London, Eng., in the year 1839, commencing at page 89, the same being a letter addressed to Michael Faraday, Esq., by J. Frederick Daniell, Esq., entitled, "Fifth letter on voltaic combinations, with some account of the effects of a large constant battery."

(6) A paper by the Rev. William Ritchie on experimental researches in voltaic electricity and electro-magnetism, commencing at page 292, vol. 32, part I, of the Philosophical Transactions of the Royal Society of London, for the year 1832, published at London, Eng., in the year 1832.

The foregoing six papers are marked respectively "Defendant's Exhibit Philosophical Transactions, paper No. 1, paper No. 2, paper No. 3, paper No. 4, paper No. 5, and paper No. 6."

(7) Collected works of Sir Humphrey Davy, vol. 2, pages 211 to 213 inclusive, published at London, Eng., in the year 1839.

(8) Collected works of Sir Humphrey Davy, vol. 2, pages 216 to 220, published at London, Eng., in the year 1839.

(9) Collected works of Sir Humphrey Davy, vol. 4, pages 109 to 112, 221, 231 and 232, published at London, Eng., in the year 1840.

(10) Collected works of Sir Humphrey Davy, vol. 5, pages 172 and 173, and pages 220 to 222, and 275 and 285, published at London, Eng., in the year 1840.

The four foregoing extracts are marked in evidence "Defendant's Exhibit Extracts from Collected Works of Sir Humphrey Davy."

798 (11) A paper entitled "Overheated steam applied to the carbonizing of wood," published at page 270, vol. 16, of the American Journal of Science and Arts, published at New York, in the year 1853, and the same is marked, "Defendant's Exhibit Violette Paper."

(12) Paper by M. Sidot, published at page 605, vol. 70, of the Comptes Rendus, published at Paris in the year 1870, and a translation into English of the same paper, the same being marked "Defendant's Exhibit Sidot's Paper."

(13) Watts' Dictionary of Chemistry, vol 1, pages 759 and 760, published at London, Eng., in the year 1863.

(14) Watts' Dictionary of Chemistry, second supplement, page 255, published at London, Eng., in the year 1875.

The two foregoing papers are marked in evidence as "Defendant's Exhibit Extracts from Watts' Dictionary of Chemistry."

(15) Blue Book copy of English patent No. 8644, A. D. 1840, to

Pinkus, and the same is marked "Defendant's Exhibit Pinkus English Patent No. 8644 of 1840."

(16) Blue Book copy of English patent No. 9053, A. D. 1841, to De Moleyns, and the same is marked "Defendant's Exhibit De Moleyn's English Patent No. 9053 of 1841."

(17) Blue Book copy of English patent No. 10919, A. D. 1845, to King, and the same is marked "Defendant's Exhibit King's English Patent No. 10919 of 1845."

(18) Blue Book copy of English patent No. 11076, A. D. 1846, to Greener & Staite, and the same is marked "Defendant's Exhibit Greener & Staite's English Patent No. 11076 of 1846."

(19) Blue Book copy of English patent No. 12212, A. D. 1848, to Staite, and the same is marked "Defendant's Exhibit Staite's English Patent No. 12212 of 1848."

(20) Blue Book copy of English patent No. 13302, A. D.
799 1850, to Shepard, and the same is marked "Defendant's Ex-
hibit Shepard's English Patent No. 13302 of 1850."

(21) Blue Book copy of English patent No. 212, A. D. 1852, to Slater & Watson, and the same is marked "Defendant's Exhibit Slater & Watson's English Patent No. 212 of 1852."

(22) Blue Book copy of English patent No. 14198, A. D. 1852, to Roberts, and the same is marked "Defendant's Exhibit Roberts' English Patent No. 14198 of 1852."

(23) Blue Book copy of English patent No. 119, A. D. 1853, to Binks, and the same is marked "Defendant's Exhibit Binks' English Patent No. 119 of 1853."

(24) Blue Book copy of English patent No. 2547, A. D. 1856, to Way, and the same is marked "Defendant's Exhibit Way's English Patent No. 2547 of 1856."

(25) Blue Book copy of English patent No. 588, A. D. 1857, to Harrison, and the same is marked "Defendant's Exhibit Harrison's English Patent No. 588 of 1857."

(26) Blue Book copy of English patent No. 3164, A. D. 1857, to Burleigh & Danchell, and the same is marked "Defendant's Exhibit Burleigh & Danchell's English Patent No. 3164 of 1857."

(27) Blue Book copy of English patent No. 2841, A. D. 1857, to Way, and the same is marked "Defendant's Exhibit Way's English Patent No. 2841 of 1857."

(28) Blue Book copy of English patent No. 3809, A. D. 1872, to Konn, and the same is marked "Defendant's Exhibit Konn's English Patent No. 3809 of 1872."

(29) Blue Book copy of English patent No. 91, A. D. 1873, to Konn, and the same is marked "Defendant's Exhibit Konn's English Patent No. 91 of 1873."

(30) Blue Book copy of English patent No. 441, A. D. 1875, to Kosloff, and the same is marked "Defendant's Exhibit Kosloff's English Patent No. 441 of 1875."

(31) Blue Book copy of English patent No. 970, A. D.
800 1875, to Jensen (Konn), and the same is marked "Defend-
ant's Exhibit Jensen's (Konn's) English Patent No. 970 of
1875."

(32) Blue Book copy of English patent No. 4805 of 1876, to Werdermann, and the same is marked "Defendant's Exhibit Werdermann's English Patent No. 4805 of 1876."

(33) Blue Book copy of English patent No. 4905, A. D. 1876, and the same is marked "Defendant's Exhibit English Patent No. 4905 of 1876."

(34) Specification and drawing of United States patent to Gardiner & Blossom, No. 20706, dated June 29, 1858, and the same is marked "Defendant's Exhibit Gardiner & Blossom's Patent of June 29, 1858."

(35) Specification and drawing of United States patent of Kosloff, No. 166,877, dated August 17, 1875, and the same is marked "Defendant's Exhibit Kosloff's Patent of August 17, 1875."

(36) Specification and drawing of United States patent of Woodward, No. 181,613, dated August 29, 1876, and the same is marked "Defendant's Exhibit Woodward's Patent of August 29, 1876."

(37) Specification of French patent to Le Molt, dated January 31, 1849, and the same is marked "Defendant's Exhibit Le Molt's Patent of 1849."

(38) Mechanics' Magazine, vol. 44, pages 312 to 316 and page 348 inclusive, published at London, Eng., in the year 1846, and the same is marked "Defendant's Exhibit Extracts from Mechanics' Magazine of 1846."

(39) Journal of the Society of Arts, London, 1872–'3, vol. 21, page 779, published at London, Eng., in the year 1873, and the same is marked "Defendant's Exhibit Published Description of Ladiguin's Electric Light."

It is stipulated and agreed that the copies of publications just offered in evidence may be used with the same force and effect as the original publications, subject to the correction, at any time before the closing of the proofs, of any errors that may be found therein and the addition of any further extracts from said publications that complainant's counsel may desire to add thereto.

801 Complainant's counsel admits that the said publications were published at the respective dates above mentioned, reserving the right, however, to withdraw this admission at any time before the closing of the proofs upon allowing defendant a reasonable time for making proof in regard to the time of such publication.

Counsel for defendant states that he has been unable as yet to obtain a copy of the French patent of Gaudoin, set up in the answer, but expects daily to receive a full copy of such patent by mail from France, and he requests counsel for complainant to stipulate that such copy may be offered in evidence when received even if defendant's time for taking testimony has then expired. The patent will be offered to show a description of the manufacture of carbon pencils for arc lights and other uses by first cutting sticks of wood into the shape and size desired for use and then carbonizing such sticks.

Complainant's counsel states in response to the above request that he thinks the matter may more properly be considered when defendant's counsel has received the paper to which reference is made.

Defendant's counsel states that the foregoing Blue Book copies of English patents and printed Patent Office copies of United States patents are offered in evidence in lieu of certified copies of such patents in accordance with the stipulation between counsel heretofore made and entered upon the record of this case.

The witness, Professor GEORGE F. BARKER, a witness produced on behalf of defendant, being duly affirmed and interrogated by counsel for defendant, deposes and says as follows:

1 Q. What is your name, age, residence and occupation?

A. George F. Barker; age, 53; residence, Philadelphia. I am professor of physics in the University of Pennsylvania.

802 2 Q. What knowledge have you of the science of electricity, and what experience have you had in the use of electrical instruments and apparatus, more particularly the apparatus used for electric lighting?

A. I have been a professor of physics and of chemistry for 25 years or more, and during that time I have had occasion to inform myself with regard to the science of electricity, not only for the purpose of my own experiments, but also for the purpose of teaching this subject to my classes. I have always had at my command a sufficient supply of electrical apparatus for purposes of experiment and of demonstration, and have endeavored to keep myself informed of the progress of electrical science, not only in its theoretical but also in its practical directions. I have followed the progress of electric lighting, especially have made myself more or less familar with the various forms of apparatus required for the generation, distribution and utilization of electricity, for purposes of lighting and the transmission of power.

3 Q. How extensive was your knowledge of and experience with air pumps and other pneumatic apparatus, prior to 1878?

A. Before going to college I was employed for five years in the manufacture of philosophical instruments and apparatus, and of course at that time had an opportunity to become familiar with the construction of air pumps and similar devices for producing a vacuum. Subsequently in the cabinets of apparatus which have been in my charge at the various institutions where I have acted as professor I have been in possession of and have used for instruction and investigation various forms of air pumps both of the older and of the newer kind; the latter being of both the Geissler and the Sprengel form.

4 Q. How extensive has been your experience in the comparison of patents for inventions?

A. I have been frequently called on, during the last fifteen or twenty years, to act as expert in patent causes in matters involving questions of invention and the scope of patents. I have testified in cases involving the facts and principles of both chemical and physical science, and particularly in those which concern

803 the production and distribution of electricity and electric lighting.

5 Q. Are you familiar with the patent in suit?

A. I have read the said patent and believe I am reasonably familiar with it.

6 Q. Have you examined the various patents and publications which have been offered in evidence on behalf of the defendant?

A. I have.

7 Q. Please state whether or not you agree with the witness Professor Cyrus F. Brackett, who has already testified as an expert for defendant, in the statements made by him in answer to question 4 as to the state of the art prior to the year 1878, bearing upon the invention of the patent in suit.

A. I have read the answer referred to in the deposition of Professor Brackett in this case, and I agree with him entirely as to the state of the art prior to 1878, so far as concerns the invention which is the object of the patent in suit. I might state in addition, that the use of carbonized fibrous material for electric lighting purposes has been familiar to me ever since I had any knowledge of the subject of electric lighting. As early as 1853 or '54 I learned from my reading that the pencils which were used for the production of the electric light were made of charcoal, and preferably of boxwood charcoal. Accordingly, following directions which I remember to have read, I produced some of the said pencils by sawing pieces of boxwood into the shape of square rods, placing these in a crucible which was afterward filled with sand and heated to the temperature of complete carbonization. After cooling I found that the said carbon pencils were good conductors of electricity, and I used them for the purpose of producing electric light by incandescence; this incandescence being produced at the points of contact of the said pencils, the battery employed not having sufficient tension to allow of their being separated for the production of an arc.

804 8 Q. In making these charcoal pencils by first cutting boxwood to the shape and size desired and then carbonizing it, do you understand that you were making use of a method well known in the art for the production of these pencils at that time?

A. I considered at the time that I was simply making use of a well-known method for the production of these pencils, that I was following simply an obvious process for that construction and that there was no originality in my thus making them. This, I might add, is one of the methods described for making these pencils in the English patent of Slater and Watson, No. 212 of 1852.

9 Q. Do you agree with Professor Brackett in the conclusion reached by him in answer to question 5, that in view of the state of the art there is no feature of novelty presented by the apparatus described and illustrated in the patent in suit?

A. I do. In the art of electric lighting prior to 1878 two well-known forms of producing the light were employed. In one of these, known as the arc light, the current passed through an intervening space of air from one electrode to the other. In the other the conductor was continuous, but was of so high resistance that the current heated it up to a temperature at which it emitted light;

and this light was, therefore, called an incandescent light. Evidently in lighting by incandescence it is desirable that the material employed should be infusible, so as to withstand as high a temperature as possible; and inasmuch as the amount of heat developed is proportional to the resistance of this conductor, it is desirable also that this resistance should be high. These conditions point out carbon as the substance most suitable to form the incandescing conductor. It is practically infusible and it has a very high resistance. The defect of carbon, however, for purposes of incandescent lighting lies in the fact that it is readily combustible at the high temperature required. Hence we find in the state of the art two directions along which inventors have moved in the production of incondescent lighting. The one set of inventors relying upon the advantages possessed by carbon, have sought to overcome the 805 difficulty resulting from its combustibility by enclosing it in globes of glass, which have either been exhausted of air or in which the air has been replaced by gases containing no oxygen, and which, therefore, do not support the cumbustion of the carbon. The other set of inventors have sought to replace the carbon by some other material as infusible as possible; and have for this purpose employed platinum or iridium or an alloy of these two metals, enclosing the said conductor in a globe, simply for the purposes of protection.

Adjourned to Thursday, March 14th, 1889.

PHILADELPHIA, *March 14th*, 1889.

Met pursuant to adjournment.

Present: Same counsel for defendant, and L. E. Curtis, Esq., for complainant.

The witness continues in answer to the last question:

Experiments had been made by Davy and others very early in the history of the art with both the arc and incandescent lights *in vacuo* as well as in the air. The apparatus which was used for this purpose was some form of ordinary air-pump receiver, either bell-shaped (and resting upon the plate of the air pump) or egg-shaped and closed by suitable taps at its extremities. Subsequently the form of the glass enclosing vessel was somewhat modified, and assumed various shapes more or less spherical in form in some part of it. This enclosing vessel being called in general the globe. I entirely agree with Prof. Brackett in regard to the state of the art concerning the construction and use of the apparatus employed before 1878 for the production and maintenance of the vacuum by means of the air pump and receivers of various forms at- 806 tached variously thereto. I entirely agree with him that it was a common practice before that date to use receivers of various sizes and shaped in many cases like a long and narrow bell jar, the said receivers having separate plates of glass or metal, ground to fit their open ends. The said plates were perforated and had attached thereto some device by which the exhaustion could be effected. In these forms of apparatus I believe it was found impossible to obtain a vacuum without placing between the ground surface of the glass bell jar or globe and the ground surface of the plate some kind of unctuous substance such as tallow, beeswax or cerate. Such a device essentially it seems to me, is the form of lamp which is described in the patent in suit. It consists substantially of an elongated bell jar which is called the globe and which is ground at its lower edge, and of a plate of glass having perforations through which it may be exhausted (or the air in it may be replaced by some other gas) and through which also the conducting wires pass. In the bell jar or globe of the Sawyer-Man patent, the bell jar or globe has, it will be observed, a flange around its lower edge for the purpose of increasing the thickness of the glass at that point, and so the thickness of the ground surface there; this device being also well known in the art, and having been used upon the lower edge of glass receivers used with the air pump long prior to 1878.

I also find described in the patent in suit the use of carbon from vegetable, fibrous or textile materials, as the material of the incandescing conductor, as contradistinguished from the use of mineral or gas carbon for the same purpose. I find in the state of the art before the date of the patent in suit the use of both mineral carbon and of carbon from vegetable fibrous material as the incandescing conductor of an electric lamp. I find further that this carbonized fibrous material was used in the said incandescent lamps, or was described for such use, either in the form of straight pencils or in the form of arch or equivalent shapes.

807 Moreover, I find various devices for electric lamps, both arc and incandescent, shown and described in the various publications and patents which have been put in evidence herein and to which Professor Brackett has referred at length in his deposition. It seems to me that these devices are a natural outgrowth of the scientific principles and experiments already referred to, and I entirely agree with Professor Brackett that in view of the state of the art thus set forth, the apparatus shown and described in the patent in suit presents no feature of novelty.

I agree also with Professor Brackett in the opinion that the patentees of the patent in suit made no progress in the art of electric lighting as this art was known at the time of their invention, and that, therefore, the device which they produced and which is set forth in the said patent presents no features of novelty, and is essentially similar to devices which had been before employed for a similar purpose.

10 Q. Professor Brackett has expressed the opinion that in such a lamp construction as that shown in the patent in suit a metal plate would be the full equivalent of the glass plate *g* of the patent. Please state whether or not you agree with him in this opinion, giving your reasons.

A. I agree with him entirely in this opinion. The function of the plate referred to is simply to close the mouth of the lamp chamber. The lower end of this lamp chamber is ground flat, and the plate is also ground flat, and the cementing material is placed between the two ground surfaces for the purpose of insuring that hermetical sealing which is indispensable to the preservation of the incandescent conductor. I do not see that any object is secured by making the said plate of glass which would not equally well be secured by making it of metal. As I have already pointed out, this device itself is only a substantial copy of the early forms of receivers and air-pump plates in use twenty years ago or more. The patent in suit claims as the advantages of making the wall forming the chamber of the lamp wholly of glass, that all danger of 808 oxidation, leakage or short circuiting is avoided. But it seems to me that an air-tight joint could be quite as well secured with a metal plate, especially if as is the case with the device of the patent, fir balsam, or some similar cement, be placed between the ground edges of the lamp chamber and the plate upon which it rests. I do not understand how the oxidation of the metal plate when used to close the lamp chamber can be a danger, especially in view of the fact that in a previous patent of the same inventor's a piece of sodium, one of the most oxidizable of metals, was introduced into the lamp chamber to remove any oxygen which might possibly gain admission to it. It seems to me that, so far as the oxidation of the carbon conductor is concerned, it will be greater with the glass plate than with the metal one, since by supposition, if the metal one were oxidized, the oxygen necessary to this operation would be oxygen contained in a lamp chamber, and which would be prejudicial to the carbon conductor unless removed by combining with the metal plate. It seems to me further that no advantage of preventing short circuiting is material in this case, since there would seem not to be the least difficulty in properly insulating the conductors, even with a plate made of metal. Moreover, the transparency of the glass does not appear to be involved in this case.

11 Q. Please state what, in your opinion, are the defects, if any, in the lamp structure of the patent in suit, and state whether or not the same criticism can be made of the lamp structures shown by the prior patents and publications.

A. The defects of the lamp structures of the patent in suit seem to me to be many and obvious. In the first place, the shape and size of the lamp chamber are awkward and cumbrous, rendering it the more liable to accident. The glass is made of considerable thickness, and so is liable to fracture from changes of temperature when in use. Again, it does not consist of glass united con- 809 tinuously and in one piece, and the two parts being ground together upon flat surfaces, cannot be maintained air-tight for any length of time, even if some plastic material be interposed between the surfaces. Moreover, the conductors passing into the lamp are made of a metal highly expansible by heat, and are of large size, so that, by the necessary changes of temperature to which the lamp is subjected, the differential expansion between the glass plate and the conductors which pass through it, sooner or later results in serious leakage at these points. For these reasons it seems to me that it would be quite impossible to maintain even a moderate vacuum in such a lamp as that which is described in the patent in suit, and therefore all the more would it be impossible to maintain the much higher vacuum which experience has shown to be necessary in order to maintain the integrity of the carbon conductor for any length of time. The defects now referred to do not seem to me to be lessened by the employment of nitrogen or some other inert gas in the lamp chamber instead of a vacuum.

In this case, as experiment has shown, the amount of current necessary to maintain the conductor at the high incandescence required in such lamps is very greatly increased and the lamp is thereby rendered much less efficient than it would be if a vacuum were made in it. Again, the presence of a gas at atmospheric pressure in the lamp chamber, even when this gas is inert, has been shown to seriously injure the carbon conductor, and ultimately to destroy it, in consequence, as it is supposed, of the rapid abrasion of this conductor by the action of the gas molecules upon it. Even supposing that the inert gas were contained in the lamp chamber under the ordinary atmospheric pressure, and without rarefaction, it would, in my judgment, be extremely difficult to maintain the purity of the atmosphere within the lamp owing to the facility and rapidity with which gases diffuse into each other; the oxygen of the air under these circumstances being thus able to penetrate into the lamp chamber, thus oxidizing and destroying the carbon conductor. Another defect
810 which seems to me to exist in the lamp of the patent in suit consists in the size of the incandescent conductor. The resistance of a conductor is the greater the longer this conductor and the smaller its cross-section. To judge from the drawings of the said patent, this carbon conductor would have a very low resistance, probably not more than from one-half an ohm to an ohm. Such a low resistance as this, it is quite evident, would be fatal to the use of this lamp upon a multiple-arc circuit; since the size of the conductor required to convey the energy necessary to maintain such lamps in operation would necessarily be enormous. Even if they were used in a series circuit (an arrangement extremely undesirable and impracticable for general house illumination), the defects of the lamp, owing to the large size of the carbon conductor, would be still most serious. Not only would the amount of current necessary to maintain these conductors at the necessary incandescence be very great, owing to their large size, but their conductivity for heat would be very great, and so also would be that of the clamps necessary to maintain good contact with the carbon. A very material fraction of the energy thus expended upon the lamp would be conducted away and wasted uselessly as heat; and this without adding in any way to the production of light. This excessive production of heat in the lamp of the patent in suit seems to have been conceded by the patentees, who attempted to obviate its evil effects upon the lamp itself by placing the carbon conductor at the upper extremity of a long bell-shaped receiver or globe as far away as possible from the base, and, therefore, from the cementing ma-

terial which united the lamp chamber to the base, so as to reduce the liability to fusion of this material and the consequent leakage of the apparatus. By placing the carbon conductor at as great a distance as possible from the lamp base, the danger of leakage around the large-sized, metallic conductor at the points where they passed through the glass was diminished.

Even though the integrity of the lamp should be pre-
811 served by these devices, and also by making the conductors
leading up from the base of the lamp to the incandescing
conductor of a curved or zigzag form, whereby the radiating surface is very largely increased, yet the fact remains that so large a quantity of useless heat was produced in these lamps that these devices were necessary in order to protect them. In other words, beside the energy which is utilized as light in these lamps, there is another amount of energy which in my judgment may amount to nearly or quite as much more, which is expended uselessly in the lamp, and which not only produces no light but which requires the use of special and complex devices to prevent it from producing serious injury to the lamp structure.

The defects which have now been stated with regard to the lamp of the patent in suit are, I believe, all of them old defects, which are common to the lamps already referred to in the state of the art, as shown in prior patents and publications. Thus the lamps of Shepard, Roberts, Konn & Kosloff were similar, apparently, in size and shape to the lamp of the complainant's patent, the glass was made of considerable thickness, and the lamp chamber was attached to a plate of glass or metal, by some suitable cementing material. Moreover, the conductors for carrying the currents into the said lamps were also of large size and the carbon conductors themselves were of low resistance. I do not see, therefore, that the lamp of the patent in suit exhibits any advance in these respects over other incandescent lamps, shown and described in patents and publications long prior to the date of the application for the said patent, and prior to the year 1878.

12 Q. Please state whether or not in your opinion the lamp described and shown in the patent in suit would be a practically useful lamp, giving your reasons for any opinion that you may express.

A. In my last answer I have pointed out the defects which I conceive to exist in the lamp of the patent in suit, and have compared
these defects with those which existed in other lamps already
812 known and described in the art before 1878. This compari-
son seems to me to show that the lamp of the patent in suit
had the same defects of material and construction which were found in these early lamps. So far as I know, none of these lamps were ever put into practical use; and the reason for this is, as it seems to me, because of the defects which I have already pointed out. Inasmuch, therefore, as the lamp of the patent in suit seems to me to possess serious defects, and inasmuch as in my judgment these defects are the same in kind as those which prevented the earlier lamps referred to from coming into use, I think I am justified in the opinion

that this lamp of the complainant would not be a practically useful lamp.

13 Q. You have stated that the patent in suit discloses no advance in the art over what was well known prior to 1878. Please state what in your opinion was the advance in the art which marked the departure from the old and unsuccessful lamps toward the modern and successful incandescent lamp, and where you first find set forth the conditions upon which that departure was based?

A. To be successful, as it seems to me, an incandescent lamp must possess certain well-defined characteristics. In the first place, the carbon conductor must be of high resistance, so that the energy transmitted to it may contain the maximum of electro-motive force and the minimum of current; so that in this way the main conductors required to supply this energy to the lamp may be made as small as possible. The lamp should be capable of successful use in multiple arc upon the circuit, this being the only system of arrangement which is practicable for interior lighting. The carbon conductor should be united to wires of the minimum size, acting as conductors of the current into the lamp. Two advantages result from this arrangement; first, the expense of the conducting wires is reduced; and second, the lamp wires may be made of a metal, such as platinum, which has the same coefficient of expansion as
813 glass, and therefore is not liable to break away from the glass where it is sealed into it owing to changes in temperature. Moreover, the leading-in wires should be sealed into the glass by fusion of the glass itself. The carbon conductor should be inclosed in a globe of reasonable size and so thin that it may be sealed to the stem carrying the carbon conductor, also by fusion of the glass; and the globe should be thoroughly exhausted. It was the production of such a lamp, as I understand it, which constituted the true advance in the art which is characteristic of modern incandescent lighting. I find a description of such a lamp set forth for the first time in United States patent No. 223,898, issued to Thomas A. Edison, Jan. 27th, 1880.

14 Q. Referring now to the first claim of the patent in suit, state whether or not in your opinion there is any novel and useful invention described therein, giving your reasons?

A. The thing which seems to me to be the object of the first claim of the patent in suit is an incandescing conductor for an electric lamp made of a certain material, to wit, carbonized fibrous or textile material, and being of a particular form, to wit, of an arch or horseshoe shape. With reference to the expression "carbonized fibrous or textile material," I find that the specification speaks of "an incandescing conductor of carbon made from a vegetable fibrous material, in contradistinction to a similar conductor made from mineral or gas carbon." It also says, "in the practice of our invention we have made use of carbonized paper, and also wood carbon."

I do not, therefore, gather from the patent itself any information in regard to which of two possible constructions is intended. If the terms "fibrous or textile" are to be regarded as equivalent terms, then the word "textile" would seem to me to limit the term

"fibrous," so as to require the conductor to be made of a material which is textile as well as fibrous. If this construction be assumed (and it seems to me entirely reasonable) then in my opinion this would limit the material employed to carbonized paper, since this is the only material mentioned in the specification which
814 may be called textile even approximately; the other substance mentioned, to wit, wood carbon, certainly not being a textile material. Under this construction there appears to me to be no novelty in such a conductor, since carbonized textile material was already old in the art before 1878, and there would appear to me to be no novelty, in view of the state of the art at the time, in putting such carbonized textile material into a lamp. If, however, the expression "textile or fibrous" is to be regarded as an alternative expression, so that the said incandescent conductor may be either textile or fibrous, then it seems to me that, since carbonized fibrous material was already well known in the art in 1878 and had already been used as the incandescing conductor of an electric lamp, there is no novelty in again using it for the same purpose, as under this construction of the first claim would be the case.

With reference to the form of the carbon conductor, the references in evidence herein show not only the arch or horseshoe shape to be old in conductors for incandescent lamps, but they also show the use of carbon in the arch form in these lamps. Moreover, it seems evident to me that the shape of the conductor has necessarily nothing to do with the material of which it is made, the two things being entirely independent of each other. I cannot, therefore, see that, inasmuch as the form of the conductor is old both in metal and in carbon, and inasmuch as the material used for the conductor (that is the particular kind of carbon) is also old, and inasmuch as the form of the conductor is independent of the material of which it is made, there is any novel and useful invention accomplished by taking the old material and giving it a form which had been used for the same purpose, not only in metal, but also in carbon derived from other sources; in short in doing the thing which I understand to be the object of the first claim.

15 Q. Assuming that defendant's lamp is provided with an incandescing conductor made from carbonized bamboo, does such lamp in your opinion embody the invention set forth in the first
815 claim of the patent in suit, assuming that the proper construction of said claim is the one first stated by you in your last answer?

A. In my opinion it does not. Bamboo is not a material properly called textile, as I understand it, and I have never heard of its being used as such for textile purposes. Nor have I ever heard of its being treated successfully so as to convert it into a form in which it is separated into fibres capable of being used in the manufacture of paper or any textile fabric.

Adjourned to March 15th, 1889, at 10 a. m.

PHILADELPHIA, *March 15th*, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer, Esq., for defendant, and L. E. Curtis, Esq., for complainant.

16 Q. Referring now to the second claim of the patent in suit, state whether or not in your opinion there is any novel and useful invention described therein, giving your reasons.

A. The second claim appears to me to be a combination claim. The elements of the combination are: first, "an incandescent conductor of carbonized fibrous material," and second, "a transparent hermetically sealed chamber in which the conductor is enclosed." The claim also speaks of an electric circuit in which the lamp is included and of which it forms a part; and, since this arrangement is necessarily true of all such electric lamps, it seems to me that these words are simply explanatory. This claim seems to me to differ from the first claim in respect to the material of which the incandescing conductor is made; the second claim requiring this conductor to be made of carbonized fibrous material while 816 the first claim requires it to be made of carbonized fibrous or textile material. In this respect, therefore, the second claim seems to me to be broader than the first. The second claim also differs from the first claim in the fact that nothing is said in it of the shape of the carbon conductor, and further in the fact that the said second claim requires the carbon conductor to be enclosed in a transparent hermetically sealed chamber: about which chamber nothing whatever is said in the first claim.

Two conditions appear to me to be possible in considering this claim. In the first place, if it be considered that such a combination between such an incandescent conductor and such a transparent hermetically sealed chamber is not a valid combination, then it seems to me that the fact abundantly established by the numerous references to patents and publications which are in evidence herein that incandescent lamps had been shown and described prior to 1878, which lamps consisted of a hermetically sealed chamber of glass and of an incandescent conductor of metal or of mineral carbon, would deprive the claim of all novelty; since it was well known in the art at the time that various metals, mineral carbon, wood carbon and other forms of carbon might all be used for producing electrical incandescence.

If, however, the combination of the second claim be regarded as a valid and operative combination, then it seems to me that we have described in the patents of De Moleyns, of Greener and Staite, of Shepard, of Roberts, and in the publication of Ladyguine, incandescing electric lamps consisting of a transparent hermetically sealed chamber enclosing the conductor made of carbonized fibrous material. Moreover, the said lamps are intended to be included in, and to form part of an electric circuit, as is true of the lamp referred to in the claim. It seems to me, therefore, that there is no novel and useful invention described in the second claim of the patent in suit; and I agree in this respect with the opinion which Professor Brackett has expressed in his deposition already given in this case.

817 17 Q. Referring now to the fourth claim of the patent in suit, state whether or not, in your opinion, there is any novel and useful invention described therein, giving your reasons?

A. The fourth claim of the patent in suit is also a combination claim, the elements of the combination being first, a glass hermetically sealed chamber, containing no carbon-consuming gas; second, an electric conductor hermetically sealed into the glass wall of the said chamber; and, third, an illuminating conductor made of carbonized fibrous or textile material and having the form of an arch or loop. Referring to the specification, I find that the patent contemplates as the first element of the said fourth claim a glass lamp chamber having a glass bottom plate secured by clamps and sealed by cement to the bottom of the said lamp chamber, the space within the said chamber being exhausted of air, and either left in this exhausted state or subsequently filled with a gas not capable of consuming the carbon. The second element is a conducting wire passing through the glass wall of the chamber and hermetically sealed therein. On referring to this specification, I find that the conductor referred to passes through an opening in the bottom plate of the lamp, this conductor being sealed air-tight into the opening with cement. The illuminating conductor which constitutes the third element of the said fourth claim is substantially the same as that which is described in the first claim. It consists of carbonized fibrous or textile material, and it has the shape of an arch or loop. With regard to the material, the same ambiguity of construction arises to which I have referred when considering the said first claim. Evidently material may be fibrous without being textile, but I do not know of any material which may be used as a textile material which is not fibrous. Hence, as I said in my last answer, the term "fibrous material" seems to me to be a broader term than the term "fibrous or textile material," and consequently it seems to me that by the addition of the word "textile" the patentees may have intended to limit the word "fibrous." At all events, the
818 same two constructions are applicable in this case which I supposed to be possible in the case of the first claim. The first of these constructions is an equivalent construction, and assumes that the patentees intended to use these two words in the same or in an equivalent sense, meaning thereby, as I understand it, that the property of value in the material was a property common to both fibrous and textile materials; as, for example, when we speak of a spongy or porous substance. The second of these constructions supposes the words "fibrous" and "textile" to be used in the alternative sense, so that a material which is fibrous and not textile would answer the requirements. I do not understand that the usefulness of a material from which to make the incandescent conductor of an electric lamp consists necessarily in the fact that it is fibrous in its structure; that is, that it consists of or contains fibres within its substance. I suppose that a carbon conductor for an electric lamp may be made of material which is not

fibrous, and that such a conductor might answer its purpose effectively.

With regard to the elements of the combination embodied in the said fourth claim it seems to me that the devices constituting the first and second of these elements were abundantly shown and described before eighteen hundred and seventy-eight, not only by these patentees themselves in their earlier patents, but also by De Moleyns, Greener and Straite, Straite, King, Shepard, Roberts, Konn, Kosloff, Woodward and Ladyguine, either in their patents or publications already referred to and herein in evidence. With reference to the third element the material is old in other forms and the form is old in other materials, as I have already pointed out in considering the first claim. Nor do I see that there are any advantages whatever of the form which is claimed which are depend*a*nt in any way upon the material employed; so that in my judgment the advantages of the form and the advantages of the material are entirely independent of each other. The said fourth claim would be substantially produced, as it
seems to me, by placing the carbon conductor of the
819 first claim in one of the old lamp chambers above referred
to, or by adding to the second claim the form of the conductor. If it should be held that the combination of the fourth claim is not a valid combination, then, since each of the three elements separately considered has long been well known and used in the art (possibly excepting the precise form in conjunction with the precise material of the third element, the same form in equivalent material and the same material in equivalent forms having long been so described and used), then there would not seem to me to be any useful novelty set forth in the said fourth claim. Moreover, it is difficult for me to see that there is any novel and useful invention in the said claim, even if the combination itself be held to be valid. The patents of Roberts and of Konn, for example, both seem to me to describe lamps containing the three elements of the said fourth claim or their substantial equivalents for the purposes of the invention. I agree with Professor Brackett that these lamps have circuit conductors passing air-tight into a glass lamp chamber, which glass lamp chamber is either exhausted or contains no carbon-consuming gas, and in which is contained a carbon conductor. This conductor in the Roberts lamp is straight in form, but is made of carbonized fibrous material; while, in the Konn lamp, this conductor has an arch shape and is made preferably of hard carbon. No change would have to be made in either lamp in order to exchange the carbon conductors, and the straight conductor of Roberts seems to me to have substantially the same advantages as the arch-shape conductor of Konn and of the patent in suit. For these reasons there does not seem to me to be any novel and useful invention described in the fourth claim of the patent in suit.

18 Q. Did you take into consideration in making your last answer that the illuminating chamber is stated in the fourth claim of the patent in suit to be "made wholly of glass."

A. I did. In my answer to the tenth question I considered
820 the relative advantages of closing the mouth of the lamp chamber with plates of metal or plates of glass, and I expressed the opinion in the said answer that a metal plate would be the full equivalent of a glass plate for the purposes of the invention described in the patent in suit. Moreover, as I have already pointed out, the use of both glass and metal plates for the purpose of closing the mouths of globes or receivers intended to contain gases or from which the air was to be exhausted by means of the air pump was well known in the art prior to eighteen hundred and seventy-eight. I find, too, in the patents to Staite an incandescent lamp having its mouth closed with a block of glass, and in the patent to Kosloff a block of porcelain seems to me to accomplish substantially the same function. In the patents of Konn and of Roberts the plates closing the lamp chamber are, I believe, of metal; but I do not see that they are not in every way the substantial*ly* equivalent of glass plate for the purpose. In the patent issued to Shepard a lamp is described, which consists of a globe of glass, having a stopper luted into it. I do not find that the patent itself distinctly states that this stopper must be of glass; but taking into account the state of the art and the well-known fact that it was a common practice to close the mouths of flasks and other similar glass vessels, like that used for the lamp chamber in this patent, with stoppers of glass, it seems to me clear that the stopper in the case of the Shepard lamp must have been made of glass. Taking the construction of the lamp as described in the patent of Shepard and shown in the drawing, it is much more probable in my judgment that the said stopper was made of glass than that it was made of metal.

19 Q. Assuming that the proper construction of the expression "fibrous or textile material," used in the fourth claim of the patent in suit, is that the material should be both fibrous and textile, and assuming that defendant's lamp is provided with an incandescent conductor made from carbonized bamboo, does such lamp, in your opinion, embody the invention set forth in the said claim?

821 A. It seems to me that it does not. As I have already stated, bamboo is not, in my judgment, a material which can properly be called "textile," having never, so far as I know, been used for textile purposes; either as such or after having been treated by any process. So far as my knowledge goes, bamboo has never been put into a form useful for textile purposes.

20 Q. Considering the structure of the patent in suit as illustrated in the drawings of the patent, would it be practically feasible, in your opinion, to seal the glass plate "Y" to the flange "X" by the fusion of the glass?

A. In my judgment it would not in consequence of the very considerable thickness both of the flange and of the glass plate.

21 Q. Would it be feasible, in your opinion, in such a lamp structure to fuse the glass plate upon the tubular conductors which are shown as passing therethrough?

A. I do not think that it would. It will be observed that the conductors required to carry the current into the lamp are necessarily quite large, and that the glass plate itself, through which these conductors pass, is quite thick. In order that the tubular conductors should be successfully sealed into the said glass plate by the fusion of the glass itself it would be necessary to employ a metal which was not only unoxidizable under the conditions employed in effecting the fusion, but also one whose coefficient of expansion is practically the same as that of the glass, so that during the changes of temperature to which the lamp is subjected when in use the glass and metal shall not be separated from each other in consequence of the differential expansion of the two substances and so cause a leakage into the chamber. Only one such metal is known which is capable of being used practically for this purpose, viz., platinum. But even this metal when used in large masses would be liable to separate from the glass into which it had been fused provided that its expansion should differ slightly from that of the glass (which I suppose to be generally the case) much more than when used 822 in the form of the small conducting wires which are required to carry the current into an incandescent lamp of high resistance.

22 Q. Please state whether or not in your opinion there is a sufficient description in the specification of the patent in suit as to the character of the fibrous or textile material to be used for the burner to enable others generally skilled in the art as it existed at the date of the application, viz., January 9, 1880, to produce a practically operative incandescent conductor without experiment?

A. The description in the specification of the patent in suit as to the character of the fibrous or textile material to be used for the incandescent conductor is not in my judgment sufficient to enable a person skilled in the art in January, 1880, to produce, without experiment, such an incandescent conductor which would be practically operative. In the first place the materials which are to be employed for producing such a conductor are referred to in the patent in a very indefinite way, being referred to generally either as "a vegetable fibrous material in contradistinction to a similar conductor made from mineral or gas carbon," or as "vegetable fibrous or textile material." Although there are many thousand distinct forms of vegetable fibrous material from which by carbonization such a conductor could be made, some of which are textile materials and some of which are not, yet the specification mentions only two substances specifically which the patentees have made use of in the practice of their invention, to wit, carbonized paper and wood carbon. But even these do not appear to me to be sufficiently definite and precise. For example it does not seem to me that a person skilled in the art could produce a successful incandescent conductor without experiment even if he was instructed to use paper and to carbonize it for the purpose. The word paper in its broad sense is a generic term and not a specific one. Papers are made of a great variety of materials in the first place, most of which are fibrous and some of which are textile. Commonly cotton or linen rags are pulped and converted into

paper. Frequently straw is so employed; and for cer-
823 tain qualities of paper pulp made by treating chemically
various kinds of wood is made use of. But not only may papers thus widely differ from each other in the kind of fibre which is made use of in their construction, but they may differ very widely in the character and the quantity of the materials which are mixed with the pulp for the purpose of loading the paper and so cheapening it. The cheaper class of papers, as I am informed, are very largely weighted with this kind of useless material, the substance more frequently made use of for the purpose being certain kinds of clay. Again, as I understand the matter, papers may differ very materially from each other in their structure, this difference depending, not upon the materials used in their construction, but upon differences in the process employed in making them. The resulting texture of the paper may be open or close and the paper itself may be more or less porous in consequence of the way in which it may have been made. So, after it comes from the paper machine it may be very heavily calendered, so as to render it more or less compact, and it may be sized, glazed, or otherwise subsequently treated to fit it for the special use for which it is intended in commerce. It seems quite evident to me that it would require experiment, even on the part of a person skilled in the art, to select out of all this vast number of papers so different in character and properties those which would be suitable on carbonization to produce a successful incandescent conductor. Indeed, it would be difficult, if not impossible, to obtain a paper which would perfectly fulfill the requirements necessary to produce a carbon completely suited to serve as the incandescent conductor of an electric lamp, and I understand that it is this difficulty which has led to the abandonment in practice of carbonized paper as the material for making such incandescent conductors. The most cursory examination of a sheet of paper when held up to the light would seem to indicate the incapacity of the process of paper-making to produce a material homogeneous and uniform throughout. When such a paper is carbonized it would be denser in certain portions of it and less
824 dense in others; and this want of uniformity in its texture
would cause a variation in its resistance in different portions of its length; this want of uniformity resulting in very irregular heating of the carbon conductor when subjected to the action of the current and a resulting speedy destruction of the conductor itself.

The unsuitableness of wood carbon in the broad sense of that term as the incandescing conductor of an electric lamp would seem to me to be even more marked than that of paper. The term "wood" is a generic term and refers to the material which constitutes the stems of most, if not all, vegetable structures. An examination of the structure of wood shows, as it seems to me, the entire unsuitableness of this substance in general to produce a carbon suitable for use as an incandescing conductor. Indeed, the structure, of almost all the woods which grow in our climate, and therefore which are familiar to us, is such as to completely unfit them

for such a purpose even to a greater degree than is the case with paper. These woods for the most part have the material arranged in them transversely as well as longitudinally. Moreover, the amount of woody matter for a given cross-section not only varies very much for different species of woods, but also varies very much from point to point in the same species. The consequence of this is that not only is it impossible to cut from these woods a piece having an equal amount of the solid woody matter in all the cross-sections of its length, but it is also impossible to produce a piece of wood carbon by carbonizing such a wood, which should be uniform in its structure and density throughout, so that it would not, when heated by the electric current, develope a higher temperature at some points of its length than others, and so be speedily destroyed. That uniformity in the carbon conductor throughout, which is necessary to secure uniform incandescence throughout its length, and which, therefore, is so essential in the modern incandescent lamp, is not, in my judgment, attainable by carbonizing any of the forms of wood which we commonly understand to be indicated by this
825 term. To determine this fact, which I understand to be now
well known and fully recognized, would have required, as it seems to me, even on the part of a person skilled in the art at the time of the application of the patent in suit, a vast amount of minute and laborious experiment.

Even if the term "wood" be not confined to those woods with which we are familiar in this vicinity, woods which are known as oxogenous, or outside growers, and be extended to include endogenous woods, or inside growers, it seems to me, still that extended experiment would have been necessary in January, 1880, to enable a person skilled in the art to produce a successful incandescent conductor for an electric lamp, even with the aid afforded by the patent in suit. The testimony of Mr. Edison, already given in this case, seems to me to establish this fact conclusively, since it shows that so competent an investigator and experimenter as he is had been obliged to examine many hundreds, or, perhaps, thousands, of wood materials, many of which were endogenous, in order to obtain a form of carbon from them which would answer the purposes of an incandescing conductor for an electric lamp. The bare statement of the patent in suit, therefore, that the material to be used for the production of the carbon conductor (which is the essential feature of an incandescent lamp) is vegetable fibrous material, seems to me to be utterly vague, indefinite and unsatisfactory, and does not seem to me to be such a full and complete description as would enable a person skilled in the art, as it existed at the time the said patent was applied for, to produce a practically operative incandescent conductor without experiment.

Adjourned to meet at the office of R. N. Dyer, Esq., 40 Wall street, New York, on Saturday, March 16, 1889, at 11 a. m.

826 New York, *March* 16, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer, Esq., for defendant, and S. A. Duncan, Esq., for complainant; and the direct examination of Prof. Barker was continued, as follows:

23 Q. Are there in your opinion any kinds of paper and any kinds of wood which would be entirely useless for the making of incandescent conductors by carbonization?

A. In my judgment there are many kinds both of paper and of wood which would be practically useless for the purpose referred to. In the case of paper, for example, there are many sorts of paper whose structure is so open or so coarse, and whose structure is so irregular, as to entirely unfit them to make a successful incandescent conductor for an electric lamp. Moreover, it is evident that none of that large class of pa*pa*pers which have been weighted with extraneous materials, such as clay and the like, would answer the purpose. With regard to woods, the same general conclusion follows. The structure of many woods, and, indeed, of exogenous woods in general, is so open and irregular that a uniform carbon conductor could scarcely be made from them, and in the case of some of them could not be successfully made from them at all.

24 Q. Please state whether or not, in your opinion, there is a sufficient description in the specification of the patent in suit as to the method of preparing the fibrous or textile material for carbonization, and carbonizing it to enable others generally skilled in the art, as it existed at the date of the application, viz., January 9, 1880, to produce a practically operative and useful incandescing conductor without experiment?

Objected to as immaterial.

A. In my judgment, the description in the specification is quite insufficient for the purpose. Indeed, it says distinctly that

827 "No especial description of making the illuminating carbon conductors, described in the specification, and making the subject-matter of this improvement, is thought necessary, as any of the ordinary methods of forming the material to be carbonized to the desired shape and size, and carbonizing it while confined in retorts in powdered carbon, substantially according to the methods in practice before the date of this improvement, may be adopted in the practice thereof by any one skilled in the arts appertaining to the making of carbons for electric lighting or for other use in the arts."

This statement of the patent that any of the ordinary methods in practice before the date of the improvement therein contained would enable a person skilled in the art, and without experiment, to produce a practically operative and useful incandescent conductor without experiment does not seem to me to be the fact. In the first place, the method for forming the material to the desired shape and size would not only vary in its details, according to the character of the material operated on, but for a given material experiment would seem to be necessary, in order to determine the details of direction of the fibre, with reference to the said shape, which would give the best results. Moreover, the details of carbonization are even more important to a successful result than the details of forming to the desired shape. It is perfectly well known that the process of carbonizing the material while confined in retorts in powdered carbon, which is the process of the specification, will not result necessarily in the production of a successful incandescent conductor, but that various details of manipulation, of temperature, of the arrangement of the carbonizing vessel and the like, are necessary in order to success, these details being obtained only as the result of experiment.

25 Q. In making such a conductor from wood carbon is it in your opinion essential to the production of a useful and operative device that the material should be cut from the wood in one way 828 rather than in another, and, if so, do you find anything in the specification of the patent in suit to indicate how this is to be done?

A. It does seem to me that it might make all the difference between a useful and useless carbon for the purpose, whether the shape before carbonization were cut in one direction or in another out of the original material employed, the relation of the direction of the fibre to the structure being, I think, a factor of great importance in determining the practical usefulness of the incandescent conductor. I do not find anything in the specification of the patent in suit to indicate even that it is desirable that the material should be cut in one way rather than in another, and, therefore, nothing to indicate the direction of cutting which would be best for the intended purpose.

26 Q. What would be the effect of cutting the wood across the grain or fibres to produce a straight strip or of cutting the arch shape in any direction from the wood?

A. The structure of wood, as I have already stated, is quite different in a longitudinal direction parallel with the fibres than in a transverse direction. Moreover, the differences in contiguous parts are much greater transversely than longitudinally. Hence, if a straight strip were cut from the wood with its length parallel to the direction of the fibre, it would, in my judgment, be much more uniform in its density at different points of its length, and, therefore, would produce a much more uniform carbon conductor than if the said strip were cut with its length in the transverse direction, *i. e.*, were cut across the grain or fibres. Evidently if an arch shape were cut from the wood so that one portion of it were parallel to the fibres another portion of the arch would necessarily be cut transversely to these fibres. In consequence of this the structure would be very unlike in its different parts, would lack uniformity in different parts of its length and when carbonized would produce a carbon entirely unsuited to operate successfully as an incandescing conductor, since it would be very irregular in the amount of the conducting material contained in dif- 829 ferent cross-sections. When in use, therefore, it would heat very differently in its different parts and its life would be brief.

27 Q. What degree of usefulness, if any, would a carbon conductor have, made from a strip cut across the grain or fibre of wood and used either as a straight strip or bent into an arch form?

A. It would seem to me not to have any usefulness whatever.

28 Q. Referring to the original application for the patent in suit and to the patent as issued, please state whether or not in your opinion the same substantial invention is described and claimed in the original application as is described and claimed in the patent in suit.

A. I find in the specification of the original application the statement that

"Our present invention especially relates to the incandescent conductor; its object is to secure a cheap and effective apparatus and our improvement consists in the employment of an incandescent arc of carbon in the circuit as the light-giving medium."

With reference to the said incandescent arc of carbon in which the improvement described in the application is said to consist, the specification says:

"Our improved burner or incandescent arc consists of an arch-shaped or semi-cylindrical piece of carbon A, mounted in its clamps or supports in the usual well-known ways."

The specification further says:

"We have also used such arcs or burners of various shapes, such as pieces with their lower ends secured to their respective supports, and with their upper ends united so as to form an inverted V-shaped burner.

We have also used arcs of varying contours, that is, with rectangular bends instead of curvilinear ones; but prefer the arch shape as the shadow cast by such a burner is less than that produced by other forms of burners."

The first claim in the said application is for "incandescing arcs for electric lights made of carbon."

830 The second claim is "for incandescing arcs of carbon in combination with the circuit of an electric light."

The third claim is "for an incandescing arc of carbonized paper included in the circuit and a close transparent chamber in which the arc is enclosed."

The fourth claim is "for an incandescing arc made of carbonized fibrous or textile material."

It would seem from this that the invention which is set forth in the said application consists in a peculiar form or shape to be given to the carbon forming the conductor of an incandescent lamp, to wit, the shape of an arc; these arcs being of varying contours as the specification states.

The only reference, I believe, to the material which is to be used for the arc to be found in the specification is as follows:

"We have tried carbonized paper covered with powdered plumbago, wood carbon or charcoal and ordinary gas carbon."

This reference to the material seems to me to be entirely incidental, and to be inserted for the purpose of indicating in a general way the kinds of carbon which the patentees had used.

This conclusion that the invention of the application consisted in the use of incandescing arcs of carbon, and that the material is specifically unimportant would seem to be confirmed by the fact that the first two claims refer only to carbon arcs in general.

The patent in suit, as issued, however, states that the invention relates to the substance as well as to the form of the incandescing conductor, and that the substance of which this conductor is to be made is a vegetable fibrous material in contradistinction to a similar conductor made from mineral or gas carbon. The reference to the kind of carbon in the application appears to me to have been changed; so that it reads, in the patent as issued, "we have made use of carbonized paper and also wood carbon."

It seems to me, therefore, that the invention which has been described and claimed in the patent in suit is not the same 831 substantial invention which is described and claimed in the original application, the said invention having been broadened so as to include the specific material as well as the form of the conductor in its progress through the Patent Office.

Moreover, the specific materials to be used for the purpose of forming the arc have been greatly extended in the patent as issued, as compared to the application. The statement of the application that "carbonized paper covered with powdered plumbago, wood carbon or charcoal, and ordinary gas carbon," had been tried, appears to me to indicate that these materials had been found the equivalents of each other for the purposes of the invention. But in the patent as issued the omission of the words "covered with powdered plumbago" seems to me to extend the material beyond its original scope. So, too, in the application "wood carbon or charcoal" are referred to in equivalent terms, as it seems to me. In the patent as issued, the omission of the word "charcoal" appears to me to extend the material to all forms of wood carbon, whether charcoal or not, and thus to broaden the range of material to be employed. Again I find that in the patent as issued the words "ordinary gas carbon" are not only omitted from the list of materials mentioned in the application, but the substance to be used for the incandescent conductor is stated to be carbon from vegetable fibrous material in contradistinction to a similar conductor made from mineral or gas carbon.

29 Q. The opinion has been expressed by complainant's expert that the reference to carbonized paper in the third claim of the original application, and the reference to carbonized fibrous or textile material in the fourth claim of said application indicate a preference for a specific kind of carbon. Please state what your views are upon this subject.

A. I do not see anything in the language used which seems to me to justify such a conclusion, as I understand the matter. I believe it is the custom frequently to restate the invention of a patent in different forms in its various claims, and it seems to me that this is a case of the sort, the third and fourth claims being narrower 832 than the first and second, and claiming, not broadly, arcs of carbon but arcs of carbonized paper or carbonized fibrous or textile material specifically; and this, as it seems to me, without indicating any preference for either of the forms mentioned.

30 Q. I call your attention to the fact that in the original application "wood carbon or charcoal" is stated as one of the materials used, while in the patent as issued this is replaced by the words "wood carbon." Do you attach any significance to this change?

A. The significance of this change seems to me to depend upon the fact that subsequent to the filing of the application it was ascertained that incandescing conductors for electric lamps could be successfully made from wood carbon while they could not be successfully made from charcoal, and hence, therefore, it became necessary either to differentiate between wood carbon and charcoal, or to drop the word "charcoal" altogether. The latter is what seems to have been done.

31 Q. Do you agree with the opinion expressed by complainant's expert, Mr. Pope, in his answer to Cross-Q. 130, that in the original specification "wood carbon" is used as an alternative term for "charcoal"?

A. I do; these terms seeming to me to be equivalent terms as there used.

32 Q. What character of material would you understand to be meant by the term "wood carbon or charcoal," as used in the original application?

A. Generally, that material which is ordinarily called by the name "charcoal" and which is produced by carbonizing any of the familiar varieties of wood by any of the well-known processes.

33 Q. What do you understand is meant by the expression used in the original specification: "Carbonized paper covered with powdered plumbago"?

A. It seems to me that it means paper which has been carbonized and which is covered with plumbago. As to the process by which it was made, the specification does not appear to enable me to determine. It may have been made either by covering 833 the paper with powdered plumbago and then carbonizing it, or it may have been made by carbonizing the paper first and then covering it with powdered plumbago. It is possible, too, as it seems to me, that the carbonization may have been attempted electrically, the powdered plumbago being used to facilitate this operation by rendering the surface conducting.

33½ Q. Was there anything known in the art at the date of the application for the patent in suit which would be described by the words "carbonized paper covered with powdered plumbago"?

A. Not to my knowledge.

34 Q. Assuming that the words "carbonized paper covered with powdered plumbago" mean that the paper—say blotting paper—is to be taken and rubbed with the powdered plumbago, and is then to be connected with a source of electric current and an attempt made to carbonize it by passing a current through it, would such an operation, in your opinion, be practically useful or operative for the manufacture of incandescing conductors or burners for electric lamps?

A. Certainly not. Even if by rendering the surface conducting by covering it with plumbago, some sort of carbonization of the paper could be affected by means of a current, this carbonization would be exceedingly incomplete and unsatisfactory, and the product itself would be worthless in my judgment for an incandescing lamp conductor.

35 Q. Would it be feasible to make a useful or operative incandescing conductor by carbonizing by passing the electric current through paper covered with plumbago, if such paper were enclosed in a reservoir containing hydrocarbon gas or hydrogen or nitrogen, the reservoir being of glass and sealed up and the metallic conductors to which the paper was affixed passed through to the interior of the reservoir in which the gas is contained?

A. It would not in my judgment. My last answer supposed the
carbonization to be effected without access of air, and I do
834 not see that the present question involves any other condi-
tion that would be likely to modify the result.

36 Q. I call your attention to the fact that the expression "carbonized paper covered with powdered plumbago" of the original specification has been changed to "carbonized paper" in the patent in suit, and that the original specification gives no description of the method of carbonizing other than is to be inferred from the words just quoted, while the patent in suit states that the material is to be carbonized "while confined in retorts in powdered carbon," assuming that the original specification intended that the paper should be carbonized by passing an electric current through it after it had been covered with powdered plumbago, what significance do you attach to the changes indicated between the original application and the patent as issued?

A. Inasmuch as I have already expressed the opinion that the process assumed in the question for preparing the carbonized paper referred to in the application is not a practically operative process, and the product of it worthless as an incandescing conductor; and inasmuch as the process of the patent of carbonizing the material while confined in retorts is in my judgment a practically operative one, it seems to me that the change referred to in the question is a substitution of a process capable of successful commercial application for a practically inoperative process of no value whatever as a method for making a useful incandescing conductor. In short, the significance of this change under the assumptions of the question seems to me to lie in the fact that by making it, a valuable process is substituted for one which is practically worthless.

37 Q. I call your attention to the opinions expressed by Professor Brackett in answer to questions 25, 26 and 27; do you agree with him in these opinions?

A. I do. The significance of these changes, in my judgment, lies in the fact that the patent in suit is thereby extended to include structures quite different from those contemplated by the patentees
at the time of filing their application. The progress of the
835 art had shown the defects of the patentees' lamp as originally
constructed. It had also shown what requirements were neces-

sary in a lamp in order that it might successfully accomplish the purposes intended. To change the application in this way seems to me to be an attempt to include the newer and improved construction under a form of words applicable to the older constructions of the patentees, though, as it seems to me, in quite a different sense.

In the United States patents 223,898 and 227,229, issued to Thomas A. Edison January 27th and May 4th, 1880, the well-known form of lamp which has proved commercially successful is shown for the first time. This lamp appears to me to be free from the serious defects of the patentees' lamp. Its parts were sealed together by the fusion of the glass. The only method of sealing by which a vacuum can be successfully maintained. The leading-in wires were of small size and were also sealed into the glass by fusion. The entire lamp seems to me to constitute a radically new idea in incandescent lighting. In this lamp there is no joint filled with a cementing material; but the parts are united into a single complete whole by fusion so that the lamp chamber is, in fact, composed wholly of glass. That such a lamp so radically new and different from any previously known should be claimed to be brought by this change within the scope of the patent in suit as issued seems to me to show very clearly the significance of the changes referred to in the question.

38 Q. I call your attention to the opinions expressed by Professor Brackett in answer to questions 29 and 30. Do you agree with these opinions?

A. I do. The significance of the changes referred to lies in the fact, I think, that they are of the same nature so far as their effect is concerned as those which have been already mentioned; these changes being evidently intended to widen the scope of the application so as to include methods of introducing and sealing the leading-in conductors which subsequent experience had shown to be necessary. I also agree with Professor Brackett in the opinion that the structure shown in the drawings of the patent in suit is not adapted to have the electrodes sealed into the glass by any of the well-known methods of sealing metal electrodes to glass previous to the filing of the application. 836

39 Q. Do you agree with the statement contained in answer 31 of Professor Brackett's deposition with regard to the manufacture of commercial incandescent electric lamps provided with carbons made from carbonized non-fibrous material?

A. I do, and I have such lamps in my own collection.

40 Q. The opinion has been expressed in substance by complainant's expert that the mere mention of carbonized paper in the specification of the original application for the patent in suit forms a definite indication that the inventors intended to employ a fibrous material reduced to size in at least one dimension before carbonization and that the carbonization of such a material would produce a carbon possessing valuable qualities for incandescent lighting. Please state whether or not you concur in this view.

A. I do not concur in it; I do not find in the application referred to any expression whatever which seems to me to justify such

a conclusion. The mere mention of carbonized paper in the specification of this application would not seem to me to justify so radical a conclusion. The object of using paper seems to have been solely to obtain readily a fibrous material. The said specification speaks of "carbonized paper covered with plumbago," and it seems to me that if the paper here referred to is covered with plumbago for the purpose of carbonization by the current that its thickness must be determined by the current which is to be employed in carbonizing it and moreover it seems to me that the simple mention of "carbonized paper covered with plumbago" is not sufficient to enable a person skilled in the art at the time to produce without experiment a practically operative incandescing conductors. The thickness of the carbon conductor might, as it seems to me,
837 require alterations by cutting or otherwise in the thickness
as well as the length and breadth of the material employed. If the paper used were thin it might be necessary to cement several layers of it together, and if it were thick it might be necessary to file it down. But of all this nothing is said in the specification. Indeed, to determine the proper size of the material before carbonization required to produce a proper size of carbon conductor would also require experiment, since the relation of the two is nowhere alluded to in the specification.

Hotel Lafayette,
Philadelphia, *March 20th*, 1889.

Met pursuant to arrangement of counsel.

Present: Walter K. Griffin, Esq., for defendant, and L. E. Curtis, Esq., for complainant; and the examination of Professor Barker was continued as follows:

Questions by Mr. Griffin:

42 Q. The opinion is expressed by complainant's expert, Mr. Pope, in answer to cross-questions 130 and 166, that omitting the reference to carbonized paper in the original application for the patent in suit there would be no sufficient description in the specification of the carbon having certain peculiar and valuable qualities which he thinks as applied to incandescent lighting, is the invention of the patentees, but that the mere mention of carbonized paper in the specification of the original application would be sufficient to enable any one following the specification to obtain a product having these certain valuable properties or qualities without any further experimentation. Do you agree with him in this opinion?

A. It seems to me that this is an extreme view of the matter, and one that is wholly unwarranted by the language of the speci-
838 fication. In the first place, as I have before stated, the
specification of the original application for the patent in suit does not mention carbonized paper *per se*, but "carbonized paper covered with powdered plumbago." Whether results of any usefulness whatever would be secured by the following of such direction as is contained in the statement "we have tried carbonized paper covered with powdered plumbago" would depend upon how

that direction is taken. It has no certain definite meaning of itself. If it means that the paper covered with powdered plumbago is to be carbonized by the current, the result would undoubtedly be useless and would not have the properties or qualities which Mr. Pope thinks necessary to the invention. If the direction is to be taken as meaning to cover the paper before or after carbonization with the plumbago, it is evident that, to whatever extent the plumbago is applied to the material, to that extent will the plumbago become a more important factor and the paper carbon a less importan factor in the resulting burner. The plumbago could be applied t such an extent, either before or after carbonization of the paper, that the paper carbon would become an unimportant factor and would act principally as a core to assist in sustaining the plumbago, and such a carbon conductor I take it would not have the peculiar properties and qualities which Mr. Pope thinks are essential to the invention. If a person took the direction to mean to carbonize by the current it would certainly require experimentation for him to ascertain that a suitable carbon conductor could not be made i that way; then if he thought it meant to cover the material wit plumbago either before or after carbonization, he would have t find out by experiment how to do that, and since the specification does not tell him how to do it, or to what extent to apply the plumbago, and does not tell him even the characteristics which it is desired to obtain, or whether the desired characteristics are those to be found in the plumbago or in the paper carbon, he is left entirely without direction either as to procedure or product, and he 839 must grope around until he not only finds the proper qualities or properties for his product, but also finds how to produce them.

Again, the original specification speaks of three materials for the arch-shape burners, viz., the carbonized paper covered with powdered plumbago, the wood carbon or charcoal and the gas-retort carbon. These apparently are mentioned indifferently an with equal force and would serve to mislead the constructor, attempting to follow the specification, as to what the desired properties or qualities for such a burner would be. In addition, I take it, from the fact that paper is such a comprehensive term and that so many materials included by that term would be useless, that the simple direction to use carbonized paper would only serve to point out a class of material upon which experiment would be necessary in order to obtain a paper carbon.

43 Q. I call your attention to the opinions expressed by defendant's expert, Professor Brackett, in his answers to questions 33 to 37 inclusive. Do you agree with him in those opinions?

A. I do. It does not seem to me that the carbon burner of the patent in suit would have the advantage of contracting and expanding between fixed terminals without breaking, which advantage has been incorporated by description in the patent in suit as issued but was not mentioned in the original specification. Such an advantage does exist in the modern incandescent lamps which have exceedingly small and flexible carbon conductors, which by

reason of their great flexibility take up the contraction and expansion in their length by changing in shape and without straining the connections with fixed terminals. This is an advantage due to flexibility rather than to the shape of the carbon conductors, the loop shape being employed principally to give greater length of conductor within the lamp. The addition of this matter of description to the patent in suit would seem to be intended to apply to the shape of the burner of the patent in suit, an advantage which it does not have, but which is possessed by the in-
840 candescent conductors of modern and successful lamps by reason of the flexibility of their conductors.

44 Q. What kind of a lamp burner do you understand is described by the following statement contained in the patent in suit: "We have also used such conductors or burners of various shapes, such as pieces with their lower ends secured to their respective supports and having their upper ends united so as to form an inverted V-shaped burner"?

A. I understand this to mean what is known as a "semi-incandescent lamp"—that is, a lamp having two carbon conductors brought into contact, a light being produced by the incandescence of the pieces of the carbon at or near the points of contact where the resistance is greatest. The two '78 patents of the patentees, viz: 205,144 and 210,809 describe lamps of this character—also the patent of Shepard.

45 Q. Would carbon pieces made from a carbonized fibrous or textile material have any advantages over a hard carbon for such a semi-incandescent lamp?

A. The hard or mineral carbon would in my opinion be superior for such a lamp.

46 Q. Would there be any difficulty in making a carbon burner of the size and shape as that shown in the patent in suit from hard carbon, such as from Carre's mixture?

A. I can see no difficulty in doing so.

47 Q. What do you understand by the statement contained in Konn's patent No. 3809 of 1872, that the carbon conductors "are preferably graphite"?

A. I would understand from that expression that the patentee intended to avail himself of any of the forms of carbons which were known to be suitable for electric light such as carbons of wood and various other fibrous material such as hemp, flax, cotton and paper.

48 Q. Was carbon obtained from bamboo known at the date of the application for the patent in suit, viz: January 9, 1880, as an equivalent for carbon from paper or for the ordinary wood carbon or charcoal?

A. Not to my knowledge for any purpose whatever.

49 Q. Have you read and do you understand French let-
841 ters patent No. 113,706 of July 12, 1876, issued to Octave Gauduin and the certificates of addition thereto dated April 7, 1877, and June 12, 1877, respectively? If so, please describe such

matters contained therein as in your opinion are more particularly material to the questions herein at issue?

A. I have read the said letters patent and the certificates of addition thereto and believe that I understand them.

I find that the object of the invention which is set forth in the original patent is the production of various physical and chemical articles such as crucibles, pencils for producing the electric light, etc., which the patent states should be made of chemically pure carbon. This object the inventor obtains by decomposing in close vessels various carbonaceous materials such as tar, resins, bitumens and the like, thus producing a very pure coke which is mixed after pulverization with tar, pitch or similar material to a plastic mass and is then forced through a die, thus forming said pencils for the electric light which are subsequently carbonized at a high temperature.

The first certificate of addition describes a multiplication of this process which enables the inventor to give to the carbon the definite form in which it is desired to preserve it and which simplifies considerably the manufacture. The process here described consists substantially in shaping the crucibles, vases and pencils for electric light or electro-chemical purposes, etc., out of dry and properly selected wood by any method suitable to be used in working wood. The object thus shaped in wood is then converted into a hard and compact carbon preserving the original form by suitably drying it, impregnating it with tar, bitumen, sugar, caramel, etc., and heating it, at first slowly and finally to a high temperature in a reducing atmosphere. To especially purify the carbon the inventor treats it during the intermediate stage with acids, alkali-s, etc. He further states that he has also manufactured articles in carbon with cotton, hemp, linen and cellulose impregnated in the same way with 842 tar or other similar material and shaped in such a way as to give to it the form desired, treating it subsequently in the same way as in the case of the wood already mentioned.

In the second certificate of addition dated June 12, 1877, Gauduin describes the particular form of tubular furnace by means of which the said crucibles, electric light pencils, etc., can be baked continuously at a high temperature.

50 Q. In view of the Gauduin patent and in particular in view of the certificate of addition of April 7, 1877, have you any further statement to add to your previous direct testimony as to the novelty of the use of a vegetable fibrous carbon or a vegetable textile carbon as an incandescent conductor for an electric lamp prior to the year 1878?

A. It seems to me that we have described in said certificate of addition electric light conductors produced by forming the material to be carbonized, to wit, vegetable fibrous material in the form of wood to the desired shape and size and then carbonizing it in closed vessels. It seems to me further that we have described the manufacture of objects in carbon by carbonizing various forms of textile material such as cotton, hemp, linen, and cellulose of any desired kind, shaped in the form desired by mixing it with tar or other similar material and then carbonizing it.

The patent itself does not state specifically whether the said carbon pencils are to be used for arc or for incandescent lighting, but inasmuch as both forms of lighting were well known in the art at the time, I see no reason for supposing that the inventor intended to restrict their use to either of these modes of lighting. Indeed, to my knowledge the said Gauduin pencils were made of various sizes within a considerable range; some of them being not over a millimetre or two in diameter, as I recollect them, and therefore adapted only to the production of light by incandescence.

Further, it does not seem to me to have required invention, in view of the state of the art in 1878, to substitute the carbon conductor thus made by the Gauduin process from vegetable fibrous 843 material put into the desired shape before carbonization for the straight or curved pencils of mineral carbon which had been already used in the incandescent lamps to which I have already referred; such, for example, as that of Kosloff and Konn; or that it would have required invention at that date to substitute the said Gauduin pencils for the pencils of mineral carbon described by the patentees of the patent in suit as used in their prior patents already referred to in this case.

Defendant's counsel offer in evidence letters patent of the Republic of France dated July 12, 1876, and certificates of addition thereto dated April 7, 1877, and June 12, 1877, together with translations of the same as exhibits on behalf of defendant and the same are marked as follows:

(40.) Defendant's Exhibit Gauduin Patents of 1876 and 1877. The stipulation entered into on March 13, 1889, as to the defendant's patents and publications is extended to said Gauduin exhibit.

Cross-examination of Prof. Barker by Mr. Curtis:

51 X Q. Do you mean by your answer to question 14 that you consider any of the "references in evidence herein" to be direct anticipations of the first claim of the patent in suit?

A. I meant to be understood as expressing the opinion that the references taken together showed direct anticipation rather than the opinion that any one of them showed such a complete anticipation.

52 X Q. By "the references in evidence herein" you mean the patents and publications put in evidence by the defendant at the commencement of your deposition?

A. Yes; I intended to be so understood.

53 X Q. Do you regard either one of these patents or publications as a direct anticipation of the first claim of the patent in suit?

A. It seems to me that in two of these references at least 844 devices are described which are the substantial equivalents of the device which forms the subject of the first claim. In the English patent to Roberts, I find described an incandescent conductor for an electric lamp made of carbonized fibrous material. In the specification I do not find any statement as to the shape of this conductor, but in the drawing attached thereto it is shown as having straight sides. Inasmuch as the advantages set forth in the patent in suit as belonging to the arch form of incandescent conductor seem to me to be secured to the same extent by the form of the said conductor shown in the Roberts patent, I think the opinion justified that for the purposes of invention the conductor of Roberts is a substantial equivalent for the conductor described in the first claim of the patent in suit.

In the English patent to Konn, No. 3809, of 1872, I find described an incandescing conductor for an electric lamp, which, as to form, appears to me to be of an arch or horseshoe shape, and as to material, may be made, I think, of any substances suitable for the purpose which were known in the art at the time the said patent was applied for. This conclusion seems to be justified by the fact stated in the specification that the incandescing conductors employed are to be made "preferably of graphite." This clearly indicates to me that Konn was fully aware that carbon in other forms was suitable for the purpose and that these other forms had already been known and used as incandescing conductors for electric lamps. Inasmuch as Sidot had described two or three years before a process for pro*pro*curing forms of carbon by carbonizing fibrous or textile material, which forms of carbon were characterized by their great conductivity of heat and electricity, it seems to me fair to assume this fact as known to Konn as a part of the knowledge of the art at the time, as it certainly was a part of the common knowledge of those skilled in the art in 1872. Konn's statement therefore seems to me equivalent to saying that while graphite had the preference in his mind as the material for a conductor, he did not intend
845 to limit it to this material, but that any material might be
used which was a well-known equivalent of graphite for the purpose at the time.

54 X Q. Taking everything into consideration, which of these two English patents do you regard as the most complete and satisfactory anticipation of the claim referred to?

A. It does not seem possible to me to discriminate between them in this respect.

55 X Q. Then do you consider the two as equally complete and satisfactory anticipations?

A. It seems to me that they are for the purposes of the invention of the first claim.

56 X Q. In which of the prior patents and publications referred to in your answer to question 16, do you find what seems to you to be the most complete and satisfactory description of the invention referred to in the second claim of the patent in suit?

A. In the English patents issued to Shepard and to Roberts and in the publication of Ladyguine I find described the combination of an electric circuit and an incandescing conductor of carbonized fibrous material, and a transparent, hermetically sealed chamber enclosing the said conductor, which I understand to be the combination referred to in the second claim. It further seems to me that for the purposes of the said second claim these said three references are equally important and show substantially the same combination. The said three references seem to me to describe the combination referred to more completely than any of the other references.

57 X Q. Are you able to select either one of the three as containing, in your opinion, a better description of the combination referred to than either of the others?

A. I do not think that I am.

58 X Q. Did you mean by your answer to question 17 that you regarded either of the prior patents or publications there referred to when taken by itself as containing a complete description of the invention described in the fourth claim of the patent in suit?

846 A. In the said answer I stated that:

"The patents of Roberts and of Konn, for example, both seem to me to describe lamps containing the three elements of the said fourth claim or their substantial equivalents for the purposes of the invention."

The said fourth claim, in my judgment, would be substantially produced by placing the carbon conductor of the first claim in one of the old lamp chambers shown and described for this purpose before 1878; or by adding to the second claim the form of the conductor. With reference to the elements of this claim the statement of Greener and Staite, made in 1846, seems to me important. In their patent the inventors say:

"We think it unnecessary to describe either how the air-tight vessel which is to enclose the illuminating bodies should be mounted or how the electric currents are to be conveyed to them from the voltaic battery or the magnetic machine employed, because there are many well-known modes of doing so, and we do not claim to have invented anything new in this respect. We desire further to be understood that we lay no claim to the employment of carbon, platinum, or like difficult fusible metal enclosed within air-tight vessels as a medium for the development and exhibition of electric lighting or the suitableness of both bodies for the purpose when so enclosed (subject to the difficulties aforesaid) being long well known."

Taking into consideration what I have said in previous cross-answers it seems to me that the patents to Roberts, Shepard and Konn show and describe the elements in combination substantially which are the subject of the said 4th claim; but I did not intend to say that I regarded either of these references as containing a complete literal description of the invention set forth in the 4th claim.

59 X Q. Do you then regard either of the three patents just referred to as containing in itself, without reference to the others, a description of the combination referred to in the 4th claim of the patent in suit?

A. It seems to me that in neither of the three patents re-
847 ferred to, taken alone, is there a complete literal description
of the elements in combination which is referred to in the
4th claim.

60 X Q. Which one of these patents approaches nearest, in your

opinion, to a complete and satisfactory description of the combination referred to in the 4th claim?

A. That would depend, as it seems to me, upon the relative importance to be assigned to the various elements of the combination and to the departures, if any, from the literal description given in the claim. In some respects the lamp of the Shepard patent meets most fully the requirements. In other respects these are met most fully by the lamp of the Konn patent. In still other respects the lamp of the Roberts patent has the advantage.

61 X Q. Which one of all the prior patents and publications put in evidence by the defendant would you select for the purpose of anticipating the 4th claim of the patent in the suit, if you were confined to one of the said patents and publications for that purpose?

A. It has always seemed to me that the English patents to Roberts to Shepard and to Konn and the publication of Ladyguine exhibit as clearly as any of the references in this case the invention described in the 4th claim; while none of these references describe literally the precise invention thus claimed, it seems to me that taken together they do describe this invention. Regarding the departures in the individual cases as of equal importance it would seem to me impossible to say that any one of these references described the invention in the literal sense more fully than the others. It is extremely difficult to determine in which case the advantages preponderate. But as I look at the matter at present it seems to me that the English patent to Shepard is on the whole to be preferred.

62 X Q. In your answer to question 9 you say:

"I find *that* in the state of the art before the date of the patent in suit the use of both mineral carbon and of carbon from vegetable fibrous material as the incandescing conductor of an electric lamp.

848 I find further that this carbonized fibrous material was used in the said incandescent lamps or was described for such use either in the form of straight pencils or in the form of arch or equivalent shapes."

Did you in these statements refer to the state of the art as shown in the prior patents and publications put in evidence by the defendant?

A. I did.

63 X Q. In which of the said prior patent- and publications do you find the most complete and satisfactory description of the use of "carbon from vegetable fibrous material as the incandescing conductor of an electric lamp"?

A. I find that the use of carbon from vegetable fibrous material as the incandescing conductor of an electric lamp is described in the English patents granted to Greener & Staite, to Shepard, to Roberts and to Konn, by implication, also in the publication of Ladyguine in the "Journal of the Society of Arts." It seems to me that the descriptions given in the patents of Shepard & Roberts, and in the publication of Ladyguine are equally complete and satisfactory upon this specific point.

64 X Q. In which of the prior patents or publications do you find a description of the use of carbonized fibrous material in incandescent lamps in the form of arch or equivalent shapes?

A. The reference which I had in mind is the English patent to Konn, No. 3809, of 1872, when taken in connection with his English patent No. 91 of 1873. The former describes a carbon incandescing conductor in the arch or inverted V form; while the latter, which uses the incandescent carbon for heating purposes states that this conductor may be used in other shapes. The expression "preferably of graphite," as I have already stated, seems to me to imply that carbon of other forms known to be equivalents for this purpose may be used.

65 X Q. Is that the best description you find in the prior patents or publications of such use?

A. I believe that it is.

849 66 X Q. Was the process of carbonization well known in the arts prior to 1880?

A. Broadly speaking, I think that it was. By this I mean that it was known that the proportion of fixed carbon in organic substances in general could be increased by heating them to a high temperature.

67 X Q. The process consisted of exposing the material to be carbonized to a high temperature in a closed vessel or chamber so as to exclude the air, did it not?

A. Practically I think that it did.

68 X Q. Is a cotton thread a fibrous or textile material?

A. I believe it is usually so regarded.

69 X Q. Have you any doubt in regard to it?

A. I think that I should so regard it.

70 X Q. Would a cotton thread carbonized by heating it to a high temperature in a closed vessel be a practically operative incandescent conductor?

A. Not necessarily, I think.

71 X Q. Do you think some further description than this would be necessary in order to enable you to say whether such a conductor would be practically operative or not?

A. While I should regard instructions to use a cotton thread for the purpose of making an incandescing conductor as much more specific than instructions to make such a conductor from fibrous or textile material, yet it seems to me that in the absence of any other directions some experiment might be necessary in order to make a practically operative incandescent conductor from a cotton thread.

72 X Q. What further directions would be necessary, taking into consideration the prior patents and publications with regard to carbonization and the general state of the art with reference to that subject as known prior to 1880?

A. Perhaps no further directions would be necessary.

73 X Q. What is your opinion in regard to it?

A. While I do not think that simply to carbonize a cotton
850 thread would necessarily make a practically operative incandescent conductor, yet I do not wish to be understood as ex-

pressing the opinion that it would not be possible to carbonize a cotton thread so as to produce such result. Indeed, my opinion is that this might be done.

Adjourned till Thursday, the 21st inst., at 2 p. m.

Resumed pursuant to adjournment.

74 X Q. Can't you give me a more definite opinion as to whether any further directions than those set forth in cross-question 70, would or would not be necessary for making a practically operative incandescent conductor?

A. I do not think that I can give a more definite opinion than that which is expressed in the last sentence of my last answer.

75 X Q. Why do you entertain any doubt on the subject?

A. I do not entertain any doubt on the subject.

76 X Q. Then do you think that such directions would be adequate for the purpose both with respect to the proper selection and preparation of material and with respect to the proper method to be employed for carbonization?

A. I think that in all probability a practically operative incandescent conductor might be made from a cotton thread carbonized by heating it to a high temperature in a closed vessel without further directions.

77 X Q. Do you mean to express any doubt as to whether a cotton thread so carbonized, would be a practically operative incandescent conductor, assuming only that such a thread were selected and it were prepared and carbonized in such a manner as would be done by a person skilled in the art as it stood prior to 1880, without experiment?

851 A. I mean simply to say that in my judgment a practically operative incandescent conductor could in all probability be made from a cotton thread carbonized by heating it to a high temperature in a closed vessel by a person skilled in the art prior to 1880, without experiment.

78 X Q. Have you any doubt in regard to it?

A. I don't understand the question. I stated in my last answer that in my judgment a certain thing could be done. I do not see how I can answer the question, therefore, except by saying that I have no doubt that in my judgment this thing could be done.

79 X Q. There are a great many different kinds of cotton thread, are there not?

A. I do not exactly understand what is referred to by the word "kind."

80 X Q. Are there not different sizes of cotton thread, thread dyed and undyed, glazed and unglazed, some which are twisted harder then others, and thread made of different numbers of strands and different kinds of cotton?

A. I believe that there are.

81 X Q. Are not various kinds of cotton thread filled with various dyes and glazed with various substances which would unfit them for use in making practically operative incandescent conductors?

A. I do not think so. In the first place the amount of dyeing or glazing material is very trifling, I believe, as compared with the whole mass of the thread. In the second place, such dyeing and glazing material being for the most part organic would be carbonized when the thread was. And, in the third place, I should suppose that a person skilled in the art would exercise some judgment in the selection of the cotton thread suitable for the purpose.

82 X Q. Would all cotton threads be suitable for the purpose so far as their structure is concerned? I mean with reference to the kind of cotton fibre employed in making them the number of strands, the tightness or looseness of the twist and the uniformity of gauge.

852 A. I should hardly like to say that all cotton threads would be suitable for the purpose, but I think it would be easy to select a cotton thread which would be so suitable.

83 X Q. In this also do you think that a person skilled in the art as it stood in 1880 would be able to exercise sufficient judgment to select a thread suitable for the purpose without experiment?

A. It seems to me that he might.

84 X Q. What kind of a thread do you think he would select as suitable for the purpose and what kind do you think he would reject as unsuitable?

A. It seems to me that such a person would probably select a thread uniform in size and made of pure material.

85 X Q. Having selected a proper thread do you think that such person would have been able to carbonize it properly without experiment so as to produce a practically operative incandescent conductor?

A. It seems to me that he might.

Cross-examination closed.

GEORGE F. BARKER.

Affirmed to before me,

WILLIAM T. FARNHAM,
Special Examiner.

Adjourned till Saturday the 23d inst., to meet at the office of defendant's counsel 40 Wall street, New York, at 11 a. m.

NEW YORK, *March* 23, 1889.

Met pursuant to adjournment.

Present: R. N. Dyer, Esq., for defendant, and R. H. Duncan, Esq., for complainant.

The witness, Professor GEORGE F. BARKER, being recalled by the defendant and reaffirmed, deposes and says in answer to questions by defendant's counsel:

853 1 Q. Are you acquainted with the construction of Geissler tubes; if so, please state how they are constructed, what they are used for, and how long they have been known?

A. I am acquainted with the construction of Geissler tubes; have

had many of them in my collection of apparatus, and have made many experiments with them. Soon after the perfection of the induction coil when it became possible to use this coil for the production of the electric discharge of gases more or less rarified, a glass-blower of Bonn under the direction of Professor Plücker undertook to produce tubes of various sizes and forms made of glass and permanently exhausted and sealed by fusion, for the purpose of replacing the cumbrous apparatus made jointly of glass and metal which had hitherto been used for passing the spark through gases. In consequence of the fact that the name of the said glass-blower was Geissler the tubes thus made by him or subsequently made by others upon the same principle are called Geissler tubes. These tubes being made of thin glass, and having the various parts sealed by fusion, were found to maintain a better vacuum than had been possible in the older forms of air-pump receivers the parts of which were separated by ground joints, usually having some fatty substance as tallow applied to their surfaces. This fact, together with the novel and beautiful effects produced in these tubes by the skill of the glass-blower, caused them to come extensively into use for experimental purposes. The current from the induction coil—a current therefore of very high tension—was conducted into the said tubes through small wires of platinum sealed into the glass by fusion. The electric discharge took place within the tube between the wire terminals and passed through a distance varying from a few inches to several feet according to the size of the tube, and the character of the induction coil used. The exhaustion produced in these tubes was various depending upon the conditions to be attained, but was never very high since a high vacuum increased the resistance and thereby diminished the brightness of the tube. I do not recall the year when these tubes were first introduced
854 by Geissler, but they have been familiar to me for twenty years or more.

2 Q. Please state, whether or not, in your opinion, the Geissler tube construction of chamber was, or is, or has at any time been known as a substitute or equivalent for the enclosing chamber of electric lamps like that shown and described in the patent in suit.

A. Not to my knowledge. There does not seem to me to be anything in common between the two except in the most general sense; and the one, therefore, would not seem to me likely to suggest the other as an equivalent for it. Indeed, prior to the description by Mr. Edison of his incandescent lamp there does not seem to me to have existed any form of incandescent lamp for the inclosing chamber of which the Geissler tube construction of chamber could properly be said to be a substitute or equivalent. So far as I know, no person had up to that time suggested the Geissler construction as applicable to incandescent lamps.

3 Q. Please state whether or not, in your opinion, the Geissler tube construction of chamber is applicable to or useful in the construction of lamps such as that described and shown in the patent in suit, or of any incandescent lamps that were known prior to the

publication of Mr. Edison's lamp construction in December, 1879, giving your reasons for any opinion you may express.

A. In my opinion the Geissler tube construction of chamber would not be applicable to or useful in any of the incandescent lamps referred to in the question, except those of Mr. Edison. The earlier forms of incandescent lamp—a form closely followed by the lamp of the patent in suit—seem to have been constructed upon the same general principle as that well known at the time for arc lamps, to wit, the principle of a somewhat elaborate and complicated structure which would allow of the replacement of the carbon conductor when necessary. Hence the lamp chamber was made thick and heavy, and it was closed by a plate fitted tightly to its opening but yet removable at will. Through openings in this plate, or its equivalent, passed the
855 wires or rods necessary to convey the current into the
apparatus. Since the incandescent conductor in these lamps was uniformly, I believe, of low resistance—about one ohm—it was necessary to make the conductors which carried the current into the lamp of large size and to contrive some method of making the joint air tight at the point where they passed through the said plate. I do not see that any material advantage would have been secured to a lamp of this kind by adopting the construction of the Geissler tube chamber. Evidently, I think, the necessity existing in all these lamps of renewing the carbons from time to time (and this quite frequently) would have prevented the joining of the glass parts of the lamp chamber by fusion of the glass, as is done in the Geissler tube, from being of any advantage to the incandescent lamp itself. And, further, because of the low resistance of the incandescent conductors employed in these lamps and the consequent large amount of current which it was necessary to convey into them for the production of the light necessitating the use of large leading-in wires, it does not seem to me that the method of sealing these leading-in wires into the glass, as in the Geissler tube construction, would have been of any material use; and this because, in the first place, these leading-in conductors must be of platinum—a poorly conducting metal—in order to be sealed into the glass at all. And in the second place, it would not be possible to maintain air tight the junction between the glass and the metal, in my judgment, for the reason that the heat conducted by the platinum to this junction would be liable to crack the joint by the differential expansion between the metal and the glass; even supposing that glass and platinum of the same coefficient of expansion precisely were employed, a thing extremely difficult to do at all times upon a commercial scale.

Because, therefore, the old lamps which have been referred to in the question, like the lamp of the patent in suit, required to be taken apart in order to renew the carbon, because these lamps
856 were substantial structures and could not be sacrificed when-
ever the incandescent conductor needed renewal, and because, further, these lamps were of so low resistance as to require leading-in conductors of large size, which could not be satisfactorily and

permanently sealed into glass, first, because of the large size of these conductors themselves, and second, because of the undue heating which would result, it seems to me that I am entitled to say that the Geissler tube construction of chamber would not be applicable or useful in any of the said lamps.

When, however, Mr. Edison conceived for the first time the idea of making an incandescent lamp with a thread or filament of carbon of high resistance he made, in my judgment, a radically new departure in incandescent lamps. By making the said filament long and of small cross-section, he obtained an incandescent conductor of great flexibility which could readily accommodate itself without injury to the extreme changes of temperature to which it must be subjected. But what was more, he succeeded in conveying to the lamp in this way the necessary electric energy required to give the light in the form of a maximum of tension and a minimum of current; so that the leading-in wires of platinum could be made of small size and could be readily sealed into the glass satisfactorily and permanently. In this way, too, Mr. Edison succeeded in increasing very greatly the duration of the incandescing conductor; so that, by enclosing it in a comparatively simple lamp chamber, sealed by fusion of the glass, he produced a lamp entirely different in its fundamental features from those which had, up to that time, been used for lighting by incandescence, and a lamp in which, as it seems to me, the Geissler tube construction could be made use of for the first time to material advantage.

4 Q. You have stated in substance that it was not until a radically new departure had been made in electric lighting that the principles involved in the construction of the Geissler tube chamber were applicable to or useful in the construction of incandescent electric lamps. Please state where you find the new departure you refer to first disclosed? 857

A. The radically new departure referred to is first found, as I have already stated, in the incandescent lamp described by Mr. Edison in his patent No. 223,898, issued January 27th, 1880, and a popular description of which appeared in the "New York Herald" for December 21st, 1879. The principle of this lamp consists in the use of a hair-like incandescing conductor of high resistance, which can be brought to incandescence by a minimum of current, and can be enclosed in a simple glass chamber.

Cross-examination by L. E. Curtis, Esq.:

5 X Q. In your answer to question 3 you say that the old lamps to which you refer required leading-in conductors of large size, which could not be satisfactorily and permanently sealed into glass. How large platinum wires can, in your opinion, be satisfactorily and permanently sealed into glass?

A. That would require experiment to determine, as it seems to me. I do not remember to have seen platinum wires so sealed which were larger than a millimetre in diameter.

6 X Q. Do you think that a wire a millimetre in diameter is the

largest wire that could be so sealed in regular commercial work in making incandescent lamps?

A. I have never seen wire larger than this used in incandescent-lamp construction, and never as large as this, except in a single case. I should suppose that, if larger wire than this were used for the purpose, the seal would not be permanent.

7 X Q. Are you prepared to say that the seal would not be permanent if wires two millimetres in diameter were used?

A. I cannot say what the fact would be from experimental knowledge, but my judgment would be that under considerable ranges of temperature such a seal would not be permanent.

858 8 X Q. In your answer to question 3 you say that Mr. Edison succeeded in conveying to the lamp the necessary electric energy required in the form of a maximum of tension and a minimum of current. What is the greatest current strength which you would regard as coming within the minimum of current to which you here refer? Would ten amperes, for instance, come within your understanding of a minimum of current?

A. That would depend, as it seems to me, upon the use to which such current is to be applied. For some uses I should regard ten amperes as a minimum of current and for others not. What I meant to have understood in my answer referred to is simply this fact, that granting the total energy supplied to a lamp to be represented by the product of the tension, by the current strength lamps may radically differ from each other, even when they consume the same amount of energy to produce the same amount of light according as they require a large current delivered under small tension or a small current delivered under high tension. Thus, for example, incandescent lamps, like that of the patent in suit, and older lamps of essentially similar construction, being of low resistance, require, as it seems to me, a maximum of current with a minimum of tension for the same total output. While the lamps first described by Mr. Edison, and which, as I have said, seem to me to constitute a radical departure in incandescent lamps, differ substantially and materially from the older type of incandescent lamps in being at the other extreme of the scale and in requiring in consequence of their high resistance the maximum amount of tension and the minimum amount of current for the same output. If, for example, two incandescent lamps require each the same amount of energy to give their normal candle power, say sixteen candles, and if this energy be assumed as three watts per candle the total energy for each lamp would be the same, to wit, forty-eight watts. Now one of these lamps may be of high resistance and require say ninety-six volts of tension to operate it; in which case the current required would be half an ampere. The other lamp may be of low resistance and require only one volt of tension to operate it, in which case the current required would be forty-eight amperes. With reference therefore to the same total energy expended in these two lamps, I should say that the former was a lamp in which the maximum of tension and the minimum of current was employed, while the latter re- 859 quired a maximum current to a minimum tension; using these terms relatively of course. Since the size of the conductor varies as the square of the current strength it is obviously of the greatest advantage to convey the energy to the lamp in the form of tension and not in the form of current, and hence the lamp in which this was first done by Mr. Edison seemed to me to constitute a radical departure in incandescent lighting.

9 X Q. Would a lamp requiring less volts of tension than amperes of current not be within the scope of the alleged improvement made by Mr. Edison and defined in your answer to question 3, even if the leading-in wires were made of platinum and sealed into the glass and the seal was permanent?

Objected to as immaterial, irrelevant, the scope of Mr. Edison's patent not being in controversy here.

A. I should hardly call such a lamp a lamp in which for a given total consumption of energy required a maximum of tension and a minimum of current. Whether such a lamp would be within the scope of Mr. Edison's patented invention I am not prepared to say.

10 X Q. What was the least current strength you assumed in your answer to question 3 would be required by the old lamps to which you there referred?

A. I have never seen any results of experimental tests to determine the amount of energy which must be expended upon the lamp of the patent in suit, or of the older incandescent lamps in order to produce a given candle power, and I do not know
860 that any such tests have ever been made. These lamps, so
far as I have been able to ascertain, were not only of very low efficiency, but also of very low resistance, thus regaining the energy to be supplied to them in the form of current. Assuming the resistance of the lamp of the old construction to be an ohm, and the efficiency to be not below ten watts per candle, which, in the absence of any exact data, seems to be reasonable, I should suppose that the minimum current required by such a lamp might be about three amperes per candle.

11 X Q. What is the maximum current which you have assumed could be used with an incandescent lamp having platinum leading-in wires sealed into the glass and keep the joint permanently tight under the conditions ordinarily obtaining in the use of incandescent lamps?

A. I did not have in mind in answering question 3 any precise number of amperes either as a minimum current for the older forms of lamps or as a maximum for the present forms. My last answer must therefore be regarded as fair an estimate as I can make upon the data assumed. As to the maximum current which it would be safe to use with an incandescent lamp of the construction stated in the question it seems to me that this would be the current which a platinum wire of a millimetre in diameter could carry without undue heating; the size of wire which I supposed, in my sixth cross-answer, was the maximum permissible. I have not the data here to calculate what this current would be, but the calculation when made would give, as it seems to me, what the question calls for.

12 X Q. Is that the best answer you can give?

A. It is, under the circumstances.

GEORGE F. BARKER.

Affirmed to before me,

[L. S.] WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

It is stipulated and agreed that such of defendant's witnesses as have not already signed their *depositories* may sign them *nunc pro tunc* at any time within ten days.

861 40 WALL STREET, NEW YORK, *March* 19, 1889.

Mr. Curtis appears for the plaintiff; Mr. Griffin for the defendant.

WILLIAM P. WILSON, being duly sworn and examined as a witness in behalf of the defendant, testified as follows:

Direct examination by Mr. GRIFFIN:

1 Q. What is your name, age, residence and occupation?

A. William P. Wilson; age, 44; residence, Philadelphia; occupation, professor of the anatomy and physiology of plants.

2 Q. State your experience and qualifications for knowledge as to the intimate structure of vegetable matter.

A. I have been studying botany, which includes plant structures, or the anatomy of plants, since 1865. In 1874 I was appointed to a position in Harvard university, where it was my special work to care for the students in the anatomy of plants. In 1878, wishing to broaden my knowledge on the anatomy and physiology of plants, I went to Europe, and spent the greater part of five years in the universities of Göetingen, Berlin and Tübingen, in Germany, and Naples, in Italy, studying especially the tropical plants, so far as they could be cultivated in Italy. Since that time I have been actively engaged especially in the microscopic examination and study of vegetable tissues for the purposes of my profession. At the present time I am officially connected with the University of Pennsylvania, in Philadelphia.

3 Q. What special preparation, if any, have you made for the purposes of this examination?

A. I have visited the Edison Electrical Company's factories, examined the bamboo in all its stages and in its different conditions as brought from Japan; and have looked over the various 862 processes of manufacture of the part which is carbonized for the incandescent light. I have taken material to my own laboratory, and given it the most careful microscopic and chemical examination—in this way being able to make comparisons between this and many other substances. I have also made special examinations of numerous exogenous and of numerous endogenous woods and fibrous structures, with special reference to their carbonization for electric conductors.

4 Q. Are you acquainted generally with the principles of electrical science?

A. In a general manner, yes. I have made no special study for a number of years of the phenomena of electricity, or of electric science as it has grown up; but formerly, when interested in the study of certain currents which were discovered to exist in plants, I made some special studies of electrical resistance and of kindred subjects—I mean with special reference to plant structure.

5 Q. Using the word "fibrous" in its ordinary broad signification, as that which contains or consists of fibres, what proportion of vegetable substances are fibrous, and what classes of vegetable substances, if any, are devoid of fibre?

A. If one uses the term "vegetable fibrous substances" in its broadest sense it practically includes all vegetable growths, the number which are not fibrous being so small and of such an inconspicuous character that no ordinary person would think of them. I believe, taking the plant kingdom as a whole, there are but two or three very small groups which are not fibrous, such as the algæ and the fungi; but the group called "fungi" must be qualified to a certain extent, as even in this so-called family there occur numerous structures which might be called fibrous. I want to make one modifying statement. I do not mean to say that the number of individuals is small, for, in the algæ, they are extremely numerous, but largely microscopic, and the same may be said of the fungi—a larger part of which are microscopic and unicellular in structure.

863 6 Q. In the families of the algæ and fungi you have mentioned as being non-fibrous, what is the proportion of the solid matter, or residue, as compared with the watery tissue which would evaporate on heating?

A. If you mean the solid matter which would remain upon incineration, then, in many of the algæ, and also of the fungi, much the greater part would pass off in the form of vapor or water, and in many cases the percentage would run as high as from seventy-five to ninety-seven and a half per cent. of water.

7 Q. In the broad and ordinary sense of the words, is there, then, any substantial difference in the defining or limiting meaning of the expressions "fibrous vegetable material," as compared with the expression "vegetable material"?

A. In the general sense fibrous vegetable material would be taken to include all vegetable growths, the groups which are not fibrous being so inconspicuous, and the group of the families which are not fibrous playing no conspicuous part in the general vegetation of the earth.

8 Q. What, to your knowledge, is the great natural storehouse, or source of origin, of carbon or carbonaceous material?

A. I should say that it was the vegetable world.

9 Q. What class of vegetable tissue, as a rule, contains the largest

percentage of carbon, or of carbonaceous matter, in proportion to its original weight?

A. The exogenous plants would contain more carbon in proportion to their weight than the endogenous plants.

10 Q. Please describe, with as much brevity as is consistent with clearness, the general characteristics of the various tissues or fibres of an exogenous stem, so that the same may be understood, without unnecessary use of technical botanical terms?

A. The character of exogenous stems, of course, varies with each stem, and with the age or growth of the stem under consideration. In order to facilitate such description I have prepared a few plates and diagrams which I should like to introduce into
864 the evidence. Nearly all of our ordinary plants, forest trees
and common shrubbery, which naturally grow in this climate, belong to the exogenous group. In brief, the description of an exogenous stem may be the following: If one takes a cross-section of any ordinary exogenous stem there will always be a central zone of loosely arranged more or less spherical cells called the pith. In a circle surrounding this central pith will be found the so-called woody zone. On the exterior of this woody zone, around its whole circumference, is the growing or cambium layer. Exterior to the growing layer is found the bark or rind. The cambium or growing layer forms each year in our exogenous growths a layer of wood on its interior and a layer of the bark or rind on its exterior; thus the wood becomes thicker each year by this addition. This newly added wood is called the annular ring; the bark or rind is more or less complex, having in many growths one or more layers which are capable of adding to its thickness. In the early stages of the growth of any exogenous stem the cells which make up its primary form are all rounded and more or less spherical like the pith in the centre. All subsequent modifications into the wood and into the various modified cellular structures of the rind are modifications of this original so-called fundamental tissue; so that whether the product is ultimately called a fibre or a duct or a tube or a vessel, it all originates from the one form of round-celled tissue. Plate No. 1 shows a typical transverse section of an exogenous stem, and plate No. 2 a vertical section of the same very highly magnified. In plate No. 2 the row of cells marked *p* shows the fundamental form of cells. The various vessels or tubes lettered from *a* to *k*, which are found in woody structures proceeding from the centre towards the circumference, are made up of modifications from the original fundamental tissue called pith, either by growth of the original cells, or by the breaking down of the intermediate wall or partitions of certain of the cells, or by the perforation or thickening or marking of the original walls of the cell either before or after they have
865 coalesced to form a tube form. Thus we have in plate No. 2,
beginning on the left, *p* the original parenchyma or fundamental cell; *a*, an annular vessel made up of numerous original cells, the intervening walls having disappeared so as to form a tube, a portion of the walls having become thickened into ring-like interior protuberances; *b* is a similar vessel, only having different mark-

ings; *c* is another vessel which differs only in its markings; *d* represents a group of ordinary wood cells in which the walls have not been obliterated but have become much thickened and filled often with starchy or other materials; *f* represents a large dotted duct formed out of the original cells which have coalesced to make a tube, the walls of which have become thickened in dots or small circular rings. Next to this succeeds the growing layer, where the fundamental cell is again visible, these cells on the woody or inner side developing into the various tubes and cells described, and on the bark or rind side into the ducts or vessels which are peculiar to bark, and which are shown at *h, i, j* and *k*. The comparative size of these various cells, tubes, ducts and vessels, the thickness of their walls, their length, the nature of their contents, the peculiarity of their markings and their relative position, all vary in each exogenous wood, and give to that wood its recognized characteristics. In the same wood, at different ages, similar differences may be found. At one period of growth one tissue predominates which at another period almost disappears or becomes so altered or filled with foreign substances as to become almost unrecognizable. The differences between these various vessels and fibers when viewed under the microscope are as fundamental and widely divergent as it is possible to imagine. The minute characteristics of the vessels or fibers in one wood do not necessarily appear in what might be popularly termed similar fibres or vessels in another wood. The only visible differences of one wood from another have their counterpart and analogy in the microscopical differences of the cells or fibrous structure of the woods; and these differences can
866 only be ascertained by microscopical observation and study.

One peculiarity of exogenous stems is shown better in transverse section in plate No. 1 than in plate No. 2. From the central pith or fundamental cells of exogenous stems there run what are called medullary rays towards the circumference through the wood into the bark. In young wood these medullary rays are composed of the fundamental tissue; and this characteristic is preserved by the cells of the medullary rays however old the wood may be. That is to say, the cells of the medullary rays do not develop into ducts, vessels and tubes, but always retain their original character. In young stems the medullary rays form a means of communication for the sap or watery elements, enabling them to circulate from the growing portion to the pith. In older wood the cells of the medullary rays become so thickened and compressed that they are practically dead. The number of these medullary rays is extremely great, although varying in different exogenous stems. The cells of the rays as a rule run horizontally as to their longer diameter.

The various vessels, ducts, tubes and fibres of the wood proper are harsh and unyielding and have no commercial value for textile purposes when used alone. When treated by various acids or alkalis or by steaming processes, they may be reduced to a condition of pulp, in which it is possible to employ them in the manufacture of a common variety of paper.

The bark or rind, &c., may be separated into the epidermis, which is the outside portion and generally composed of round-celled tissues, the walls of which are generally very much thickened, and beneath which is a corky layer of prismatic cells. Beneath these are layers belonging to the living, growing round-celled tissues. Further in the interior come very much elongated cells with thickened walls, grouped more or less together in bundles, called bast cells, together with a few tubes, generally called sieve tubes from the fact that the horizontal walls or divisions of these tubes are perforated so as to somewhat resemble a sieve.

867 11 Q. What portion of the exogenous stems has it been and is it, customary to use for purposes of carbonization generally?

A. The only portion which can be successfully used for carbonization is the wood.

12 Q. What would be the effect of trying to carbonize an ordinary *o*xogenous stem having the bark upon the stem?

A. The cambium, or growing layer which separates the bark on the one hand, and the newly formed wood on the other, is mainly a pulpy mass, made up of thin-walled cells filled with fluid. The bark would at once separate from the woody portion. In the woody portion would be found most of the carbon, the bark containing very little. The bark is much looser than the woody tissue, less coherent, less compact, less adherent, more easily separated, and on carbonization would be apt to break up, having little coherence, and containing so large a percentage of water. As is well known, for all purposes of carbonization in the general use of *o*xogenous woods, the bark is stripped off the wood, and unless in the green trees, or in trunks of the raw material, the bark is not found. The bark has little or no use as a timber or wood; and so far as I know, the bark is never used for the purposes of carbonization.

13 Q. In attempting to carbonize green willow twigs, for example, what would be the effect of any process of carbonization known to you, upon the bark of the green twig?

A. The bark of the green willow twig, under the process of carbonization, would mostly disappear; but whatever was left would separate from the woody portion, warping away from it.

14 Q. What would be the character of the resultant carbon obtained from such a stem as a green *ye*llow twig?

A. In consequence of the water character of the bark, it would be an extremely spongy mass, the round-celled tissue almost wholly disappearing. In fact, the entire twig, wood and bark, of a growing willow twig would almost disappear, so great being the
868 proportion of watery material to solid substance—the cells
generally being very thin and immature, and only partially formed.

15 Q. What would be the effect, to your knowledge, of an attempt to pass an electric current along a filament or conductor of carbon made from a live green willow twig?

A. The thin-walled cells which had been left from the carbonization would be rapidly consumed by the current—there being always a greater resistance at points where these thin-walled cells occur.

16 Q. Have you prepared microscopic drawings of any exogenous stems in longitudinal and transverse section, to illustrate the characteristics of such woods when cut to size of the ordinary filament, such as used in the Edison incandescent lamp? If so, please present and describe the same?

A. I have cut and prepared such specimens from such woods as I thought would be poorest, and from such woods as I thought would be best for electrical conductors. The drawings I have taken from filaments of the wood, as nearly as possible approximating the size of the ordinary Edison filament—the drawing showing the appearance of the same magnified about 150 diameters. Plate No. 3 shows such a magnified filament taken from common whitewood (*Liriodendron tulipifera*), otherwise known as the tulip tree, and sometimes called the white poplar. The cross-section of the filament shows four medullary rays of short fundamental tissue. Between these lines of fundamental tissue are numerous openings, some larger and some smaller. These openings represent the cut ends of various vessels, ducts, and large wood cells, the markings of which will be seen in the longitudinal section. A A shows the medullary rays; B B some of the open vessels; and C C indicate some of the woody fibres. It will be readily seen that the medullary rays A A in the longitudinal section are cut across at right angles to the lines of their longer axes, a very great number of cells being cut across in each ray. In the portion of the filament shown in the 869 plate, a dozen to fourteen medullary rays are shown cut across, and as this only presents one surface of the filament, a much larger number are cut across and not shown; in addition to which it must be remembered that the microscopic section shows only a very short length of the filament. In an ordinary filament of three or four inches in length, the number of medullary rays cut into would number many hundreds, and each ray would be composed of a very large number of original cells. It will also be seen that there are numerous large vessels running parallel with the filament, making a very open tissue. The woody fibres, it will be also noticed, are caused to diverge from their parallel course in proportion to the width of the vessels B B and the size of the medullary rays A A. Where the vessels or the medullary rays separate the woody fibres the coherence of the fibres is very slight.

17 Q. Is the whitewood as represented by you in plate No. 3 a representative specimen of the ordinary exogenous woods?

A. It is a representative of one of the so-called softer woods. Such woods would present great ease of cutting and making to the required form, and, as well known, such woods are commonly prepared by carpenters for such purposes in preference to the harder woods which offer greater difficulty of manipulation.

18 Q. Please present a similar plate representing a magnified picture of a filament of willow.

A. Plate No. 4 represents such a filament, magnified about 150 diameters, in longitudinal and cross section. It will be noticed that in the willow filament the vessels are even larger and looser than in the filament of whitewood. In the filament as shown very few of the medullary rays are shown cut into. This happens because the filament is not a perfect tangential section.

19 Q. Please present a similar microscopic drawing of one of the harder woods?

A. Plate No. 5 represents such a filament, made of rock elm, one of the most valuable of known exogenous woods of our clime. It will be noticed that the wood fibre is very greatly turned 870 aside and caused to diverge from a parallel course, by the medullary rays, which are very large, and are composed of a large number of small cells. It will also be noticed that the edge of the filament is broken as regards certain fibres. This is the inevitable consequence of cutting a filament of such a wood, in which the fibres are sinuous.

20 Q. Is the rock-elm section as presented by you a typical section of the harder, close-grained exogenous woods?

A. It is. I specially selected this specimen for its hardness, and because it presented the best or the nearest analogue to bamboo stem, as used by Mr. Edison, known to me in exogenous woods, so far as the length and closeness of the fibre is concerned. It is an extremely favorable specimen in this respect of the general character of exogenous fibres, which are by no means so long or so close. The general exogenous woods would run between the specimen of white wood, representing the softer woods, and the rock elm, representing the hardest and closest-grained woods. I may state that in selecting the rock elm from which to make my station, I obtained the assistance of the first expert in the State of Pennsylvania in the selection of a most favorable specimen. I have a specimen with me of the rock elm, into which a wedge was driven some two years ago, and which will be seen preserves the tightness of hold upon the wedge up to the present day, the intricate interlacing of the tissue causing such tension as, notwithstanding shrinkage from changes of temperature, moisture, etc., still retains a firm hold upon the wedge.

"Said specimen is offered in evidence, and marked 'Defendant's Exhibit Wilson Rock Elm Specimen, March 19th, 1889.'"

21 Q. State from your experience what would be the effect of carbonizing exogenous woods of the various types presented by you, and especially what would be the effect of attempting to carbonize filaments of such woods for use in the Edison incandescent lamps?

871 A. The carbonization of specimens of willow and of white wood would result in rather a spongy heterogeneous carbon, for the following reasons: The medullary rays being made up of very thin walled cells, would partially disappear; the larger parallel vessels and ducts would leave open spaces from one end of the filament to the other, thus giving a very open, spongy mass; and the fibrous part of such filament would be very loosely attached together after the destruction of the connective tissue—the medullary rays.

22 Q. Would there be any uniformity of conductivity of an electric current in a filament formed of such wood?

A. The conductivity would vary in proportion as the texture of the carbon varied, which would be extremely great, there being the greatest differences between the vessel and the medullary rays. The willow and the white wood, in this respect, are almost identical.

23 Q. Please answer similarly as to the rock elm, taking that as a sample of the hardest exogenous woods most suitable for manufacture into a filament for an electric incandescent lamp?

A. A filament made from rock elm, on account of the interlacing of the fibres, is extremely tough and tenacious before carbonization; but the very qualities which make it tough and tenacious before carbonization will make it extremely friable after carbonization. The fibres interlacing are cut at short intervals, and under great tension. Upon carbonization this tension is relieved, and these short fibres would naturally fall apart. In addition, the large number of medullary rays, as shown in plate No. 5, would render the conductivity extremely varying. Long close woody fibres would be excellent conductors; but where turned aside for a medullary ray, the resistance would be greatly increased; such resistance would naturally cause an increased degree of heat; and the thinner-walled cells making up the medullary rays would burn away first; thus, in a very short time, destroying the filament. Thus, a filament which before carbonization is one of the very toughest which can be made out of any of our exogenous woods, becomes after carbonization extremely friable, and an extremely poor conductor for an incandescent lamp. 872

24 Q. Please answer the same questions as to the large class of resinous or hard woods of exogenous character.

A. Such woods are extremely durable for purposes of carpenter's work by reason of their resinous character, which resin would be volatilized and dissipated under carbonization; the residue of the woody carbonaceous matter would then be light and spongy, the more so by reason of the evaporation of the large amount of resin contained in the large cells. The weight of these woods as ordinarily used is due to the enormous amount of resin contained in the cells, which are filled up solid with the resin. If this resin is dissolved or evaporated out, the residue of the woody tissue is no greater than in other woods already mentioned of exceedingly low specific gravity. The resultant carbon therefore would be of the same class so far as their electrical qualities are concerned.

25 Q. I call your attention to the following statement in the patent in suit: "The advantages resulting from the manufacture of the carbon from vegetable fibres or textile material, instead of mineral, or gas carbon, are many. Among them may be mentioned the convenience afforded for cutting and making the conductor in the desired form and size, the purity and the equality of the carbon obtained, its susceptibility to tempering, both as to har-ness and resistance, and its toughness and durability." Please state whether to your knowledge these advantages are found in vegetable fibrous

material of exogenous growth—first, as to the convenience of cutting and making the conductor in the desired form and size.

A. It is true that great numbers of vegetable tissues could be very easily and readily cut, but equally true that such of these tissues as can be readily cut would be generally worthless for electrical purposes. As for illustration, the white wood (plate No. 3), and the willow (plate No. 4), both of which woods are very soft 873 because they are filled with large ducts and vessels containing air, between which is interposed much of the fundamental tissue. This fundamental tissue allows the vessels, ducts, and woody cells to be very readily separated. It also renders the filament after carbonization equally friable and spongy, and therefore comparatively worthless for incandescent purposes as shown by experience. It may be stated that even in such woods it is perfectly impossible to get a smooth exterior, because in forming even so small a conductor as a filament, a large number of medullary rays are cut across or broken into, and also numbers of vessels and ducts of considerable diameter open up on the surface of such filament, often only partially parallel to it. For example, in plate No. 3 it will be seen that three of the medullary rays are cut across on the outer edge of the one portion of the surface shown in the plate; and on plate 4 a large duct at B comes just at the outer margin of a filament; and on carbonization this duct would allow the extremely thin surface of the filament to collapse, forming a rough edge.

In the harder woods, such as the rock elm, the fibres interlacing and crossing each other, as can be seen in the specimen with the wedge in it, which I have presented, present a material which is almost impossible to cut into straight even filaments; but when cut, as previously stated, there would be so many cross-fibres and cross-cuttings of interlacing fibres that the filament would have almost no adherence after carbonization. In very many woods (as for example in the specimen of curly maple which I present as a part of this my answer) the fibres are so wavy that they would almost be cut at right angles in short distances in any filament, so that even before carbonization there would be no coherence of the fibres. It would be like cutting a filament at right angles with the ordinary grain. Thus it will be seen that the very quality of toughness, apparently so desirable, becomes the main reason of the electrical destruction or inefficiency of the filament.

Next, as to the purity and equality of the carbon obtained. 874 The equality of the carbon, as opposed to the purity, must mean equality of structure, the lack of which is the distinguishing characteristic of ordinary vegetable carbon. The varying sizes and proportions of cells, ducts, tubes and fibres, the different thicknesses of the cell walls, the interlacing and crossing of the medullary rays, fibres and ducts, and the differing density of each portion of the wood, all tend to render the resultant carbon extremely heterogen-ous. The purity of the carbon also varies very greatly with the character of the vegetable structure. In the willow we have as a result of carbonization probably one of the purest carbons. A very careful analysis, made expressly for this examination, enables me to state that 100 parts of ordinary white willow contain only .42 of one per cent. of ash or foreign matter. It is for this reason that the willow charcoals are generally selected for the manufacture of gunpowder—on account of their extreme purity. In other words, the ash constituents are very much greater, consisting of salts of silica, potash and other mineral substances, varying with each wood. It will be noticed that the purest forms of carbon are obtained from such woods as willow, which are the least adapted for electrical use in an incandescent lamp. The woods of harder fibre contain more impurities in the form of residue ash, and owe more or less of their hardness in many cases to the presence of foreign matter. As an extreme instance of this it may be mentioned that certain woody substances contain so much silica that they have been used as edge tools or swords.

As to the question of tempering vegetable fibrous material, so far as it relates to its electrical resistance, I have had no experience, and therefore cannot state.

As to the question of toughness and durability, it has already been incidentally treated by me in my discussion of the heterogeneous nature of the wood tissues. All the exogenous woods known to me would make carbons which are by no means tough or compact. If, by durability is meant durability as an incandescent burner, the
presence of medullary rays, the interlacing of the fibres, and
875 the other characteristics of exogenous stems mentioned by
me, would, in my opinion, tend to produce a great variation of strength of the electric current in different parts of the carbon conductor, and so an unequal strain upon these different parts, and the speedy destruction of one part and the consequent disintegration of the filament.

26 Q. Assuming that a substantial equality of resistance is necessary in a carbon filament for use in an electric lamp, do the fibres in exogenous woods present such an equality, or, by reason of their existence, increase or aid such an equality in a carbon conductor?

A. I should think that from the nature of the general structure in exogenous woods, they would not aid such uniformity of conduction. The presence of fibrous ducts or cells implies a difference of structure, and consequently a difference of electrical conductivity. Even were the entire tissue fibrous, the existence of separate or differing fibres implies a difference of structure, and consequently to the extent of such difference, a variation of electrical conductivity. Each fibre has its wall or boundary line, and is separated more or less appreciably from its neighboring fibre which implies a variation of density, and consequently a variation of electrical conductivity. Fibres are also more or less infiltrated in their cell walls with different substances, so as not to be uniform one with the other in these respects; and according to such difference there will be a consequent difference of density, and so of electrical conductivity.

27 Q. Turning to endogenous stems, please describe their generic character.

A. Plate No. 6 (which is a cross-section of common Indian corn) is a typical illustration of an ordinary endogenous stem. The great mass of cells shown in such section is made up of round-celled, fundamental tissue F; among which are scattered numbers of what are termed fibre-vascular bundles, *g*; such fibro-vascular bundles are composed of spiral ducts C; and annular or ringed vessels, D; and a mass of surrounding small-celled tissue E, made up of bast cells, with more or less woody fibre. These bundles are called 876 fibro-vascular bundles, because in them are united on the one hand the elongated cells, which are the true fibrous cells, and the very much elongated and variously marked vessels. Towards the circumference of the stem it will be seen that the bundles become more numerous. At A and B are shown the epidermal layers. In endogenous stems there is no true bark. The increase in growth is formed by fibro-vascular bundles becoming interpolated in the fundamental tissue between the already existing bundles. Such stems do not increase in diameter, but are formed of the original size from the terminal bud. They grow harder and firmer according to the increasing number of fibro-vascular bundles, or various changes in the bundles and tissues already existing. This increase of fibro-vascular bundles is not continuous, but terminates at a period varying in different plants.

Plate No. 6 is a farly typical example of the ordinary endogenous structure. It will be easily seen that in cutting a vertical section it would depend entirely upon where the section was made, whether any of the fibro-vascular bundles were included in the surface of the section or not. The majority of the tissue in such section would be the short round-celled fundamental tissue, with here and there a portion of the fibro-vascular bundle shown in long and nearly parallel lines. The fundamental tissue is less prevalent towards the circumference than at the centre, in consequence of the greater number of fibro-vascular bundles.

28 Q. What would be the character of the carbon resulting from the carbonization of the ordinary endogenous stem?

A. In the great majority of endogenous stems the fundamental tissue largely exceeds in bulk that of the bundles; and any filament for electrical purposes cut from such stem would necessarily include one or more of the bundles, and a mass of the interwoven fundamental tissue. Upon carbonization such fundamental tissue, being thinner walled and with much less substance, would present naturally much less carbon; and form an open spongy mass between the fibro-vascular bundles. 877 The bundles also would vary very much in density in proportion as they neared the centre of the stem or the circumference, those in the centre of the stem being more vascular (that is to say, having larger air space) than those near the circumference, which would be made of a more compact fibre. These large air spaces would offer great irregularity of conductivity in different portions of the cross-section of a filament. Such filament carbonized from any ordinary endogen would lack necessarily compactness, as the mass of it would be made up of these round-celled fundamental tissue. The surface of it would be very rough, and would present a perfect honey-combed appearance, except where the fibro-vascular bundles happened to lie on the surface. As I understand it, this honey-combed character of the outside of the filament would tend to the rapid destruction of the filament by the electric current. In addition, the variations of thickness in the cell walls of the fundamental tissue present great differences of electrical resistance, especially as compared with the resistance of the fibro-vascular bundles. Consequently, the surrounding fundamental tissue, where resistance is greatest, soon burns out, and the life of the filament is destroyed. This I know from microscopic examination of short-lived filaments that have been subjected to the electric current. The microscope showed me that the fundamental cells in such filaments had been destroyed, or had become of so spongy a character that the walls might be said to have melted away and disappeared. They had the appearance of having melted up at the edges. Of course this was a destruction of a large portion of the cross-section of the filament and would throw the entire strain of the current upon the remaining small portion of the filament, tending to the speedy destruction of the filament. This would be the necessary consequence with nearly all endogenous stems known to me.

29 Q. Please describe the structure of the bamboo stem, 878 and state what differences, if any, there are in the structure of that stem and the ordinary endogenous stem already described by you?

A. For the purposes of this examination I have made a special study of bamboo stems, in addition to the general prior knowledge that I had on the subject. I present three plates, Nos. 7, 8 and 9, made from microscopical sections prepared by me. No. 8 is the cross-section of the ordinary adult bamboo stem; No. 9 is a longitudinal and cross section of an actual filament of the Edison lamp, obtained by me at the Edison lamp factory. The difference found to exist between an ordinary endogenous stem in cross-section and that of the bamboo may be briefly stated to be the following: The fibro-vascular bundles, taking on equal surfaces, are greatly increased in number in the bamboo. This is especially so as one approaches the outer margin of the stem. The fibro-vascular bundles as they approach the circumference lose a part of the woody tissue, which is replaced by bast, so that the bundles near the circumference are almost wholly made up of bast. Again, the round-celled fundamental tissue, which made up most of the surface in the section of corn, becomes greatly reduced between the bundles of the bamboo. This reduction goes still further as one approaches the circumference of the stem, until between many of the bundles, which are almost wholly bast, there is but one layer of cells of the fundamental tissue, and in many cases the bundles are not separated by any of the original parenchyma or round-celled tissue; but a still further change takes place in the fundamental tissue which exists between the bundles. The walls have become very much thickened, thus resembling the bast cells which it separates. The inner layers of the epidermis have also become transformed into bast. In the old stem of the bamboo we have, therefore, a zone extending completely around the stem, near the outer margin, which is almost made up of solid bast cells. Again, the bast cells, which in the corn or in most endogens are hollow, with quite large openings, in the bamboo becomes closed and nearly solid.

This gives practically a zone near the circumference of the
879 stem of the bamboo, which is made up of almost solid bast
cells. These bast cells are shown well in the cross-section at A of the filament on plate No. 9, in which it will be observed that the cell walls have become so thickened that each cell may be said to be almost absolutely solid, the slight ring marked at the centre being the only trace of an opening. It will also be observed that the bast cells are close approximately one to the other—so close, indeed, that they may be said to form practically a solid rod or mass. This bast zone of which I have spoken is shown in the diagram in plate No. 8 as A A.

30 Q. What difference, if any, exists between the adult bamboo stem and the young green bamboo stem?

A. Plate No. 7 is a cross-section of a green bamboo stem cut by me, the stem being only six weeks old. Here the bundles are separated by a much wider layer of the fundamental tissue. They are less separated as you approach the margin. The bast in the bundles is thinner walled. The epidermis, instead of two or three layers of cells, contains six or seven, the inner ones of which will later be developed into bast. These different epidermal cells are marked respectively E and E^1; the layer of bast which, by consolidation and crowding, later becomes the bast zone spoken of in the adult stem, is marked A A, and the intervening fundamental tissue is marked B.

31 Q. What has been your acquaintance with endogenous stems?

A. I have examined hundreds and even thousands of them.

32 Q. Do you find the equivalent of the zone A A in other endogenous plants; or how far, if at all, is the same peculiar to the bamboo?

A. I find the same peculiarity to a certain extent in some other stems, but never, so far as I know, approaching the extreme condition found in the bamboo. In all endogenous stems the bundles tend to become more crowded towards the circumference, with less intervening fundamental tissue, but I know of no stem
which includes such a combination of characters form-
880 ing this almost solid zone of bast as is found in bamboo.
These characters are in combination: (1) an increase in the bundles towards the margin; (2) the compressing of the intervening parenchyma by elongation and thickening of the adjacent cells; (3) loss by transformation of certain vessels in the fibro-vascular bundles, which, as they approach the margin, becomes almost wholly bast; (4) the solidifying and thickening of the walls of the bast cells; (5) either the total loss of the intervening parenchyma or the thickening of its walls, so that it resembles bast. This combination, taken as a whole, is, so far as I know, unique, and found only in the bamboo. Some of these qualities will be found in some stems

and others in other stems, but as a whole I know of no stem that carries this combination to such an extreme. In fact, this zone of bamboo, with its compact bast cells, mitred end to end and firmly adherent upon the adjacent sides, forms a tissue which more nearly resembles a metal wire in its continuity than any other tissue known to me. As illustrating the substantial identity of tissue resulting from this solidity, I may mention that, in splitting the bamboo lengthwise, the splitting will often split the bast cells in halves, instead of separating one fibre from another, thus showing that the cohesion of the separate bast cells is equally strong with the internal cohesion of the particles forming the cell wall. In other words, there is a substantial identity of cohesive force in all parts of the structure. These bast cells are practically parallel, as shown at A in plate No. 9. It will be observed in the cross-section of plate No. 9 that there are shown two rows of fundamental tissue in the entire cross-section of an actual filament. It may well happen in many filaments that there will be absolutely no fundamental tissue in the entire width, but that the same may consist entirely of bast cells. Of course in manufacturing filaments care should be taken in the selection of such filaments as contain the least amount of fundamental tissue. The effect of such a structure is to give great uniformity in electrical conductivity or resistance—the bast cells
881 being substantially identical one with the other, and so closely
adherent as to become practically continuous, thereby causing no difference of electrical resistance worth mentioning, except where the fundamental tissue may be present; and in these the electrical resistance more nearly approximates to that of the bast cells by reason of the enormous thickening of the cell walls. This zone is the closest approximation to a solid homogeneous conductor known to me in the vegetable kingdom.

33 Q. Is there any analogy or similarity between this zone of the bamboo and the substance of paper of any kind known to you?

A. There is no analogy whatever. Any ordinary paper which is made from wood pulp, or vegetable material, is composed of fibres purposely separated and rendered disassociated to the extreme. In matting these fibres into the paper substance the object of the paper-maker is to make the direction of the fibres as heterogeneous as possible, in order to give tenacity to the paper. If the fibres in the paper were parallel, the paper would have no tenacity. In addition, paper necessarily contains fibres of all character; also vessels, ducts and tubes; and necessarily these fibres are more or less broken, macerated and torn; and they present numerous loose ends prominently on the surface of the paper, which appearance it is a part of the art of the paper-maker to hide by loading the paper with filling substances, generally of a mineral character; and, as a consequence, the defects mentioned as belonging to exogenous woods, as to variations of texture, density and electrical conductivity, are excessively exaggerated in a carbonized paper filament. With the exception of the fact that bamboo is of vegetable origin, there seems little or no connection or association in any way between such a substance as paper and the particular zone of bamboo mentioned by me, and which I understand is the zone selected by Mr. Edison, after long experimenting, for the manufacture of carbon filaments for his lamps.

882 34 Q. What would you have understood, and what was commonly understood in the art by "wood carbon or charcoal" on January 9th, 1880?

A. I should say without hesitation that it meant charcoal from any one of the ordinary exogenous woods.

35 Q. Would the use of such expression have suggested to your mind carbonized bamboo as one of the carbons or charcoals usually included in the phrase?

A. The bamboo, being one of the grasses, and the grasses, as we ordinarily know them, having generally quite pliable hollow stems, the bamboo would have been almost the last plant I should have thought of. Really I never would have thought of the bamboo at all. It would never have entered my mind. If I had had my attention called to it, but without giving it special attention, I should have thought that anything from the grass family would be worthless as a carbonized filament or conductor for an incandescent lamp.

36 Q. As matter of fact, exclusive of the use of bamboo for the manufacture of filaments for incandescent lamps, have you ever known of its use as a substance for procuring wood carbon or charcoal?

A. I have never heard of bamboo, nor of any nearly allied structure being used to make charcoal.

37 Q. What percentage of impurity exists in bamboo stems, as compared for example with the impurities you have mentioned in the willow?

A. By careful analysis made in the organic laboratory of the University of Pennsylvania of that part of the stem imported especially for the filament, I have found it to contain 6.42 per cent. of earthy impurities, of which 6.2 per cent. is silica and 0.22 of one per cent. potash and other substances. The excessive amount of silica in bamboo is known to exude into the hollow of these stems in the form of a hydrated silicate of soda, which is known in the arts as tabaschir, a well-known substance in materia medica in the Orient, and sold in the form of small rolls, in which form it is naturally moulded in the hollow stems. This substance is peculiar, in that it possesses the lowest refractive index know- of any 883 substance. In appearance it is glassy in structure, and, in fact, is called a natural glass; containing from fifty to sixty per cent. of water, the rest being silica.

38 Q. Is any species of bamboo native or indigenous to the United States, or so far as you know grown here?

A. None of the species of bamboo grows normally in the United States. Of course, it is cultivated in various greenhouses for botanical or decorative purposes. The bamboo grows naturally only in tropical or subtropical countries.

THURSDAY, *March 21st*, 1889.

Met pursuant to adjournment.

Present: Counsel as before, and the examination of Prof. Wilson proceeded as follows:

Cross-examination of Prof. WILSON by Mr. CURTIS:

39 X Q. Were the various peculiarities of structure and chemical composition of vegetable substances referred to in your answers to questions 5 to 10 inclusive, and 16 to 20 inclusive, and in question 27 well known prior to 1880?

A. It may be stated in a general way that much of the information given in these answers was known to plant anatomists in 1880, but not all. The special study of forest woods with reference to durability is at the present time in active progress. More specialists interested in woods, timbers and forestry are at work on these questions now than ever before. Again the same may be said for the anatomy of plants, and when any new fact is discovered, it may change or throw new light on all that went before it. With special reference to question 27, it may be said that not only have numbers of new endogens been discovered since 1880, but it is impossible to pick up any of the numerous technical journals of plant anatomy and not find special topics worked out at the present time which had not been touched before 1880. 884

40 X Q. What substantial or material part of the information given in your answers referred to in the last question was not known and published prior to 1880?

A. Understanding that the question refers to the anatomy and physiology of vegetable structures generally irrespective of the recognition of their adaptability for electrical purposes, I would say that the general features of endogenous and exogenous structure so far as mentioned by me in the answers referred to were published and known to students of vegetable anatomy prior to 1880. In question 19, I have referred to the effect of cutting filaments from tough and hard woods. Prior to 1880 there had been no study with reference to the effect of cutting small filaments from such woods, so far as I know.

41 X Q. Was there any substantial or material part of the information referred to which was not known and published prior to 1880?

A. Understanding the question as in my previous answer, I should say no.

42 X Q. Is not the family of algæ referred to in your answer to question 5 an extremely large one?

A. Numerically considered, that is, with reference to the individuals, it is immense, but less conspicuous than almost any other group of plants because confined mostly to the water and, second, because the great majority of the individuals are microscopic and unicellular.

43 X Q. It embraces the greater part of marine vegetation, does it not?

A. It comprises nearly all the submarine vegetation, but the

conspicuous marginal plants in salt-water marshes which are generally overflowed with the tide do not by any means, as a whole, belong to this order. Most of them do not. The great majority of the plants belonging to this order are inconspicuous either from
being covered with water or their microscopic nature.

885 44 X Q. Taking the algæ and fungi together should you
say that either numerically or with respect to the total mass of all the plants, these two groups form a very inconsiderable part of the total vegetation of the earth?

A. Numerically they are very great, but mostly microscopic and inconspicuous. The number of species of both fungi and algæ which can be seen and handled under the naked eye is not large compared with the rest of vegetation. The bulk or mass of sea vegetation is naturally large.

45 X Q. Were the characteristics of fungi and algæ mentioned in your answer to question 6 known prior to 1880, or have they been discovered since?

A. I should say substantially known before that time.

46 X Q. Was the relative amount of carbon contained in exogenous and endogenous plants mentioned in your answer to question 9 known prior to 1880, or has it been discovered since?

A. I should say substantially that was known before 1880.

47 X Q. Were the effects of trying to carbonize an ordinary exogenous stem having a bark upon the stem, mentioned in your answer to question 12, known prior to 1880, or have they been discovered since?

A. Known before.

48 X Q. Were the effects of attempting to carbonize green willow twigs and the character of the resulting carbon, referred to in your answers to questions 13 and 14, known prior to 1880, or have they been discovered since?

A. Known before.

49 X Q. Was the effect of an attempt to pass an electric current along a filament or conductor of carbon made from a live green willow twig, referred to in your answer to question 15, known prior to 1880, or has it been discovered since?

A. What knowledge may have existed on this subject before my own examination of such tissues was made I cannot state. From
my own examinations all thin-walled parenchymatous tissues
886 are destroyed first when passing an electric current through
such conductor.

50 X Q. Are you prepared to say that any person familiar with the principles of electrical science, as it existed prior to 1880, would not have been able to predict this result with certainty?

Objected to as incompetent and immaterial.

A. I should say that one could predict nothing of the kind; that such matters rest upon experimental knowledge.

51 X Q. What experience have you had in the making of carbon filaments for incandescent lamps from exogenous woods?

A. I have made a great number of filaments for carbonization out of a variety of different woods. I have studied the effect of carbonization on different structures.

52 X Q. Have you used or attempted to use any of these filaments in electric lamps?

A. I have never used any filaments of my own make in electric lamps. I have, however, studied under the microscope with great care numbers of the filaments which had been tested and burned out, that is, filaments which had had various life-lengths, which were given me by the Edison Company, or rather from the man who was at work in the testing-room of the lamp factory. Filaments not burned out but which had had a remarkably long-life period were given me to compare with others which had lasted longer and shorter periods, in order to get at the reason for the varying life-lengths.

53 X Q. How large were these filaments?

A. I had various sizes corresponding to the ordinary sizes used in the Edison electric lamps of different candle power.

54 X Q. Were any of them as much as a thirty-second or a sixty-fourth part of an inch in diameter?

887 A. I should say that some of them were less, and that some of a very high candle power were more, but for absolute accuracy I must refer to my assistant who made measurements.

55 X Q. Do you know how they were carbonized?

A. I do not.

56 X Q. Have you ever carbonized any conductors for incandescent lamps made from wood by the process described in the Sidot article in evidence herein?

A. I have not.

57 X Q. Have you ever carbonized anything by that process?

A. I have not.

58 X Q. Have you ever tried any experiments with carbons made by that process?

A. I have not.

59 X Q. Were the general peculiarities of structure of the bamboo stem and its differences in structure from ordinary endogenous stems and exogenous woods, as set forth in your answer 29, known prior to 1880, or have they been discovered since?

A. The general anatomy of the bamboo stem considered as a grass, was known prior to 1880. Some of the special peculiarities to which I have called attention in the stems given me for examination by the Edison Company do not exist in all bamboo stems or species, and so far as I know, I have called attention to them for the first time.

60 X Q. To what special peculiarities do you refer?

A. I refer to a peculiarity of the special kind of bamboo given me at the Edison factory, caused by a combination of anatomical characters. This peculiarity is the extreme consolidation of a zone of bast cells in the outer circumference of the stem, and caused by the five anatomical characteristics in combination, set forth in my answer to question 32.

61 X Q. Do you mean by the part of your answer to question 32,

you have just referred to, that you do not find this combination at all in other stems, or that you do not find it so perfectly developed?

A. Some one or more of these five combining circumstances may occur in any endogenous stem, but without the combination
888 of all of them in the extreme no such solidified zone of bast cells could be produced as is found in certain specimens given me for study. It is a very common characteristic in endogenous stems to have the bundles increase toward the circumference, and for the relative amount of bast to increase in said bundles, and also to find a diminution of the connective tissue between such bundles, but in combination with these circumstances to have the connective tissue, where it remains between the bundles, thicken its cell walls until it resemble the adjacent bast cell is not a common characteristic to be found in combination with the others. The extreme of each one of these conditions makes the peculiarity of this species of bamboo.

62 X Q. Was it known prior to 1880 that the fibres of bamboo were parallel to each other?

A. If in this question the fibre vascular bundles are referred to in the general stem, it was known that they were not absolutely parallel. If, however, the reference is to the bast cells in the particular zone of which I have been speaking and from which the Edison filaments are made, I think there had appeared prior to 1880 no special printed matter on this subject. This zone, from which the Edison filament is taken, is made up almost wholly of bast cells which for any short distance would be called practically parallel as shown in plate No. 9, which is very highly magnified, and slight deviations from parallelism are shown.

63 X Q. Bamboo is a fibrous vegetable material within the ordinary signification of that term, is it not?

A. Bamboo would ordinarily be considered a fibrous plant.

64 X Q. Is it not a fact that the particular zone of the bamboo to which you have referred was recognized in the arts as having peculiar strength, density of structure, elasticity and parallelism of fibre and had been used for many years prior to 1880 where these qualities were of advantage, as for instance in the manufacture of what are known as split-bamboo fishing rods?

A. I do not think that this very thin special zone of which
889 I have spoken would be recognized in this way upon careful experimentation. It is the zone just underneath this which, from the fact of the slight separation of the bundles by softer tissues, would be more elastic. In scraping off the so-called rind for manufacturing purposes, I think the particular bast zone of which I have spoken was mostly scraped off with it. The bast cells forming this zone are filled almost solid and are more brittle than the bast structures in general for that reason.

65 X Q. Do you mean to be understood by your testimony on the direct examination, taken as a whole, that there is no vegetable material except the particular kind of bamboo used by Mr. Edison from which good carbon filaments for incandescent lamps can be made?

A. I think the finding of an excellent conductor for an incandescent burner has been the result of a very long series of experimental investigations, and as it rests wholly on an experimental basis I do not believe it possible to say whether another equally good or better conductor or filament may or may not be found. In remote regions like the interior of South America or some parts of Central Asia or Central Australia, we are constantly adding new species of plants and it would be impossible to say that some of these may not furnish equally good material when known.

66 X Q. Suppose this particular kind of bamboo were not known, do you think that it would be impracticable or especially difficult to make commercially useful incandescent lamps with carbons made of any of the other vegetable materials known to you?

A. From my knowledge of other vegetable structures in general I know of no exogenous woods from which incandescent lamps could be manufactured anywhere near approaching in value those made from this particular species of bamboo. In the endogens to which this particular species of bamboo belongs I know of nothing else equaling this. I have no doubt but what lamps might be manufactured from some of the other nearly related species of bamboo which would be of value, but so far as my knowledge of their anatomy goes, not of equal value with the one in question.

890 67 X Q. Do you agree with the following statement made by Mr. Edison in his patent No. 251,540 on the bamboo carbon, which has been put in evidence by the defendant?

"In incandescent electric lighting I prefer to use for the incandescing conductor a small slip or filament of carbon bent into a curve, now generally designated the horseshoe carbon. Great success has attended the use of such carbons made from a naturally fibrous material capable of carbonization, for instance, wood formed into proper shape and then carbonized."

The particular point to which I call your attention is the great success obtained with wood.

A. I should say that in rating the value of any known wood, whether it be from exogenous or endogenous growths, the value of the same for the manufacture of an incandescent light would depend naturally upon a combination of anatomical characters, that the proportionate value would depend especially upon parallelism of the fibres, upon the solidity of the cells making such fibres, and upon the compactness of these special fibres or cells into a solid body. The solidity of such fibrous cells might exist in exogenous woods from the deposition of gums and resins of other substances in the vessels or air spaces or ordinary woody structure. Such solidification of fibres from such causes would not, in my judgment, make good incandescent burners. The fibrous tissue must be solidified in a way which would not be rendered loose and spongy through heat. I do not understand whether when Mr. Edison speaks of "wood formed into proper shape" that he means particularly exogenous woods. I should say from my experience that there is no exogenous wood which would equal in value for the manufacture of lamps some of the endogenous woods.

68 X Q. Is not this a fair statement of the facts as you understand them, that of the various vegetable growths with which you are familiar some are, by reason of their structure, not adapted for
making carbons for incandescent lights, and that the rest have
891 varying degrees of availability for such use up to the particular kind of bamboo used by Mr. Edison which you consider the best adapted of all for such use?

A. It has been proven by experimentation that certain vegetable tissues make poor conductors for incandescent lamps, that others are better and that others still are the best we know. Experimentation has shown I think that up to the present time bamboo, this particular species, is the best substance known for the manufacture of incandescent lights. In examining automatically the structures which have so far been tried the reasons can readily be stated.

69 X Q. Is it not a fact that different specimens of this particular species of bamboo differ from each other materially in their adaptation for making carbons for incandescent lamps?

A. I have not the slightest doubt but what this species would vary to a certain extent in its adaptability for this purpose under the influence of different seasons of drought or rainfall or as to the location in which it might be cultivated. It is one of the facts well known to experts who have to select timber for toughness and durability that the same species vary very much in accordance with the location or growth. Wood formed in excessively favorable seasons when the growth is rapid in any given species is always harder and tougher than wood of similar species grown under unfavorable conditions. Where the growth is slower and in this particular species of bamboo under consideration as in every species of bamboo, any material taken from near the terminal bud would be poor in respect to characteristics sought so that without this experience poor filaments for carbonization might be made from a stem in which certain zones were excellent.

70 X Q. Then in order to secure the best results it would be necessary, would it not, to make a proper selection of the bamboo even assuming this particular species to be used?

A. Yes.

892 71 X Q. So far as structure is concerned what is the general characteristic common to all vegetable materials?

A. Cellular structure.

72 X Q. So far as chemical composition is concerned what is the common characteristic of all vegetable substances?

A. Cellulose is one of the common characteristics.

73 X Q. Is not that the principal one?

A. No, sir; protoplasm is equally important.

74 X Q. In the analyses you refer to in your answer to question 37, how did you separate the earthy impurities from the rest of the material?

A. It was probably done by incineration. I did not do it myself at all. I took it to an expert in chemical work to do.

WILLIAM P. WILSON.

Sworn to before me,
[L. S.] WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

Defendant's counsel offer in evidence the nine plates or drawings numbered one to nine inclusive, referred to by Professor Wilson in his testimony, and the same are marked Defendant's Exhibits Wilson Drawings March 21st, 1889.

Defendant's counsel offers in evidence the specimen of curly maple, referred to by Professor Wilson in his answer to Q. 25, and the same is marked Defendant's Exhibit Wilson Maple Specimen, March 21st, 1889.

893 NEW YORK, *March* 19, 1889.

Met pursuant to agreement.

Present: Mr. Dyer, for defendant, and Mr. Curtis, for complainant.

WILLIAM HOLZER, being called and duly sworn, testifies as follows:

1 Q. What is your name, age, residence and occupation?

A. William Holzer; am in my 45th year; I reside at Menlo Park, New Jersey; I am superintendent of the Edison Lamp Company at Harrison, New Jersey.

2 Q. Are you a practical glass-worker? If so, how long have you been one?

A. I am. I first started in the business in 1859; first started as a boy to learn the business. I worked up till 1866 and then started business for myself and continued until 1879. In 1880, in January, I engaged with Mr. Thomas A. Edison at Menlo Park in the capacity of an expert glass-blower, and since that time I have had charge of the glass-work of his lamp factory.

3 Q. I call your attention to the patent in suit, No. 317,676, granted May 12, 1885, and particularly to figure 5 of the drawing. Please state whether or not, in your opinion as a practical glass-worker, it would be practically feasible to seal the glass plate *y* to the flange *x* of the glass lamp chamber by fusing the glass part together.

A. It would not be feasible.

4 Q. Do you think it could be done with any degree of success?

A. I do not.

5 Q. Would it be practically feasible, in your opinion, to seal into the glass plate *y* the metal tubes which are shown as passing therethrough by fusing the glass upon such tubes?

A. It would not be feasible.

894 6 Q. Do you think it could be done with success, assuming such tubes to be made of platinum?

A. I do not.

Cross-examination :

7 X Q. Where was your place of business from 1866 to 1879?

A. I first started at 430 Market street, Philadelphia, in January, 1866. I remained there about one year. From there I moved to 527 Minor street; remained there until about 1873; then moved to 1128 Market street, Philadelphia. I remained at manufacturing till about 1878 and then closed out business and took an office at 1126 Market street for a short time closing up my business affairs.

8 X Q. What was your business from the time you closed up your glass-blowing business till the time you went into Mr. Edison's employment?

A. From the time I closed up business until January, 1880, I didn't do anything—any business.

9 X Q. Did you do any work for Mr. Edison during that time?

A. No, sir.

10 X Q. What was the general nature of your glass-blowing business?

A. Manufacturing glassware for all purposes—druggists, chemists; glassware for philosophical purposes and general experimental work, making things by blow pipe, bench-working by blowpipe.

11 X Q. Did you make any Geissler tubes or radiometers during that time?

A. I constructed the glass-work for those instruments.

12 X Q. Were the Geissler tubes frequently made out of two or more different parts?

A. They were.

13 X Q. How did you make the joints between the different parts?

A. We take the different parts—we first construct the dif-
895 ferent parts, then subject them to the heat of the blow-pipe
flame, and then manipulate them until they are joined.
After they were joined we would take them and anneal them.

14 X Q. Were they joined by fusing the glass of the two parts together?

A. They were.

15 X Q. What was the reason for making that kind of a joint?

A. To make it air tight, so that after a vacuum is produced there wouldn't be any leaking.

16 X Q. Were the Geissler tubes you made provided with electrodes for getting an electric circuit through the tubes?

A. Well, we would take a piece of a platinum wire and seal it in at the end—well, first we would take the piece of platinum wire and partly cover it with aluminium, then join a small piece of glass on the platinum by fusing it onto it, and then we would insert the platinum wire which was partly covered with the aluminium, then insert it through a tube or bulb with a hole drawn to receive it, then we would subject it to the flame of the blow-pipe and melt the two parts together and then anneal them.

17 X Q. What was the purpose of making that kind of a joint between the platinum wire and the glass of the Geissler tube?

A. To make it air tight after the vacuum is produced.

18 X Q. Were these tubes intended to have a vacuum produced in them?

A. Yes, sir.

19 X Q. How were the tubes attached to the pump for producing a vacuum in them?

A. I have never done the exhausting of the tubes; I have had that work done outside of my factory. I have seen it done at the University of Pennsylvania. There were small tubes placed on the tube that was to be exhausted, and these small tubes were sealed to the pump.

896 20 X Q. How were these small tubes attached to the Geissler tubes, and how were the small tubes sealed after exhaustion?

A. They were sealed on by fusing together, and aftey they obtained the proper degree of exhaustion the small tube which had been contracted to a neck beforehand was sealed off by applying the flame of an alcohol lamp to the contracted neck and fusing the glass part together, closing the opening by fusing the glass.

21 X Q. Did you make the radiometers in the same way in which you made the Geissler tubes?

A. I constructed the glass parts only.

22 X Q. Were these usually made out of two pieces of glass?

A. They were made out of several pieces of glass fused together.

23 X Q. You knew perfectly well, did you not, before 1878 how to join two pieces of glass together by fusion so as to make a perfectly tight joint?

A. In the ordinary way of business, I did; we would often have parties coming in that would want pieces of glass joined together and found that they could not be fused or joined to any degree of satisfaction due to the glass parts not being of the proper composition of glass that would stand the heat of the flame, and upon being forced or ordered to go ahead independent of what would happen to the parts, the glass would fly to pieces.

24 X Q. Why could not the glass flange and the base plate shown in the drawing of the patent in suit be fused together?

A. I notice in the drawing that the glass disc is of such a thickness that in attempting to fuse or seal it to the brim or the flange of the globe which I see is quite heavy, that is, the flange of the globe, that the expansion of the glass by putting the flame to the disc and brim or flange of the tube would cause it to crack, I would consider it impracticable.

25 X Q. Would you have known that in 1878?

A. I would.

897 26 X Q. What changes would have to be made in the parts in order to make it feasible to seal them together?

A. That would be a matter of a series of experiments.

27 X Q. Wouldn't you have known in 1878 how to change the parts so that they could be successfully sealed together?

A. No doubt but what after a line of experiments had been conducted that some idea would suggest itself in reconstructing the apparatus.

28 X Q. Do you mean to say that anything further would be required than to make the glass thinner and to make both parts of the same kind of glass and to use such glass as you ordinarily use in constructing Geissler tubes?

A. As I said before, in conducting experiments in that direction there is no doubt that an idea may suggest itself in getting the instrument in proper shape.

29 X Q. What more would be required in order to make it feasible to seal the two parts together by fusion than is mentioned in my last question?

A. That I could not say. There is no doubt that the experiments prior to 1878 would have led me on to the proper course of constructing the instrument by the fusion of the different parts.

30 X Q. Don't you think it could readily have been done in the same way that you made Geissler tubes?

A. I do not.

31 X Q. When you commenced work for Mr. Edison in 1880 were lamps made in two pieces of glass?

Objected to as immaterial, incompetent and not proper cross-examination.

A. They were.

32 X Q. Were these two pieces united by fusion in substantially the same way in which you joined together the different parts of Geissler tubes and radiometers?

Same objection.

898 A. In the matter of Geissler tubes we have often made connections in the same way—we call it sealed—we fused them together in the same way.

33 X Q. Did you seal the platinum wires into the glass of the lamps you made for Mr. Edison when you first started there, by fusing the glass to the wires in substantially the same way as you had previously sealed platinum wires into Geissler tubes?

Same objection.

A. Practically the same.

34 X Q. Were the lamp globes provided with exhausting tubes sealed onto them in substantially the same way in which exhausting tubes were sealed onto the Geissler tubes and radiometers you had made before that time?

Same objections.

A. At that time we drew out the exhausting tube from the same piece of tubing out of which the tube was blown, but afterwards when we got globes blown from pot glass we sealed on separate tubes for exhausting.

35 X Q. Did you do any work for Mr. Edison before January, 1880?

A. I did not.

36 X Q. Why could not the tubular conductors shown in the drawing of the patent in suit be sealed into the glass base plate if they were made of platinum?

A. In the matter of sealing in the tubes, if they were made of platinum into the disc of glass as I see it here in this drawing, I would say that the difficulty in sealing them in would be in the cracking of the glass as soon as it would be subject to the heat of the flame; my experience has been this, that sealing in platinum wire or attempting to seal in platinum wire into a disc of glass, the result has always been that the glass would fly to pieces, due to the unequal expansion.

899 37 X Q. Couldn't it have been done by making the base piece of thin glass and bulb shaped or curved, as Geissler tubes were made?

A. Prior to 1878 that would have been a matter of a series of experiments to ascertain the proper method by which it could have been done.

38 X Q. You would have expected one of your skilled workmen to have done it, would you not, if you had merely directed him to do it without giving him any special directions as to how he was to do it?

A. I would have not.

39 X Q. You would have expected to accomplish it yourself if you had undertaken it, would you not?

A. That would have strictly depended upon the results of experiments that I would have conducted in that direction.

Redirect examination:

40 Re-D. Q. Referring to your answer to X Q. 29, what did you mean by the statement "that the experiments prior to 1878 would have led me to the proper course of constructing the instrument by the fusion of the different parts"?

A. I meant this—that if a party would call at my office or works and wanted an instrument made similar to the drawing of the patent I would have gone into a series of experiments to ascertain the best method in obtaining results, but I would not say that I would have been successful.

41 Re-D. Q. Would the drawing of the patent in suit have suggested to you as a practical glass-worker, that the glass parts were intended to be fused together or that the metal tubes were intended to be fused into the glass disc?

A. It would have not.

W. HOLZER.

Sworn to before me,
WILLIAM T. FARNHAM,
Notary Public and Special Examiner.

900 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
against
THE MCKEESPORT LIGHT COMPANY. } In Equity.

SIR: You will please take notice that the defendant in the above-entitled cause desires the evidence of the witnesses hereinafter named to be taken orally under the sixty-seventh rule of the Supreme Court as amended. And you will further take notice that on the 9th day of March, 1889, at the office of John H. Kitchen, Esq., No. 50 Pine street, New York city, a special examiner duly appointed in the above-entitled suit *to* take proves on behalf of the defendant therein, at 10 o'clock in the forenoon; said defendant will at such time and place proceed to take the testimony of Albon Man, Amos Broadnax, Jacob Hays, Hugh McCullough, Lawrence Myers, J. P. Kernochan, Mr. William Hockhausen and others, as witnesses in behalf of defendant. Such examination will proceed as directed by said examiner, and you are hereby invited to attend and cross-examine.

Dated March 8, 1889.

RICH'D N. DYER,
Of Counsel for Def't.

To Thos. B. Kerr, Esq., sol. for compl't.

901 United States Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
against
THE MCKEESPORT LIGHT COMPANY. } In Equity.

NEW YORK, *March 8th*, 1889.

Testimony taken on behalf of the defendant in the above-entitled cause before John H. Kitchen, examiner, under and in pursuance of the 67th rule of the Supreme Court of the United States, as amended.

Present: Mr. Thomas B. Kerr appears on behalf of the complainant; Mr. H. D. Donnelly appears on behalf of the defendants.

AMOS BROADNAX, a witness on behalf of the defendant, having been first duly sworn, says:

1 Q. What is your name, age, residence and occupation?

A. Amos Broadnax; age 62; residence 41 Jefferson avenue, Brooklyn, and I am a lawyer by profession.

2 Q. What are your relations at present to The Consolidated Electric Light Company, the complainant in this suit?

A. I am of counsel, but in this suit I am not managing counsel.

3 Q. Have you ever had any connection with a corporation known as the Electro-Dynamic Light Co.?

A. I have.

4 Q. What relation to such company have you had?

A. I was counsel for the company in all matters pertaining to its patents. My counselship did not extend beyond that.

902 5 Q. During what years were you counsel for the Electro-Dynamic Light Co.?

A. I was retained in the fall of 1878, and I have continued to be its counsel in such of its matters as relate to patents from that time to this—so far as I know.

6 Q. Do you know who the president and secretary of the Electro-Dynamic Light Company were in the years 1878 and 1879?

A. During a portion of that time—as I recollect it—Mr. Albon Man was president and he was succeeded by Thomas Wallace, of Ansonia, Conn., in the presidency; who was secretary during that time I really do not know; I have an impression that Wm. E. Sawyer was secretary during a part of that time, but who succeeded him I do not now know.

7 Q. Do you know at what time Albon Man and Mr. Wm. E. Sawyer ceased to be respectively president and secretary of the Electro-Dynamic Light Company?

A. I do not know the dates; if I undertake to state the time it would be mere guess; I think Mr. Man ceased to be president some time in 1879, and I think Mr. Sawyer ceased to be secretary in the same year, but what time I don't know, and I am not absolutely certain as to the year; it was certainly in 1879 or 1880.

8 Q. Do you know whether Wm. E. Sawyer is now living?

A. I did not see him die, nor did I see him after he was dead; I believe him to be dead.

9 Q. Do you know who are now respectively the president and secretary of the Electro-Dynamic Light Company?

A. Hugh R. Garden is president, and Mr. Stocker is secretary.

10 Q. If you know please state where they reside.

A. I don't know where Mr. Stocker resides; I have a card given to me by Mr. Garden about a year ago, from which it appears his residence is 61 West Fifty-second street; his place of business is 32 Nassau street, and with him is Mr. Stocker.

903 11 Q. Have you any knowledge or information as to where the books and papers relating to the business of the Electro-Dynamic Co. are or can be found?

A. I suppose that I have in my safe some of the papers relating to their patents, but what they are I could not tell. I think they are only papers that were used in the prosecution of their applications for patents. This is the only knowledge that I have about any of the company's papers. The books of the company I have no knowledge of whatever. The only one of its books I ever had was the minute book. That I had in my office for a few moments, perhaps an hour, some two or three months ago. It was sent to me by Mr. Garden, the president of the company, and to him it was returned. Since then I have not seen it, nor do I know anything about it.

12 Q. Did you examine the minute book of the Electro-Dynamic Light Co. so as to be able to say whether the book of minutes which

you had in your possession, as stated, contained a record of the proceedings of the board of trustees of said company, and if so, state what years it covered?

A. No, I never did. I have had the book in my hands a number of times for the purpose of fixing some dates about the license that was given by the company to Wallace & Sons, of Ansonia, Conn. I have never read the book one-third through, and I don't know what it contains. It is very likely that I have read some of the minutes of its proceedings, but certainly not within the last two or three years, and I have not the faintest idea of what I did read then. The book, when it was brought to my office some two or three months ago, was handed to Thomas B. Kerr; whether he read it or not I do not know, but I don't recollect whether I looked inside of it.

13 Q. Do you know whether the Electro-Dynamic Light Co. has ever had more than one minute book in which the proceedings of its board of trustees were contained or recorded?

A. I do not.

904 14 Q. Had you ever had this book in your possession prior to the time mentioned by you in your former answer?

A. I did.

5 Q. When?

A. When I took the testimony in the interference between Thomas A. Edison on the one side and Sawyer & Man on the other, and also when I took the testimony in the interference of Edward Weston on the one side and Sawyer & Man on the other.

That was four or five years ago. I think I returned it to Mr. Joseph Tate, who I believe, is now associated with John Hays & Co., No. 11 Nassau St., brokers. After that I was never able to find where the book was, and I did not ascertain where it was until about the time it was sent to my office by Mr. Garden, some two or three months ago. That is my best recollection of it now.

I asked Mr. Tate for it in the meantime, and he said he looked for it but could not find it. From whom Mr. Garden got it I do not know. I think Mr. Lawrence Meyers became secretary of the company either shortly before or shortly after I had it, and it is possible he may have had it. I don't recollect having asked him for it, though I may have done so.

16 Q. Can you now state whether the book of minutes of the Electro-Dynamic Light Co., which you have stated that you had in your possession, was the original book of minutes of said company, and whether it contained a record of meetings of said company during the years 1878 and 1879, or either of said years?

A. I do not know whether it was the original book of minutes or not, but I took it for granted that it was. Nor do I know whether the book contained a record of the proceedings of its board of directors. It was given to me as the minute book of the company, and it contained numerous entries of the proceedings of the board of directors of the Electro-Dynamic Light Co. as appears by the book itself, which I had in my possession, and I do not recollect of reading attentively the several entries of the book, and if I did I do not now recollect the contents of such entries.

905 17 Q. Were you and are you familiar with the handwriting of Wm. E. Sawyer?

A. I have seen Mr. Sawyer write and I have received letters from him and I think that I would know his handwriting.

18 Q. Do you now remember whether the minute book of the Electro-Dynamic Light Co. contained any entries in the handwriting of Wm. E. Sawyer, deceased?

A. I think it does. Making my statement on the handwriting itself which I have seen in the book.

19 Q. Please look at the paper-writing which I now show you and state if you know in whose handwriting the same is.

A. The paper you hand me is in my handwriting.

20 Q. Was said letter written at the time it bears date, to wit, on or about January 8th, 1880?

A. I take it for granted that it was, but I have no recollection about it. I had entirely forgotten that I had ever written such a letter.

21 Q. What was done with said letter after it was written by you. What did you do with it?

A. The letter is addressed to one Charles A. Cheever, Tribune building, and I presume I sent it to him.

22 Q. Do you know where you were when you wrote the letter?

A. The letter is written on a piece of paper captioned the "Tribune building," New York, January 8th, 1880. Whether I wrote the letter in the office of Mr. Cheever or my own office I do not recollect; I don't know at whose request I wrote it.

Defendant's counsel now offers in evidence said letter written by the witness to Charles A. Cheever, dated January 8th, 1880, and the same is filed in evidence and marked Defendant's Exhibit "Broadnax-Cheever" Letter.

23 Q. Do you know whether at the times Defendant's Exhibit
Broadnax-Cheever Letter was written the Charles A. Cheever
906 therein referred to was negotiating with the Electro-Dynamic
Light Co. for the purchase of the alleged invention upon
which the letters patent in suit are based?

A. I have been informed and believe that he was.

Cross-examination:

24 Q. Is it a fact that you were subpœnaed to appear here at 10 o'clock, and that at that hour you were to proceed with your cross-examination of Mr. Batchelor at the office of Dyer & Seely, No. 40 Wall street?

A. Yesterday afternoon down to about 4 or 4.30 o'clock I was engaged at the office of Dyer & Seely, No. 40 Wall street, in the cross-examination of Mr. Charles Batchelor in this suit. We adjourned at the time mentioned until this morning at 10 o'clock, at which time I was to proceed with the examination. At about 9 o'clock last evening the subpœna was served upon me to appear here this morning, and I do so appear in obedience to the subpœna.

Redirect:

25 Re-D. Q. Is it a fact that when you came here to be examined as a witness in this suit counsel for defendant offered to defer your examination until this afternoon or until Monday, if you so desired?

A. Yes, that is a fact, and it is also a fact that Mr. Dyer, the managing counsel of the defendant in this case, as I understand it, was present and requested me to remain and be examined, and in obedience to his request I did so.

AMOS BROADNAX.

Sworn to before me this 9th day of March, 1889.

JOHN H. KITCHEN, *Examiner.*

907 Jacob Hays, a witness on behalf of the defendant, being duly sworn, says:

1 Q. What is your name, age, residence and occupation?

A. Jacob Hays; I am 44 years of age; I am retired from business and now in the management of railroads and steamboats.

2 Q. Are you the Jacob Hays named in the certificate of incorporation of the Electro-Dynamic Light Co.?

A. I am.

3 Q. Were you a director of that company in 1878 and 1879?

A. I was.

4 Q. As such director did you attend any of the meetings of the board of trustees?

A. I did.

5 Q. Did you attend all the meetings that were held?

A. I could not say positively, but a majority of the meetings.

6 Q. Were you an officer of the company during the years 1878 and 1879, other than a director?

A. I was.

7 Q. What office did you hold in that company?

A. I was the treasurer.

8 Q. State, if you know, who the other members of the board of trustees were during the years 1878 and 1879?

A. As near as I can remember, Mr. Albon Man, Mr. William E. Sawyer, Hon. Hugh McColloch, Lawrence Meyers, William H. Hays, and I think James P. Kernochan, were members of the board of directors.

7 Q. Are any of the persons named by you in your last answer deceased?

A. William H. Hays, Wm. E. Sawyer, are deceased.

10 Q. Do you know where Mr. Lawrence Meyers resides or now is?

A. He resides in Plainfield, N. J.; now visiting Colorado.

908 11 Q. Do you know as to when Mr. Meyers is likely to return from Colorado?

A. I do not.

12 Q. Do you remember where the Hon. Hugh McColloch now resides?

A. Washington, D. C. A little out of Washington.

13 Q. Who was president of the board of trustees of the Electro-Dynamic Light Co., and who its secretary during the years 1878 and 1879?

A. Mr. Albon Man was the president and Mr. Wm. E. Sawyer was secretary. I cannot say positively that they remained in office throughout the year 1879.

14 Q. Can you say whether Mr. Wm. E. Sawyer was the secretary of the Electro-Dynamic Light Co. during the month of March, 1879?

A. My impression is that he was.

15 Q. Do you remember whether Mr. Wm. E. Sawyer was present and kept a record of the proceedings of the meetings as secretary on the occasions when you attended them?

A. Mr. Sawyer was the secretary at all the meetings and took down the minutes in short-hand. He was a stenographer.

16 Q. Do you know whether he transcribed his minutes after they were so taken into any minute book or record book of the company?

A. He did.

17 Q. Do you now remember of having seen or examined in 1878 or 1879, the minute book of the Electro-Dynamic Light Company in which Mr. Wm. E. Sawyer recorded the proceedings of the board of trustees of said company?

A. I have seen it, but do not remember whether I ever examined it.

18 Q. When and where did you see said book of minutes, while Mr. Sawyer was secretary of the Electro-Dynamic Light Co.?

A. At the office of Classon & Hays, No. 3 Nassau street, where the meetings of the company were held.

19 Q. When last did you see said book of minutes and in whose possession was it?

909 A. Yesterday. Two or three days ago. Mr. Donnelly and a gentleman with him called at my office, No. 11 Pine street, and asked me the question as to where the minute book of the Electro-Dynamic Light Company was; I told him I did not know; his manner excited my curiosity, knowing he was a lawyer; I immediately called upon Mr. Hugh R. Garden, knowing he was the president of the Electro-Dynamic Light Co. I informed him of the conversation which took place between Mr. Donnelly and myself. I asked Mr. Garden if he knew where the minute book was. He told me he did, and that it was in his possession.

20 Q. Where was the business of the Electro-Dynamic Light Co. carried on in March, 1879?

A. 94 Walker street.

21 Q. Do you now remember the names of the persons then in its employ, other than its officers or directors?

A. Mr. Sawyer's father, and a Mr. Myers, whose first name I do not know. A young man now dead, as I am informed. There were other persons employed, but I do not remember their names.

22 Q. Do you remember whether or not the Electro-Dynamic Light Co. suspended, or partially suspended, its business operations in or about the month of March, 1879?

A. They partially did suspend.

Cross-examination:

23 X Q. What was the reason of that suspension?

A. On account of Mr. Wm. E. Sawyer's bad habits.

24 X Q. In what respect?

A. He was a drunkard, and kept company with bad characters.

25 — Q. What effect had that upon his work?

A. It kept him from the attention he should have given to his business.

26 X Q. What was the feeling of the board as to the matter of continuing operations under Sawyer's management?

910 A. They were disgusted with him on account of his habits and inattention to business, and placed in charge Mr. Lawrence Meyers the management, and also for the purpose of trying to keep Mr. Sawyer straight.

27 X Q. Was Mr. Lawrence Meyers an electrician or mechanic?

A. He was not.

28 X Q. What was the character of Mr. Sawyer's workmanship during this period—was it good or bad?

Objected to by defendant's counsel as incompetent and improper, because the question calls for evidence not responsive to the examination in-chief.

A. It was good.

29 X Q. What railroad and steamboats have you management of, and in what capacity?

A. I am the vice-president of the Eighth and Ninth Avenue Street R. R. of this city and treasurer of the People's Line of steamers, known as the N. J. Steamboat Company, running from N. Y. to Albany and return. I am also a director and member of the executive committee of the Brooklyn and New York Ferry Company. I am a member of the N. Y. stock exchange.

30 X Q. Who was Wm. H. Hays?

A. He was my father.

31 X Q. What was his business and his position generally in New York?

A. He was president of the Bank of the State of New York. President of the Eighth and Ninth avenues surface roads of this city, and interested in other institution- and corporations.

32 X Q. Who is Mr. Lawrence Meyers, and what is his standing and position in N. Y.?

A. Mr. Lawrence Meyers is a gentleman of wealth and retired from business, and is at this time the receiver of the Richmond and Allegany R. R.

33 X Q. Who is the Hon. Hugh McColloch?

A. A gentleman of national reputation. Having been
911 twice Secretary of the United States Treasury, and a man of
wealth.

34 X Q. Who is Mr. James P. Kernochan?

A. Mr. Kernochan is a gentleman of wealth. Stands very high, and retired from business, and is connected with the well-known Lorrillard family of this city.

35 X Q. Who is Mr. Albon Man and what has been his standing and connection in this community during your acquaintance with him?

Question objected to by defendant's counsel as immaterial and irrelevant, and as improper because it is not responsive to the examination-in-chief; also because the character of Mr. Man is not a subject of controversy in this suit.

A. Mr. Man is a gentleman and a lawyer by profession, and was for a number of years manager and agent of the Lorillard estate.

Defendant's counsel objects to the answer upon the same grounds as stated in his objection to the last question, and moves to strike the same from the record.

36 X Q. How do you know that the business of the Electro-Dynamic Light Co. was carried on at 94 Walker St.?

A. Because I spent considerable time at the office; on an average four times a week.

37 X Q. What did that business consist of?

A. Experimenting on electric lights and making them.

38 X Q. Did you ever see any of these lights there?

Objected to as incompetent and improper because the evidence called for by the question does not grow out of or relate to the examination-in-chief, and defendant's counsel gives notice that the complainant's counsel makes the witness his own by pursuing this line of inquiry, and he further gives notice that
912 on or before the final hearing of this cause defendants will
move to strike this evidence from the record in this suit.

A. I did.

39 X Q. In process of manufacture?

Same objection. Same notice as to the last question.

A. Yes.

40 X Q. Any of them in use there?

Same objection. Same notice.

A. Yes.

41 X Q. How did they work?

Same objection and notice; also as incompetent and improper because the question calls for the opinion of the witness, and the witness has not been shown qualified to give an opinion upon the subject inquired about.

A. They worked well.

42 X Q. Then it was not on account of the character and operation of the lamps that the company suspended operations, was it?

Same objection and notice as to the last question and answer; also as leading and suggestive.

A. It was not.

Redirect:

43 Re-D. Q. Are you now a director and stockholder of The Consolidated Electric Light Company, the complainant in this suit?

A. I am.

913 44 Re-D. Q. You were not a practical electrician or an electrical engineer in 1879, were you?

A. I was not.

Recross:

45 Re-X Q. What leads you to say, then, that the lamps worked well?

Same objection and same notice as to X Q. 41.

A. Because I was constantly at the office, 94 Walker street, and saw them in use and giving such beautiful light.

Same objection as to the last question and answer. Defendant's counsel gives notice that before or at final hearing he will move to strike the same from the record, for the reasons stated in objection to the answer to X Q. 41.

JACOB HAYS.

Sworn to before me this 8th day of March, 1888.

JOHN H. KITCHEN.

William Hochhausen, being duly sworn, says:

I am 48 years of age and reside in Brooklyn, N. Y. I am an electrician, employed at present by Excelsior Electric Company as electrician and superintendent.

1 Q. What was your business in January, 1880?

A. I was manufacturing dynamo-electric machines.

2 Q. Alone or in company with some other person?

A. In 1880 in company with Mr. Anthony Arnoux.

3 Q. What was the name of the firm at that time?

A. Arnoux & Hochhausen.

4 Q. Where was the firm's business carried on in January, 1880?

A. We were still at the building corner Howard and Centre streets.

914 5 Q. Is Mr. Arnoux living or dead?

A. Mr. Arnoux is dead.

6 Q. When did he die?

A. In the summer of 1884.

7 Q. Please look at the paper-writing I show you and state whether you know in whose handwriting it is, and if so, please give the person's name who wrote it. (Paper shown witness.)

A. This letter was written by Mr. Arnoux.

8 Q. Are the body of the letter and the signature thereto in the handwriting of Mr. Arnoux?

A. Yes, sir; they are both in his handwriting.

9 Q. Had you ever seen this letter prior to your examination to-day?

A. I have not.

10 Q. Do you know at whose request the letter I have shown you was written?

A. I have no knowledge about that.

11 Q. Were you personally acquainted with Mr. Charles A. Cheever at the time this letter was written in January, 1880?

A. I had seen Mr. Chas. A. Cheever previous to that time at our own place of business.

12 Q. Do you know whether this letter was written at the request of Mr. Cheever?

A. I do not.

Letter shown witness is offered in evidence by the defendant and the same is filed in evidence and marked Defendant's Exhibit "Arnoux-Hochhausen" Letter.

The letter is so marked.

J. H. K., *Examiner*.

WM. HOCHHAUSEN.

Sworn to before me this 8th day of March, 1889.

JOHN H. KITCHEN, *Examiner*.

915 ALBON MAN, being duly sworn, says:

1 Q. What is your name, age, residence and occupation?

A. Albon Man; 62 years old; 118 Putnam avenue, Brooklyn. I am a lawyer by profession, and take some interest in electrical matters.

2 Q. Were you the president of the Electro-Dynamic Light Co. in the years 1878 and 1879?

A. I was the president in 1878 from the time of the organization of the company, and in 1879 up to some time in the spring of that year, or early summer, I should think, May or June, when Thomas Wallace, of Ansonia, Conn., was elected president.

3 Q. During the time you were president, in 1878 and 1879, of said company, who was its secretary?

A. William E. Sawyer was secretary from the organization of the company up to some time, according to my recollection, in March, 1879, or a little later, when he resigned. If my recollection serves me, another person was elected then in Mr. Saw-er's place.

4 Q. During the time that Mr. Sawyer was secretary in 1878 and 1879, do you know whether he kept a minute book or record of the

proceedings and acts of the board of trustees of the Electro-Dynamic Light Co.?

A. He did in the minute book of the company of such formal proceedings of the board as are recorded in those minutes.

5 Q. Do you know where that minute book is?

A. I have recently heard that it is in the possession of Mr. Hugh R. Garden; I saw such a book in his hands, I think it was yesterday, at No. 32 Nassau street, in his office, which he told me was the minute book of the Electro-Dynamic Light Co., and I recognized it from its appearance as such. I was well acquainted with the book and have no doubt that it was or is the minute book of that company.

6 Q. State, if you know, what Mr. Hugh R. Garden's relations are to the Electro-Dynamic Light Co.?

A. I only know that he told me that he was its president.

916 7 Q. Do you know who the secretary of said company is at present?

A. I do not.

ALBON MAN.

Sworn to before me this 8th day of March, 1889.

JOHN H. KITCHEN, *Examiner.*

Adjourned to Monday, the 11th of March, 1889, at 11 a. m.

JOHN H. KITCHEN, *Examiner.*

MONDAY, *March 11th*, 1889—11 a. m.

Adjourned to Tuesday, March 12th, 1889, at 11 a. m.

NEW YORK, *March 12th*, 1889—11 a. m.

Met pursuant to adjournment.

WM. HOCHHAUSEN, recalled, says:

Q. Referring to Defendant's Exhibit Arnoux-Hochhausen Letter, January 9th, 1880, please state whether you have read the same and know the contents thereof?

A. I have read the same just now, and know the contents thereof.

Q. Please state whether the statements therein contained are true to your knowledge?

A. They may be true, although the date mentioned in the letter does not agree with my recollection about the time the lamp was placed in Mr. Arnoux's hand, but it is very likely that the lamp referred to in the letter was shown to Mr. Arnoux on the date he mentioned, with a view of having it left in his keeping, and that he neglected to take it up to our office at that time, and that 917 on the appearance of the article in the "Herald" about Edison's incandescent electric light invention, Mr. Sawyer recollected that the lamp was still in his place and he took it up next Monday forenoon to Mr. Arnoux's office. In other respects the letter seems to be correct in accordance with my recollection and knowledge.

Cross-examination:

Q. The article announcing Mr. Edison's invention was published in the "New York Herald" on December 21st, 1879. I understood from your former testimony in this case that Sawyer brought the lamp around the next day; are you not mistaken in your last answer, as to the time when the lamp was placed in Mr. Arnoux's hand?

A. As I have just been informed that the article was published on the 21st of December, 1879, I was at fault in my answer; the date given in the letter must be the true one; and with that understanding I correct my last answer and say that the contents of the letter are true.

WILLIAM HOCHHAUSEN.

Sworn to before me this 12th day of March, 1889.

JOHN H. KITCHEN, *Examiner.*

HUGH R. GARDEN, being duly sworn, says:

1 Q. What is your name, age, residence and occupation?

A. Hugh R. Garden; age 48; occupation lawyer; residence New York city.

2 Q. Do you know of a corporation known as the Electro-Dynamic Light Co., and if so how, if at all, are you connected with it?

A. I know the corporation styled the Electro-Dynamic Light Co., and am the president of it.

918 3 Q. How long have you been president of said corporation?

A. I was elected the president of said corporation during January, 1889, I think.

4 Q. Has the Electro-Dynamic Light Co. a secretary, and if so, please give his name and residence?

A. It has a secretary; his name is C. W. Stocker; his office address is room 607–608, at No. 32 Nassau street, N. Y.

5 Q. Have you now in your possession the book of minutes containing the record of the proceedings of the board of trustees of the Electro-Dynamic Light Co.?

A. I have in my possession a book purporting to contain such record.

6 Q. During what years does said minute book contain a record of the proceedings of the board of trustees of the Electro-Dynamic Light Co.?

Counsel for the complainant stated of record that in accordance with the request of Mr. Lowrey, of counsel for defendant, he has requested the witness to produce the said minute book of the Electro-Dynamic Light Company, before the examiner this morning, and that the witness has done so in accordance with said request, and the book is now produced for use of the defendant's counsel, and the question is objected to for the reason that the book itself is the best evidence and of the periods covered by said book.

A. I am not familiar with the dates or the contents of the minute book, having had no connection officially with the Electro-Dynamic Light Co. prior to the winter of 1888–1889, but at the request of counsel I have brought the minute book, and I offer the same in evidence.

Defendant's counsel objects to that part of the answer of the witness wherein he states that he offers the minute book in evi-
919 dence as not responsive to the question, and he does not consent that the same be offered in evidence at this stage of the examination of the witness.

Counsel for complainants requests that the fact be stated that the witness has shown the book to counsel. (A book is handed to defendant's counsel by the witness.—J. H. K., Ex.)

7 Q. Will you now produce the minute book of the board of trustees of the Electro-Dynamic Light Co., and allow the defendant's counsel to inspect the same?

A. Defendant's counsel has now the minute book in his possession, and the witness will be pleased to have him examine it thoroughly.

It is conceded by complainant's counsel that the book produced is the minute book of the Electro-Dynamic Light Co. and the only one they ever had. As to the period covered, counsel states that the book itself is the best evidence of that. As to the record of proceedings, counsel also concedes that it contains a correct statement of the proceedings of the Electro-Dynamic Light Co. during the period embraced in the book.

8 Q. Please examine said minute book at pages 46 to 53 inclusive, and state whether you find therein a record of the proceedings of a meeting of the board of trustees of the Electro-Dynamic Light Company purporting to have been held on the 20th day of March, 1879?

Objected to as the witness has no personal knowledge of said meeting, and the book itself is the best evidence of the fact inquired for by the counsel, and of its own contents.

A. I can only answer the question by reading what appears on the pages 46–53 inclusive in the book referred to. After
920 reading from the minute book, I now state that within the pages referred to there is what purports to be a record of the proceedings of board of trustees of the Electro-Dynamic Light Company held on the 20th day of March, 1879.

Defendant's counsel offers in evidence from the book of minutes of the Electro-Dynamic Light Company a record of the proceedings of the board of trustees of said company purporting to have been held on the 20th day of March, 1879, at 3.30 p. m., No. 3 Nassau street, N. Y. city, said record being on pages 46, 47, 48, 49, 50, 51, 52 and 53, inclusive, of said minute book, and purporting to have been signed by W. E. Sawyer, sec'y. Said record of March 20th, 1879, is filed in evidence and marked Defendant's Exhibit "Electro-dynamic Light Record, March 20th, 1879."

The offer is objected to as incompetent unless the whole book is offered in evidence; that being a part of their record and as showing only a portion of the proceedings of the said company appertaining to the subject included in the offer, and as an attempt on the part of the defendant to cut off the complainant from proper cross-examination, and also to conceal from the court matter material to the controversy. Notice is hereby given that a motion will be made at or before the hearing of this cause upon proper notice as to time and place to strike out the mutilated record thus attempted to be offered by the defendant.

9 Q. Please examine said record, Defendant's Exhibit "Electro-dynamic Light, March 20th, 1879," and state if you know in whose handwriting it is?

A. I have examined the record referred to and I do not know in whose handwriting it is.

10 Q. Please state from whom you received said book of minutes and how long it has been in your possession?

921 A. The minute book was brought to my office at the time that I was elected president of the company. But who brought it there I do not know. I think this was in January, 1889. I see by reference to the minute book itself that I was elected president on the 19th of December, 1888, to fill the unexpired term of Mr. Thomas Wallace, the former president, and that at the annual election which took place in January, 1889, I was re-elected president, and the book was probably brought to my office at the time I was elected in December, 1888, and has since been in my custody.

11 Q. At the time said minute book was delivered to you, was it put into your custody as the minute book of the Electro-Dynamic Light Company in which the proceedings of its board of trustees were recorded?

A. I so understood it.

Adjourned to 2 p. m.

MARCH 12, 1889.

Met pursuant to adjournment.
Counsel present as before.

It is hereby stipulated that a copy of the minutes of the board of trustees of the Electro-Dynamic Light Company of the meeting held March 20th, 1879, offered in evidence by the counsel for the defendant, may be copied in the record by the examiner and have the same force and effect as the original in the minute book of the said company, subject, however, to the objection made by counsel for the complainant.

It is also agreed that the complainant will produce the said minute book at the hearing of this cause, or at any time during the taking of the defendant's evidence on proper notice from the defendant.

The examiner here copies the said minute-.

922 At an adjourned meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 3 Nassau street, on Thursday, March 20th, 1879, at 3.30 p. m. Present—Messrs. Albon Man, Hugh McCulloch, Wm. H. Hays, Jacob Hays, Lawrence Myers, Jas. P. Kernochan and W. E. Sawyer; the president in the chair.

The minutes of the previous meeting and of the two adjournments which followed were read and approved.

The treasurer's report to date was presented and read, showing a balance of cash in bank of $2.61. Total liabilities, $3,536.72; of which amount there is due to—

Albon Man	$1,850	
Jacob Hays	750	
Hugh McCullough	150	
Lawrence Myers	150	
Wm. H. Hays	150	
J. P. Kernochan	150	
Man & Parsons, lawyers	310	50

From which the president promised to secure a reduction.

On motion the report of the treasurer was referred to the auditing committee, consisting of the president, vice-president and secretary, for examination and approval.

The president then made the following report which the secretary took down verbatim:

"The president reports that on Tuesday last he discharged the workmen employed by the company at No. 94 Walker street, and gave them notice that nothing further would be required of them by the company; that he consented to Mr. W. E. Sawyer doing any work he desired to do there; and that since that time Mr. Sawyer has been at work there. There is nobody left in the employ of the company except Mr. Edwin L. Myers. The men are paid up to the expiration of the time when they were discharged. Edwin L. Meyers was put in charge of the shop by the president to look after the property of the company, and remains in that capacity
there, receiving a salary of $12 per week. Mr. Sawyer has
923 expressed to the president of the company the greatest
possible confidence that the princip*al* upon which he had been at work to build lamps was correct, and that those lamps that had been put up, except for some unknown reason (probably something about the filling), would be permanent and last forever. Some half a dozen or more lamps that are there are perfect and he (Sawyer) believed would never burn out, but remain as they are, but, in his (Sawyer's) judgment, a manufacture of lamps of that character was so uncertain that he declined to put them on exhibition anywhere. Since the last meeting of the company Mr. Sawyer has been at work principally upon a feeder lamp. On Tuesday evening of this week the feeder lamp was completed and was filled with illuminating gas and lighted up; fed up from the outside without any connection with the air at all, but fed up from the outside. The lamp was filled with illuminating gas because the conveniences of obtaining nitrogen were not at hand, and then

a vacuum made in the lamp, taking out most of the gas and leaving only a very small portion in. The lamp burned well for about half an hour in illuminating gas and was then shut off. Mr. Sawyer had it taken down on the next day, which was Wednesday, and filled by Mr. Stillman, and this morning Mr. Edwin L. Myers run it and fed up the carbon pencil twenty-one times, and his report is that there was no consumption of it, and that the lamp seemed to be a good and perfect lamp; that the carbon was entirely defective and good for nothing, because it had not been treated. It should have been treated before it was put in the lamp. Mr. Sawyer expresses confidence that lamps put up with a feeder of that kind will last forever, and he will be ready to put it on exhibition, but the president himself expresses his own views in regard to it that, while Sawyer's views are probably correct, personally, for other reasons, he is unwilling to go on expending money of himself and others in building lamps."

On motion, it was ordered that the report of the president be entered on the minutes and his action approved.

924 The secretary, Mr. Sawyer, then proposed that the gentlemen present, being unwilling to go on with the business of the company, that he should be allowed the free use of the shop and tools of the company until the 20th of April, in and with which to conduct his own experiments at his own expense; that he should be allowed three months' time in which to pay the debts of the company, and that upon his paying the debts of the company, not to exceed four thousand dollars in amount, all of the members of the board now present, excepting himself, shall turn into the treasury of the company two-thirds of the stock and scrip originally held by them, which shall be used as a working capital to secure funds for carrying on the business of the company, the same to be sold at no less than 50 cents on the dollar of par value. The proposition of the secretary was considered and accepted by unanimous informal agreement, with the understanding that the remaining one-third of stock and scrip retained by the present members of the board, excepting himself, shall be protected from assessment or debt either by two of the present board members, excepting the secretary, retaining their board membership in any new organizations to be effected, or by some other means to be devised hereafter.

On motion of Mr. McCulloch, it was

Resolved, That all authority heretofore given expressly or by implication to any officer of this corporation to contract debts for the company be and hereby is rescinded.

Resolved, That all expenses of the company, excepting the salary of Mr. Edwin L. Myers, be revoked, and that he shall be continued in charge of the property of the company at No. 94 Walker St. until otherwise ordered.

Resolved, That W. E. Sawyer be authorized to use for experimental purposes at his own expense the office and premises, machinery and tools of the company at No. 94 Walker St. free of rent until the 20th of April next.

925 The secretary was requested to state in the minutes that the feeder-lamp invention made by him at the expense of the company is the property of the company for the United States, to which he hereby agrees and assents and will make all necessary assignments, provided the company procures the patent upon it within a reasonable time.

Adjourned.

W. E. SAWYER, *Sec'y.*

Cross-examination:

122 Q. Please examine the minute book and state whether there are any minutes of any other meeting of the trustees of the Electro-Dynamic Light Company signed "W. E. Sawyer, sec'y," and in the same handwriting as the minute of March 20th, 1879, and if so, please give the dates of said meetings?

Defendant's counsel objects to the question *and* as incompetent, on the ground that the question calls for evidence not responsive to the examination-in-chief, and because it calls for the opinion of the witness as to the handwriting of W. E. Sawyer, and the witness is not shown to be competent to express an opinion upon the subject inquired about or to make a comparison as to the similarity or dissimilarity of the handwriting of the person who recorded the proceedings in said book of minutes.

A. Beginning at page 1 of said book, I find what purports to be a meeting of the trustees of the Electro-Dynamic Company, held at No. 3 Nassau street on the 15th day of July, 1878, the said record ending on the 15th page of said book. The record of the proceedings, or alleged proceedings, is in the same handwriting as that of the proceedings of March 20th, 1879, and it closes on page 926 15 with the words "W. E. Sawyer, secretary." The same remarks apply to a record of a meeting purporting to have been held September 10th, 1878, at the same place, beginning on page 16 and ending on page 18. The same remarks apply to a meeting of the board of trustees purporting to have been held October 8th, 1878, beginning on page 19 and ending on page 20, except that the word "secretary" is not written out in full, but is written "sec'y."

The same remarks as the last apply to a meeting of said board purporting to have been held October 15th, 1878, beginning and ending on page 21.

The same remarks apply to a record of what purports to be a meeting of said board held October 31st, 1878, beginning on page 22 and ending on page 26.

The same remarks apply to a record of what purports to be a meeting of said board held on the 12th of November, 1878, beginning at page 27 and ending at page 36.

The same remarks apply to a record of what purports to be a meeting of said board on December 12, 1878, beginning on page 37 and ending on page 40.

The same remarks apply to what purports to be a record of a meeting of said board January 14, 1879, beginning and ending on page 41.

The same remarks apply to a record of what purports to be a meeting of said board February 18, 1879, beginning and ending on page 42.

The same remarks apply to what purports to be a meeting of said board held February 25, 1879, beginning on page 43 and ending on page 45.

On page 45 there is also a record of what purports to be a meeting held March 11, 1879, which is not in the same handwriting, except that the signature "W. E. Sawyer, sec'y," is in the same handwriting as that referred to in the question asked.

There is also on page 45 a record of what purports to be a meeting held March 18th, 1879, which is altogether including the signature, in the handwriting referred to in the question.

927 The same remarks apply to what purports to be a record of a meeting of said board held April 8th, 1879, beginning on page 54 and ending on page 55.

The same remarks apply to what purports to be a meeting of said board held April 19th, 1879, beginning and ending on page 56.

The same remarks apply to what purports to be a meeting of said board held April 26th, 1879, beginning on page 57 and ending on page 64.

The same remarks apply to what purports to be a record of the proceedings of said board held May 13, 1879, beginning at page 65 and ending at page 66.

The same remarks apply to what purports to be a record of a meeting of said board held May 14, 1889, beginning and ending on page 67.

The same remarks apply to a record of what purports to be a meeting of said board held May 20th, 1879, beginning on page 68 and ending on page 76.

The same remarks apply to a record of what purports to be a meeting of said board held June 10th, 1879, beginning on page 77 and ending near the top of page 78.

I find nothing more in said book in the handwriting referred to.

Same objection to answer as to the question.

13 Q. State whether the minutes you have referred to of meetings beginning on July 15th, 1878, and ending on June 10th, 1879, constitute, together with the minutes of March 20th, 1879, all the minutes contained in said minute book between those dates.

Same objection as to last question; also as immaterial and irrelevant, and as improper and incompetent, because the minute book is the best evidence of what it contains.

A. They constitute all of the minutes recorded in said book between the dates mentioned.

928 14 Q. Please read to the examiner the minutes of each meeting you have referred to in your 12th answer, so that he may take them down in the record?

Defendant's counsel objects to the question and to the evidence called for thereby upon the ground that the same is immaterial and irrelevant and the question calls for new matter not relating to or growing out of the examination-in-chief, and because the original record itself, if competent at all, is the only competent evidence of the facts therein recited, and defendant's counsel further objects and protests that it is not competent or proper for the complainants to burden the record of the defendant with new and irrelevant matter or to take the defendant's time, which is limited, in spreading their own evidence upon defendant's record, thereby consuming defendant's time and greatly adding to the expense of this litigation.

The defendant's counsel also objects that no proper or sufficient foundation has been laid by the complainant's counsel for the introduction of the minutes of said alleged meetings in evidence.

The defendant gives notice that if the complainant's counsel pursues the line of examination indicated in the question, he will make said witness his own and will be bound by the evidence called out, and he further gives notice that he will move the court before final hearing or at final hearing to strike said incompetent, immaterial and irrelevant matter from defendant's record.

Counsel for complainant states that he has no desire to take defendant's time; that he has proposed to defendant's counsel to permit the examiner's clerk, who is taking this testimony, to copy the minutes called for in the question on the record and to permit the witness to compare the said copy after it is made. That during said time, the examination of other witnesses 929 can proceed, attendance of counsel being unnecessary here, but defendant's counsel has seen fit to refuse. Complainant's counsel offers to have copies of the said minutes made and put in subject to the objection of defendant's counsel already taken, just as complainant's counsel has stipulated in a copy of the one minute defendant's counsel has offered. Complainant's counsel states that so far from delaying defendants he has provided counsel to attend two other examinations now going on in defendant's behalf in different places, and that his course in this matter has been rendered necessary by the unfair and improper course of the defendant in attempting to put in part of the minutes in the hand of William E. Sawyer, without putting the whole of them in.

A. (Witness reads:)

At a meeting of the trustees of the Electro-Dynamic Light Co. held at No. 3 Nassau St., in the city of New York, on the 15th day of July, 1878.

Present—Messrs. Hugh McCulloch, Wm. H. Hays, Albon Man, Jacob Hays, Lawrence Myers and W. E. Sawyer; Mr. Jas. P. Kernochan being represented by Mr. Albon Man—trustees.

On motion Mr. Hugh McCulloch was appointed chairman, and W. E. Sawyer, secretary *pro tem.*

The counsel of the company reported that the certificate of incorporation had been filed in the office of the secretary of state and in the office of the clerk of New York county, on the 11th day of July, 1878; and presented a certified copy of the certificate as filed.

On motion of Mr. Albon Man it was resolved to ballot for officers.

The balloting resulted in the unanimous election of the following officers:

President, Wm. H. Hays.
Vice-president, Albon Man.
Secretary, W. E. Sawyer.
Treasurer, Jacob Hays.

930 The vice-president-elect took the chair and on motion it was

Resolved, That the patents and patent rights and agreements belonging to William E. Sawyer and Albon Man, relating to the subject of electric lighting and the production and distribution of electric currents be purchased by the company and that the president and secretary be and hereby are directed to issue to the said Sawyer and Man the whole capital stock of the company and two hundred and ninety thousand dollars in scrip certificates of the company, payable out of profits, in the form now presented to the company and exhibited here on the minutes; the price at which said patents and patent rights and agreements are purchased being $300,000.

Following is a list of the patents, viz:

"Electric lamps," No. 205,144.
"Electric lighting system," No. 205,303.
"Regulators for electric lights," No. 205,305.

And two-fifths of the following patents, viz:

"Electric engineering and lighting apparatus and system," No. 194,111.
"Electric engineering and lighting system," No. 196,834.
"Electric lighting apparatus," No. 194,503.
"Electric candles," No. 194,500.

The agreements between W. E. Sawyer and Albon Man bear date as follows:

February 15th, 1878.
March 19th, 1878.
March 25th, 1878, and
May 11th, 1878.

On motion the secretary read the following by-laws, which were adopted, viz:

931 BY-LAWS OF THE ELECTRO-DYNAMIC LIGHT COMPANY.

I.—*Board of Trustees.*

The stock, property and concerns of the company shall be managed, except as hereinafter provided, by a board of seven trustees, who shall be stockholders, and shall hold their offices until others are elected in their stead, and who shall have power to fill vacancies in their body, but only by the concurring vote of a majority of the trustees then existing.

II.—*Officers.*

The regular officers of the company shall be a president and vice-president, treasurer and secretary.

III.—*Annual Election.*

The annual election of trustees shall be held on the second Tuesday of January in each year, at the office of the company in the city of New York, at such hour as the board shall direct—or, if no other hour be designated, then at 3 o'clock p. m. At the same time and place three inspectors shall be chosen to hold the next annual election. Such election shall be by ballot; each share of stock entitling the holder to one vote.

IV.—*Election of Officers.*

The president, vice-president, treasurer and secretary shall be elected annually within forty days after the election of the board of trustees, and they shall hold their offices until their successors are chosen, save in cases of removal by the board or other disqualification.

Vacancies in office may be filled at any meeting of the board.

932 Such elections shall be by ballot; and a majority of the whole board for the time being shall be necessary to a choice.

V.—*Meetings of the Board.*

The stated meetings of the board of trustees shall be held on the second Tuesday of each month, at the office of the company in the city of New York, at such hour as the board shall direct; or, if no other hour be designated, then, at 3 o'clock p. m.

A majority of the whole number of trustees for the time being shall constitute a quorum for the transaction of business at any meeting, whether stated or special.

The president, vice-president or any two trustees may direct the call of a special meeting of the board at discretion.

Any meeting may adjourn from time to time to a day and hour then specified.

VI.—*Call of Special Meetings.*

Special meetings may be called by the president, vice-president or any two trustees, notice to attend which shall be given to all by mail or otherwise.

VII.—*Order of Business.*

The order of business at meetings of the board of trustees (unless dispensed with at any meeting by unanimous vote) shall be:

1. Calling the roll.
2. Reading the minutes of the preceding meeting or meetings.
3. Reading the minutes and reports, consecutively, of the execu-

tive committee, president, treasurer, standing committees and special committees.

4. Miscellaneous business.

All questions shall be decided by the vote of a majority of the trustees present at any meeting, except as herein otherwise
933 provided, and the yeas and nays shall be recorded on the demand of any member.

VIII.—*Executive Committee.*

There shall be an executive committee to consist of three trustees. It shall be chosen, and vacancies therein filled, by the board of trustees. The committee may fix the time for its stated meetings, and may be called together also for special business by any member thereof.

All ordinary executive powers, not specially delegated to the offices of the company, or to other committees, shall be exercised by the executive committee—subject, however, to such regulations or directions as the board of trustees may adopt.

The executive committee shall have power, subject to such regulations as the board of trustees may adopt, to suspend any superintendent, clerk or agent of the company from duty or employment. It shall also exercise a general supervision over the pecuniary affairs of the company, and advise with the officers in respect to any measure of finance, and examine as often as they may think proper, or as the board may direct, all accounts and vouchers of the treasurer and other officers or agents, and report thereon.

IX.—*Subordinate Officers.*

The board of trustees may appoint such superintendents and other subordinate officers, clerks or agents as the business of the company may require, and may fix their salaries or other compensation.

X.—*Duties of President.*

The president shall preside at the meetings of the board and discharge all duties usually pertaining to the office.

934 In case of his absence or disability, his duties shall be performed by the vice-president; and if both be absent or unable to attend to such duties, then a president, *pro tem.*, to be named *viva voce* or otherwise by the board.

XI.—*Duties of Treasurer.*

It shall be the duty of the treasurer to receive and safely keep all moneys belonging to the company, which shall from time to time be deposited in bank to the credit of the company by its corporate name. He shall keep correct books of account, which shall be the property of the company; and shall preserve correct vouchers for all disbursements, except petty cash; and shall exhibit the financial condition of the company by report at the annual meeting, and also, whenever required, to the board of trustees or executive committee. He shall be custodian of the corporate seal.

XII.—*Duties of Secretary.*

It shall be the duty of the secretary to attend the meetings of the board and keep correct and full minutes of the proceedings; to keep the records, correspondence, and papers of the company; to give notice of all special meeting- of the company and of the board of trustees, and also (when requested) of the meetings of committees; to furnish to each committee or its chairman a copy of every resolution appointing such committee, or relating to the committee or its business; to conduct the general correspondence of the company; and to discharge all other duties usually devolved upon a secretary.

XIII.—*Transfers of Stock.*

The secretary shall keep a suitable (or scrip)* book in which all transfers of the stock shall be made.

935 No transfer of stock or scrip shall be made until the previous certificate (if any) given for the same stock or scrip shall have been surrendered and canceled.

No transfer shall entitle the holder to a dividend, or to vote upon stock or scrip, unless regularly entered upon the transfer book.

The transfer book shall be closed for ten days prior to the annual election, and for ten days prior to the payment of any dividend.

On the day of the annual election, the secretary shall furnish for use of the inspectors an alphabetical list of all the stock and scrip holders at the time of closing the books preparatory thereto, with the number of shares held by each.

XIV.—*Stock Certificates.*

All certificates of stock and scrip shall be signed by the president and countersigned by the secretary, and the corporate seal affixed, and unless so authenticated, they shall not be valid.

XV.—*Safeguard Against Personal Liability.*

For the protection of the stock and scrip holders and officers of the company against personal liability, and to preserve the credit of the company, it is expressly provided that no work shall be ordered or authorized, or liability of any kind incurred by or on behalf of the company unless ample means shall at the time be in the treasury and immediately available to meet such liability. It shall be the duty of the executive committee to see that this by-law is strictly complied with, and they shall have full power to prevent any violation of it by officers or agents of the company.

---

* Interlineation in book.

XVI.—*Special Meetings of Stock and Scrip Holders.*

936 Special meetings of the stock and scrip holders shall be called by the secretary when required to do so by the president or board of trustees, or by stock and scrip holders owning at least one-half in amount of all the capital stock and scrip. Such call shall be made by circular addressed by mail to all the stock and scrip holders whose residence shall be known, to their residence or at their registered address.

XVII.—*Disbursing Officers May be Required to Give Security.*

The treasurer, or any other officer or agent of the company who shall control or disburse the moneys thereof, shall (if the board of trustees or executive committee require the same) give security for the faithful discharge of the duties of such office or agency, and to account for such moneys—which security shall be in such form and amount as said board or committee may require.

XVIII.—*Corporate Seal.*

The corporate seal of the company shall be a circular one with the name of the company thereon, and the word "seal," the impression of which is affixed to the record of these by-laws in the minute book of the company.

{ Impression of }
{ Seal. }

XIX.—*Execution of Documents.*

All deeds, leases and other documents affecting the property of the company, and requiring to be executed under its seal, shall be executed by the president or acting president, and attested by the secretary.

XX.—*Checks.*

No moneys can be drawn from bank or other place of deposit thereof, except by checks signed by the president or vice-president and also by the treasurer.

937 XXI.—*Alteration of By-laws.*

These by-laws may be altered or amended by a vote of not less than two-thirds of the whole number of trustees for the time being at any regular meeting of the board, provided distinct notice of the intention to propose such alteration or amendment shall have been given in the notice calling such meeting, or at the next previous regular meeting when a quorum shall have been present.

The secretary presented a seal, impression of which is on the margin of the minutes, which on motion was adopted as the seal of the company.

On motion, Messrs. Lawrence Myers and Jacob Hays were appointed a committee to supervise and receive the assignments of patents and agreements and to supervise the issue of the stock and scrip of the company in accordance with the resolution adopted.

The committee reported that they had received the assignments of the patents and agreements referred to in the resolution and presented the same to the trustees.

On motion, Messrs. Classon and Hays, of No. 3 Nassau St., New York city, were appointed transfer agents of the company.

Messrs. Wm. H. Hays and Albon Man tendered their resignation of the offices to which they had been elected, and the resignations were accepted, whereupon,

On motion, it was resolved to proceed to ballot to fill the vacancies thus created.

The balloting resulted in the unanimous election of Mr. Albon Man, for president, and Mr. Lawrence Myers, for vice-president.

Adjourned subject to call.

W. E. SAWYER, *Secretary.*

938 Pursuant to call the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co. was held at No. 3 Nassau St., on Tuesday, Sept. 10th, 1878. Present, Messrs. Hugh McCulloch, Wm. H. Hays, Jacob Hays, Lawrence Myers, Albon Man and W. E. Sawyer. The minutes of the previous meeting were read and approved.

The president reported that an informal proposition had been made to him to purchase ten thousand ($10,000) of the scrip of the company which has been set apart as a working capital and stands in the name of Jacob Hays, treasurer, in trust, at the par value thereof; whereupon

On motion of Mr. McCulloch, the president and treasurer were authorized, by a unanimous vote, to sell and transfer ten thousand dollars of the scrip held by the treasurer in trust.

The president further reported that he had expended of his own money and taken vouchers in the name of the company therefor receipted as paid by him to the extent of $729.74, in the preparation of lamps and other electrical apparatus and in the payment of $250 to W. E Sawyer for $1,000 of the scrip of the company, assigned to the company by Mr. Sawyer; and that there is a small bill in addition due to Messrs. Arnoux & Hockhauser, Nos. 2 and 4 Howard St., New York, for work and materials.

On motion it was resolved that the vice-president and treasurer be authorized to act as an auditing committee to audit the accounts when there is money in the treasury to pay the same.

The president further reported that there is a proposition pending for the privilege of placing the lighting apparatus of the company in the Davol mills at Fall River, Mass.

On motion of Mr. Wm. H. Hays the president was authorized in his discretion to make arrangements with the proprietor of the Davol mills.

The president further reported that the company is in need of a

dynamo-electric machine for the proper exhibition of its
939 lighting apparatus, the price of which is $600; whereupon,
on motion of Mr. McCulloch, it was

Resolved, That the president be authorized to order such a dynamo-electric machine as may be needed.

On motion it was resolved that the president be authorized to employ as chemist of the company Prof. F. N. Holbrook, of Columbia college.

On motion it was resolved that the clerk of Mr. Jacob Hays be employed to take care of the books of the company, and to be paid a fair price for his time and services.

Adjourned.

W. E. SAWYER, *Secretary.*

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 3 Nassau St., on Tuesday, Oct. 8th, 1878. Present—Messrs. Wm. H. Hays, Jacob Hays, Lawrence Myers, Albon Man and W. E. Sawyer.

The minutes of the previous meeting were read and approved.

The president reported:

1st. That he had made arrangements with Mr. Wm. C. Davol, Jr., treasurer of the Davol Mills of Fall River, Mass. [at the expense of the mill Co.]* to equip the said mills at the expense of the mill Co., with the electric lighting apparatus of the Electro-Dynamic Light Co., the mill Co. to pay a royalty of one hundred dollars per annum for the use of the same and as an acknowledgment of the patents and rights of this company.

2d. That the apparatus of the company is substantially complete for exhibition.

3d. That the present workshop of the company is unsuitable
for the exhibition of the light and experimental purposes.
940 On motion of Mr. Jacob Hays, it was resolved—
That the president be, and hereby is, authorized to procure suitable quarters for manufacturing and exhibiting the apparatus of the company.

On motion it was resolved—

That the president and treasurer be, and hereby are, authorized to pay W. E. Sawyer at the rate of fifty dollars per week as electrician of the company.

On motion of Mr. Wm. H. Hays, the president was authorized to procure letters patent of the United States upon new inventions as speedily as he may deem it necessary.

On motion, the president was authorized to employ Mr. E. L. Myers as chemist of the company in place of Prof. Holbrook.

Adjourned.

W. E. SAWYER, *Sec'y.*

At a special meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 3 Nassau St., on Tuesday, Oct. 15th,

---

*Erased in book.

1878, notice to attend which was sent to all. Present—Messrs. Hugh McCulloch, Wm. H. Hays, Jacob Hays and Lawrence Myers. The president being absent, Mr. Myers, vice-president, was called to the chair. Mr. Jacob Hays acted as secretary *pro tem.*

On motion of Mr. Wm. H. Hays, the president was authorized to exhibit the electric light wherever he may deem proper for the interests of the company.

On motion of Mr. McCulloch, the president was authorized to procure letters patent in foreign countries upon the inventions owned by the company, provided the expense of procuring such letters patent can be paid by sale of stock of the company.

Adjourned.

W. E. SAWYER, *Sec'y.*

941 At a special meeting of the stockholders of the Electro-Dynamic Light Co., held at No. 3 Nassau St., on Thursday, Oct. 31st, 1878, notice to attend which was sent to all, present Messrs. William H. Hays and Jacob Hays, Hugh McCulloch, Lawrence Myers, Jas. P. Kernochan, Albon Man, W. E. Sawyer, Wm. H. Church and H. L. Judd, the president in the chair, the secretary read the following communication from Mr. G. P. Lowery:

Porter, Lowery, Soren & Stone, attorneys and counsellors at law,
No. 3 Broad street (Drexel building).

NEW YORK, *Oct. 30th,* 187–.

P. O. box 1836.

DEAR SIR: Referring to my visit to 94 Walker St. this morning, I think it desirable to repeat to you more deliberately than may be done in a hurried conversation, that the field of electric lighting is so vast and promises such great results, that good business men would commit a great error if they should allow themselves to become, in the outset, involved in any uncalled-for struggle for the possession of the whole field, and a small part of it would be enough for all.

As I said to you this morning, the suggestions which passed between us, arising apparently in both our minds out of the same practical considerations, were not intended by me to express the opinions of my associates, for I had not seen any of them since reading in the morning paper the announcement of the Sawyer-Man light; nor do I understand what you said as in any way committing you, except to the general proposition, that it was always in these matters wiser to unite strong parties than to divide them and leave them to expend their strength in opposition.

I want to repeat, therefore, that I shall be at all times in favor of considering more carefully the general ideas which we mutually expressed, and that without any very great reference to the question who would or who would not succeed in the final contest.

942 As I understand it, you have not a correct idea of Mr. Edison's light; in fact, he has not allowed any one to know what his invention consists of, but I understand that you have what is apparently to me a very good light, and even if we were

able to sustain both rival patents, we should be competitors, which itself would be commercially a great mistake.

I have already described to one of the directors of our company what I saw of your light, and I shall mention our conversation to others as I shall chance to meet them.

You will be glad to hear that a telegram from Menlo Park this morning informed me that Mr. Edison slept twelve hours last night without pain and is therefore out of the difficulty which has prevented him from working for the last few days.

I presume that your foreign patents are taken out and I think there is a much greater field over there than here, and also if there should be a practical union of these interests in any way it would be enormously to the advantage of both, on the other side, to be represented by the same strong banking house or houses.

Very truly yours,

(S'd) G. P. LOWREY.

Albon Man, Esq., 94 Walker street, city.

On motion, Messrs. Hugh McCulloch, Wm. H. Hays and the president of the company were appointed a committee to confer with Mr. Lowery in relation to the subject-matter of the foregoing communication.

Adjourned.

W. E. SAWYER, *Sec'y.*

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co. held at No. 94 Walker St. on Tuesday, Nov. 12th, 1878, at 4 o'clock p. m. Present—Messrs. Albon Man, Jacob Hays, Lawrence Myers and W. E. Sawyer.

943 The reading of the minutes of the previous meeting was dispensed with.

The president reported that he had received two more letters from Mr. G. P. Lowrey, which the secretary read as follows:

NEW YORK, *Nov. 2d*, 1878.

DEAR SIR: I have this moment received your letter, which however I have not time to read as I am going out.

I was surprised this morning to hear that my letter to you was being spoken of as an advance towards a consolidation of our company with yours. I am sure you cannot have made such a mistake. At any rate, if such an impression was derived from what I wrote, there was no such specific purpose in my mind, and I desire to correct it now and to add that I have not the slightest idea that the Edison Electric Light Co. would entertain any such proposition from you, and certainly they would not make it.

It is one of the dangers of private intercourse that it is liable to these misconstructions.

Very truly, G. P. LOWREY,
By K.

Albon Man, Esq., 94 Walker St.

NEW YORK, *Nov. 6th*, 1878.

DEAR SIR: I received your letter of Oct. 31st just as I was leaving my office. I had time to glance at the first page of it hastily, and then thinking I might not have another opportunity for several days, I dictated to my stenographer my letter to you of November 2d, and left it to be written out and signed by him for me. I have just this morning returned to the city and take the first opportunity to make a more formal reply.

I adhere to the general ideas of policy which I expressed
944 to you in conversation and in my former letter. I do not
think the matter is in any situation, however, to require the present consideration of whether or not we are likely to be rivals, and as such injurious to each other. That time may very likely come and perhaps soon, and as one of those interested in Mr. Edison's patents I shall be ready and disposed towards whatever may seem to be required by good business judgment.

I should not allude to any possible contest between our patents except from your having expressed a belief (very proper from your standpoint) that "Mr. Edison's light, if put in operation, must in the end pay tribute" to you.

I am entirely satisfied that the most exhaustive search of what has been done by others will show that Mr. Edison has produced a perfectly novel invention.

Very truly yours, G. P. LOWREY.

Albon Man, Esq., 3 Mercer St., city.

The president stated that he had made no reply to either of these letters and did not consider any necessary.

The letter of Oct. 31st, written by the president, referred to in Mr. Lowrey's communication of Nov. 6th, was presented and read as follows:

(Copy.)

NEW YORK, *Oct. 31st*, 1878.

DEAR SIR: I have to acknowledge the receipt this afternoon of your letter to me of Oct. 30th inst. We feel very confident of the success of our inventions and the stability of our patents. Some of your people, and if we are not mistaken from Mr. Edison's own laboratory, have seen our light and can attest its excellence, as can also a vast number of people who have thronged to see it. Of course we have not made public all that we have done, nor do we suppose that Mr. Edison has done so, but we do distinctly claim that we are
the inventors of all that we use, and that we can show our
945 priority over Mr. Edison and every one else in these inven-
tions, and we cannot but feel from what we see published that many of these inventions are essential to the successful working of Mr. Edison's light.

If we are right, Mr. Edison's light if put in operation must in the end pay tribute to us. At the same time, my dear sir, we do not claim to be all the world, nor to contain all the wisdom of it, nor to know in advance all that has been and will be found out about lighting by electricity. Permit me just here to pay what is but just tribute to the ability, skill and inventive talent of Mr. Edison, and to admit that his well-known character in this respect is a great advantage to those attempting to bring his inventions before a public whose confidence in him as an inventor is great. I admit at the same time the high character, standing and wealth of your associates, as you must that of those who are associated with us. I do not permit myself for a moment to think that either you or those associated with you would think of attempting to deprive us by litigation or otherwise, of our just rights, notwithstanding any inference to the contrary that might be drawn from your letter. Having thus cleared the ground I have to say that I can see no ground of objection to a union of interests that should do away with intagonism if a fair basis for such union can be found. But on the contrary, I can see and I have no doubt the eminent business men who are associated with us in interest would also see that great advantages might be derived to both companies from such a union.

If you will bring about the appointment of a proper committee from your company for the purpose, I will see to it that representatives from our company shall meet them as soon as you advise me for the discussion of the subject. The matter may be informal, if you desire it, at first.

I am happy to hear of Mr. Edison's improved health.

In the matter of foreign patents I believe we are all right.

Very respectfully yours, ALBON MAN.

946 G. P. Lowrey, Esq., Drexel building, cor. Wall & Broad Sts., N. Y.

The treasurer reported as follows:

Receipts from sales of stock and scrip, $2,616; money loaned by Mr. Albon Man, $600; excess of salary paid Edwin L. Myers, $20.

Total receipts, $3,236.

Total expenditures to Nov. 12th, $2,224.21.

Balance in bank, $1,011.79.

$26,600 scrip in treasury.

The treasurer's report was accepted and placed on file.

The treasurer further reported that for the $600 borrowed for the company from Mr. Man, the vice-president and treasurer have signed a demand note.

On motion the action of the vice-president and treasurer was approved.

On motion the president was authorized to pay the bill of Edward P. Hampson for a steam engine put up at the company's workshop, amounting to $401.55, subject to the acceptance of a proposition by said Hampson to replace the present engine by a larger one costing $1,065.

Adjourned.

W. E. SAWYER, *Sec'y.*

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 94 Walker St., on Thursday, Dec. 12th, 1878, adjourned from the 10th; present, Messrs. Hugh McCulloch, Wm. H. Hays, Jacob Hays, Lawrence Myers, Albon Man and W. E. Sawyer, the president in the chair.

The minutes of preceding meetings were read and approved together with the interlineations in the minutes of the special meeting of the board of trustees, held Oct. 15th.

The president reported that he had received from W. E. Sawyer an assignment to the company of seven different applications for patents, which he presented as follows:

947 Electric lamps,	filed	Dec. 2d.
Do. do.	"	Nov. 30.
Do. do.	"	Nov. 19.
Thermo lamp,	"	Nov. 25.
Electric lighting apparatus,	"	Nov. 19.
Electric lighting apparatus,	"	Dec. 2d.

On motion the treasurer was directed to have the assignment recorded in the Patent Office at Washington.

The president reported that at a special meeting of the board, held Oct. 15th, on motion of Mr. McCulloch, the president was authorized to procure letters patent in foreign countries upon the inventions owned by the company provided the expense of procuring such letters patent can be paid by sale of stock of the company; that he was unable to make such sale of stock, and that therefore the company had not become the owners of the foreign patents and had no interest whatever therein.

The report was accepted, approved and ordered to be placed on the minutes.

The treasurer reported to Dec. 10th balance in bank $737.79.

The report was approved and accepted.

The treasurer further reported that the company had borrowed of Albon Man $500 on a demand note signed by the vice-president and treasurer; and that the company had borrowed of Jacob Hays $600 for which a demand note had been given by the president and treasurer.

On motion of Mr. McCulloch the action of the president and vice-president in borrowing $500 of Mr. Man and $600 of Mr. Hays was approved.

On motion of Mr. McCulloch, it was—

Resolved, That Lawrence Myers be appointed superintendent of the company with full power to supervise and direct its business with a view to pushing forward the construction of lamps and other apparatus necessary for practical work under the patents owned by the company; to sell and dispose of the stock or scrip of the
948 company; to communicate and correspond with parties that may desire to become purchasers of the right to use the inventions secured by the patents; and to do whatever in his judgment may be necessary to advance the interests of the company in conference with the president, secretary and treasurer.

Adjourned.

W. E. SAWYER, *Sec'y.*

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 94 Walker St., on Tuesday, Jan. 14th, 1879, present Messrs. Hugh McCulloch, Jacob Hays, Lawrence Myers, Jas. P. Kernochan, Albon Man and W. E. Sawyer, the president in the chair, the minutes of the previous meeting were read and approved.

Adjourned.

W. E. SAWYER, *Sec'y.*

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 94 Walker St., on Tuesday, Feb. 18th, 1879; adjourned from Feb. 11th, present, Messrs. Hugh McCulloch, Jacob Hays, Jas. P. Kernochen and W. E. Sawyer, Mr. McCulloch in the chair, the minutes of the previous meeting were read and approved.

The report of the treasurer was presented and ordered to be read at the next meeting.

On motion, it was

Resolved, That the president and secretary be and hereby are authorized to furnish lamps to applicants upon such terms as may be agreed upon between them and the applicants.

Adjourned to meet at No. 3 Nassau St., on Tuesday, Feb. 25th, at 3 o'clock p. m.

W. E. SAWYER, *Sec'y.*

949 At an adjourned meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 3 Nassau street, on Tuesday, Feb. 25th, 1879, present Messrs. Hugh McCulloch, Wm. H. Hays, Jacob Hays, Lawrence Myers, Jas. P. Kernochan, Albon Man and W. E. Sawyer, the president, in the chair.

The minutes of the previous meeting were read and approved.

The report of the treasurer was passed over to the next meeting.

The president presented the following paper which was read by the secretary:

"New York, *Feb.* 13, 1879.

"It has been agreed by Mr. Sawyer with Mr. H. L. Judd that Mr. Judd should go on at his own risk and cost to make an electro-dynamic machine of the kind invented by Mr. Sawyer upon the understanding that he, Judd, should have ¼ the interest in the invention both in the United States and foreign countries and should be employed to make the machines for this country for the Electro-Dynamic Light Co. at reasonable prices and exclusively for use in the U. S. But Mr. Sawyer, having before then assigned the invention to said company for this country it is understood that he was acting for said company, subject to its approval, it being also understood that proper provisions would be inserted in the agreement between Mr. Judd and the Co. for preventing licensing by his ¼ interest, without approval of the Co. or its officers and for joint account of the owners.

"I personally approve this arrangement and will in good faith seek to have it approved and carried out by the Electro-Dynamic

Light Co., and have conversed with the other directors, or most of them, who also promised to vote to carry it out.

"(Signed) ALBON MAN.
W. E. SAWYER."

950 On motion the action of the president and secretary in the foregoing arrangement was unanimously approved.

On motion the president and treasurer were authorized to borrow of all the trustees, excepting the secretary, the sum of $500, in proportion to their respective interests.

Adjourned to meet at the same place on Tuesday, March 11th, at 3.30 p. m.

W. E. SAVAGE, *Sec'y.*

NOTE.—Minute of meeting of March 20, 1879, copied in evidence above.

At the regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 3 Nassau St., on Tuesday, April 8th, 1879, at 3.30 p. m. Present, Messrs. Hugh McCulloch, Wm. H. Hays, Jacob Hays, Lawrence Myers, Jas. P. Kernochan, Albon Man, and W. E. Sawyer; the president in the chair.

The minutes of the previous meeting were read and approved, a part of the minutes on page 53 having first been amended to read as follows:

951 "The secretary was requested to state in the minutes that the feeder-lamp invention made by him at the expense of the company is the property of the company for the United States, to which he hereby agrees and assents, and will make all necessary assignments, provided the company procures the patents upon it within a reasonable time."

The treasurer reported as follows:

Balance in bank, $2.61.

Total liabilities, $3,666.69, of which amounts there is due:

Albon Man	$1,862 50
Jacob Hays	750 00
Hugh McCulloch	150 00
W. H. Hays	150 00
Lawrence Myers	150 00
J. P. Kernochan	150 00
Classon & Hays	141 97

Adjourned.

W. E. SAWYER, *Sec'y.*

A special meeting of the board of trustees of the Electro-Dynamic Light Co. was held at 94 Walker St., on Saturday, April 19th, 1879, at 3 p. m. Present: Messrs. Hugh McCulloch, Jas. P. Kernochan, Jacob Hays, Albon Man, and W. E. Sawyer; the president in the chair.

The reading of the minutes of the previous meeting was dispensed with.

On motion of Mr. McCulloch, the president was authorized to continue the use of the premises at 94 Walker street for a period of one month or longer, not to exceed three months from May 1st.

Bills of Frasse & Co. and Mueller & Neumann were presented and approved.

Adjourned to meet at the call of the president or secretary.

W. E. SAWYER, *Sec'y.*

952 A special meeting of the board of trustees of the Electro-Dynamic Light Co. was held at No. 94 Walker St., on Saturday, April 26th, 1879, at 3 p. m. Present, Messrs. Lawrence Myers, Jacob Hays, Albon Man and W. E. Sawyer—the president in the chair.

The minutes of the two previous meetings, held April 8th and 19th, were read and approved.

The president reported as follows:

"That the interference case with Keith and with Maxim, arising from the application of Sawyer & Man for a patent for manufacturing carbon for electric lights, which has been assigned to the Co., has been proceeded with. The Co.'s attorney, Mr. Broadnax, reports that there is no interference with the claims made in our application for a patent, and that as soon as he can get the testimony of Mr. Maxim (that of Mr. Keith having already been taken and he disclaiming any claim to the invention for which we have applied for a patent) he can make an arrangement with these parties to have our patent issued, they withdrawing any opposition to it. The attorneys for Maxim and Keith have both expressed themselves as satisfied that there is no interference, and the only object in having Mr. Maxim's testimony now is that he may not in the future be permitted to reissue any patent that he might obtain for his supposed improvement in such manner as to interfere with ours, it being understood by Mr. Broadnax that Maxim will disclaim under oath, as Keith has done, any claim to the invention in that form in which we have made it."

The president further reported that the premises at No. 94 Walker street can only be hired temporarily for office purposes only.

The president further reported that he has received an offer of $125 for the engine and boiler belonging to the company, but that W. E. Sawyer has informed him that a Co. is about being formed for the manufacture of telegraphic apparatus which he thinks would be glad to buy the engine, machinery and tools of this Co. at a fair and reasonable price before a great while, and he ad-

vised that they be allowed to remain where they are
953 for the present. If necessity arises, they can be removed to
the store of Gillis & Geoghegan, in Wooster street, from
which they can be advertised and sold if the Co. desires.

The report of the president was accepted and ordered to be entered upon the minutes.

The secretary was requested to enter upon the minutes the fact that "at this meeting the room is illuminated by five feeder lamps manufactured by Mr. Sawyer, and all the trustees present are well pleased with the exhibit."

The secretary reported that he has applied for the patent upon the feeder lamp and presented bill of expenses amounting to $51.80.

The application for patent is entitled "electric lamps and switches therefor," and its receipts is acknowledged by a letter from the Commissioner of Patents, dated Washington, April 23d, 1879.

On motion of Mr. Myers, it was unanimously

Resolved, That the bill of W. E. Sawyer, amounting to $51.80, for applying for letters patent upon the feeder lamp, be approved and paid.

The secretary further reported that the Commissioner of Patents requires a model of the invention before taking official action upon the feeder-lamp application; and on motion of Mr. Hays, the secretary was directed to have the model constructed at the expense of the company as quickly and cheaply as possible.

The secretary further reported that the feeder lamp is now complete; that nothing remains to be done except to manufacture and sell lamps and switches; and there being no necessity for further experimenting, he recommended that the workshop of the company be closed and the machinery and tools sold; that the dynamo machines be located in some place provided with steam power; and that an office be hired in which lamps may be charged and kept on exhibition and the electricity be conveyed by wires from the dynamo machines to the office.

The secretary stated that it was impossible for him to make
954 long carbons for the feeder lamps out of materials at hand
and that it was absolutely necessary to order a supply from
France at once.

The secretary recommended *that* the immediate construction of twenty feeder lamps and switches at Mr. Judd's factory, or elsewhere.

The reports, statements and recommendations of the secretary were received and ordered to be entered upon the minutes.

The secretary individually made the following proposition:

That if the members of the board desire to resume the position occupied by them previous to the meeting of March 20th, 1879, at which W. E. Sawyer's proposition to pay off the debts of the Co., etc., etc., was made and accepted, he (Mr. Sawyer) will co-operate with the other members of the board in bringing about that result upon the following basis:

First. W E. Sawyer to be reimbursed for all the moneys expended by him on his own account for the 6 weeks ending April 29th, amounting to $800.

Second. The company to pay him $3,500, and he will assign for the same $3,500 of his stock and scrip in the company, and this sum of $2,500 shall be for his salary as electrician of the Co. for one year.

Third. W. E. Sawyer to have the privilege of buying back the above $3,500 of stock and scrip within one year at par, and he will give his services to the Co. as electrician for the coming year without further consideration.

Fourth. A sale to be made of a sufficient amount of the scrip of the company now in the treasury to provide the sum of $2,500 to be used exclusively for the manufacture of lamps and to pay the expenses of their exhibition, over and above the existing debt of the Co. and other expenses, according to the intention of the secretary in making this proposition.

Fifth. W. E. Sawyer, as electrician of the company, to have exclusive charge and direction for one year of all work connected with the manufacture, charging and putting up of lamps, and all electrical work, subject only to the direction of the board of trustees.

955 Sixth. That an understanding be arrived at respecting the sale of rights, increasing the capital stock of the Co., and admission to the Co. of certain capitalists with whom W. E. Sawyer has been negotiating to carry out his proposition of March 20th.

It was understood by the secretary that decisive action is to be taken upon the foregoing proposition previous to the secretary's departure from New York on Tuesday night or Wednesday morning next.

On motion it was resolved that the secretary's proposition be entered upon the minutes and taken under consideration.

Adjourned to meet at the call of the president.

W. E. SAWYER, *Secretary.*

The regular monthly meeting of the board of trustees of the Electro-Dynamic Light Co. was held at the office of Classon & Hays, No. 11 Nassau St., on Tuesday, May 13th, 1879, at 3 o'clock p. m., present, Messrs. Albon Man, Lawrence Myers, Jas. P. Kernochan, Jacob Hays, and W. H. Hays, the president in the chair.

Mr. Myers was elected secretary *pro tem.*, and he reported that Mr. Hugh McCulloch desired him to act for him in his absence.

The reading of the minutes of the previous meeting was dispensed with.

The president reported that Mr. W. E. Sawyer believes that he can make an arrangement with Mr. Thomas Wallace, of Ansonia, Conn., to go on and build and sell the lamps of this Co. in lots of six lamps or less and to pay the Co. a royalty of three dollars per lamp.

On motion it was

Resolved, That Mr. Albon Man be reimbursed for a dynamo-electric machine purchased by him for the company.

956 The president reported that he had sold the Co.'s steam engine for $165, and odds and ends of no further use to the Co. for $30.69, and that he has stored the remainder of the property of the Co. in a store-room over his own office; that he has paid out bills against the Co., for which vouchers are rendered $86.98, leaving in the hands of the treasurer $108.71.

The president further reported that Man & Parsons, lawyers, will accept $250 in payment of their bill.

On motion, it was

Resolved, That Mr. Joseph Tait be paid $200 for keeping the books of the Co. for one year from July 15th, 1878.

Adjourned to meet at the same place on Wednesday, May 14th, 1879, at 2.45 p. m.

W. E. SAWYER, *Secretary.*

At an adjourned meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 11 Nassau St., on Wednesday, May 14th, 1879. Present: Messrs. Albon Man, W. H. Hays, Jacob Hays, Lawrence Myers, J. P. Kernochan and W. E. Sawyer. The president in the chair. The minutes of the meeting held April 26th, 1879, and of the meeting held May 13th, 1879, were read and approved.

Mr. W. E. Sawyer gave formal notice that he shall not carry out the proposition made by him on the 20th of March, 1879, relative to a reorganization of the company, and that he withdraws such proposition.

Adjourned to meet at the call of the president and secretary.

W. E. SAWYER, *Sec'y.*

At a special meeting of the board of trustees of the Electro-Dynamic Light Co., held at No. 11 Nassau St., on Tuesday, 957 May 20th, 1879. Present: Messrs. W. H. Hays, Jacob Hays, Lawrence Myers, Albon Man and W. E. Sawyer. The president in the chair.

The reading of the minutes of the previous meeting was dispensed with.

The president stated that the notice of the meeting had been sent to all of the trustees, and said:

"I hold in my hands and present to you, gentlemen, the resignation of Mr. Jas. P. Kernochan, as a trustee of this company."

The letter of resignation of Mr. Kernochan was read by the secretary, as follows:

(Copy.)

"To the president and trustees of the Electro-Dynamic Light Co.

"GENTLEMEN: I beg hereby to offer my resignation as a trustee of the Electro-Dynamic Light Co.

"And hoping that our company may meet with full success under the new organization.

"I am truly yours, JAS. P. KERNOCHAN.

"New York, 19 May, 1879."

On motion of Mr. Jacob Hays the resignation of Mr. Kernochan was accepted, and on further motion of Mr. Hays, Mr. Thomas Wallace was unanimously appointed a trustee of this company in place of Mr. James P. Kernochan, resigned.

Mr. Wallace being present the president formally notified him of his appointment, and Mr. Wallace accepted the position.

The president also presented the resignation of Mr. W. H. Hays as one of the trustees of the Co., and the letter of resignation was read as follows:

(Copy.)

"To the president and trustees of the Electro-Dynamic Light Co.

"GENTS: I beg hereby to offer my resignation as a trustee 958 of the Electro-Dynamic Light Co., & hoping that our company may meet with full success under the new organization.

"I am truly yours, W. H. HAYS.

"New York, May 19, '79."

On motion of Mr. Jacob Hays, the resignation of Mr. Wm. H. Hays was accepted.

On further motion of Mr. Jacob Hays, Mr. Uri T. Hungerford was unanimously appointed a trustee of this company in place of Mr. Wm. Hays, resigned; and the secretary was directed to notify Mr. Hungerford of his appointment.

The president then formally tendered his resignation as president of the company, while thanking the board for the courtesy and appreciation of his services uniformly shown him.

On motion of Mr. Jacob Hays, the resignation of Mr. Man as president was accepted; and Mr. Man having, before the acceptance of his resignation, appointed Messrs. Jacob Hays and W. E. Sawyer tellers to receive and count the ballots for his successor, balloting for a new president of the company was on motion proceeded with, and the tellers reported as follows:

For Mr. Thomas Wallace as president, four votes and one blank.

Mr. Wallace being then declared duly elected president of the company in place of Mr. Albon Man resigned, briefly thanked the gentlemen present and took the chair.

Mr. Man then said:

"Mr. President and gentlemen of the board of trustees, I hold a promissory note of Mr. Thomas Wallace for $5,000, given to the treasurer of the Electro-Dynamic Light Co in payment for scrip contributed by the former trustees of the company for the purpose of paying off the debts of the company. We have received this note with the understanding that it shall not be discounted or go out of the hands of the treasurer or his house, in some way, 959 so that Mr. Wallace can, at any time, take it up; but it is desired that the affairs of the company be closed up, and to that end I move that the treasurer be authorized to apply this note to the extinguishment of the debts of the company."

The president declared that such a course would be satisfactory to him, and on motion it was—

Resolved, That the note of Mr. Thomas Wallace for $5,000 be used for paying off the debts of the company.

Mr. Man then said:

"The question arises, gentlemen, in regard to going on with the manufacture of our lamps. I suppose that, in accordance with Mr. Sawyer's understanding, Mr. Thomas Wallace, or his house, proposes to go on and build a lot of these lamps and put them out experimentally."

The president said in reply:

"My idea of this matter was that the house that I am connected with—Wallace & Sons, who are fitted up for this electrical work—should add this lamp to the business they are already doing in this direction; that they should use their present machinery for manufacturing, and facilities for introducing this lamp as widely and generally as it is possible to do, and that the connection between that house and the company would be that they should pay for every lamp made and sold a royalty to this company. That will simplify the business of this company. It is simply to receive a royalty, have correct books of account kept and sworn statements made, and the royalties paid right into the company, and that is according to the understanding I had with Mr. Sawyer, and I presume it has been so understood. Mr. Sawyer asked me to look the matter over and I thought, myself, after looking the thing over carefully, that three dollars per lamp would be about the proper royalty to be paid. I should be satisfied to pay that royalty. I should be satisfied as a stockholder of this company and as a stockholder of Wallace & Sons."

On motion of Mr. Man it was then unanimously—

960 Resolved, That Wallace & Sons be authorized to build and put up the lamps and other apparatus of the company, paying to the company a royalty of three dollars per lamp for such lamps as they shall put up until some further and more positive arrangement can be made.

A bill of H. L. Judd & Co. of $60 for work and materials was presented, approved and ordered to be paid as soon as there shall be sufficient funds in the treasury.

Mr. Man then presented the resignation of Mr. Lawrence Myers as a trustee of this company, carrying with it his resignation as vice-president of the company, and the letter of resignation was read as follows:

(Copy.)

"New York, *May 19th*, 1879.

"To the president & trustees of the Electro-Dynamic Light Co.

"Gentlemen: I beg hereby to offer my resignation as a trustee of the Electro-Dynamic Light Co. & hoping that our company may meet with full success under the new organization.

"I am, truly yours, L. MYERS."

On motion of Mr. Jacob Hays the resignation of Mr. Myers was accepted, and on motion of Mr. Man

Mr. John B. Wallace was appointed a trustee of this company in place of Lawrence Myers, resigned.

The secretary was directed to notify Mr. Wallace of his appointment.

On motion of Mr. Man the board proceeded to the election of a vice-president to fill the vacancy occasioned by the resignation of Mr. Myers, and the tellers, Messrs. Hays and Sawyer, reported as follows:

That three votes had been cast for Albon Man and one blank, and Mr. Man was declared duly elected vice-president of the company.

961 Adjourned to meet at No. 11 Nassau St. on the second Tuesday of June next, at 3 o'clock p. m.

W. E. SAWYER, *Sec'y.*

The regular monthly meeting of the board of trustees of the Electro-Dy*m*amic Light Co. was held at No. 11 Nassau St. on Tuesday, June 10th, 1879, at 3 o'clock p. m. Present: Messrs. Thomas Wallace, Uri T. Hungerford, Albon Man, Jacob Hays and W. E. Sawyer. The president in the chair.

The reading of the minutes of the two previous meetings was dispensed with.

Mr. Dow, attorney for Messrs. Wallace & Sons, of Ansonia, Conn., presented and read the draft of a license between this company and Messrs. Wallace & Sons, and on motion, Messrs. Hugh McCulloch, Albon Man, Jacob Hays, Thomas Wallace and Uri T. Hungerford, were unanimously appointed a committee to draw up such a license as this company is willing to give Messrs. Wallace & Sons for the right to manufacture and sell lamps under the company's patent; and the vice-president, Mr. Albon Man, was unanimously authorized to sign such license on behalf of the company.

Adjourned.

E. W. SAWYER, *Sec'y.*

Defendant's counsel objects to the answer of the witness on the same grounds as stated in his objection to the question, and gives notice that before or at final hearing he will move to strike the same from the record.

Cross-examination closed.

HUGH R. GARDEN.

Sworn to before me this 12th day of March, 1889.

JOHN H. KITCHEN, *Examiner.*

962 WEDNESDAY, *March 13th*, 1889—11 a. m.

Met pursuant to adjournment.

Pursuant to written notice complainant's counsel produces the original letter written by William D. Baldwin to Thomas Wallace, president of the Electro-Dynamic Light Co., bearing date New York, January 8th, 1880.

It is stipulated by and between counsel that said original letter may be copied by the examiner upon his minutes, and that such copy may be used at the hearing of this cause with the same force and effect as the original letter.

The original letter to be produced at the hearing if the defendants shall require the same.

It is further stipulated and admitted by complainant's counsel that said original letter was written on the day of its date, to wit, January 8th, 1880, and that the same was at that time delivered into the custody of the Electro-Dynamic Light Company and in whose possession it has since remained.

It is also admitted that Thomas Wallace was the president of the Electro-Dynamic Light Co. prior to and on the 8th day of January, 1880.

The following is the letter referred to and is filed and marked Exhibit "Baldwin-Wallace Letter, January 8th, 1880:"

"NEW YORK, *January 8th*, 1880.

"To Thos. Wallace, pres't Electro-Dynamic Light Co.

"SIR: I have this day prepared an application for patent of the arch form of incandescent carbon electric lamp, made by William E. Sawyer and Albon Man as joint inventors, containing a request for the issuing of such patent to your company, and have prepared and hold for filing and record at Washington an assignment of the same to the Electro-Dynamic Light Company.

963 "I acknowledge myself to be the attorney in this matter of said company and subject in all things to its direction with power in them to revoke my authority at any time.

"The expenses and my charges are to be paid by Mr. Charles A. Cheever, who has in contemplation the purchase of said patent or the invention to which the application relates and no charges are to be made by me against your company, except for such services as may be rendered after Mr. Cheever shall have failed to make purchase and as shall have the approval of the company. I will not make any alteration in the claims or specification of said patent enlarging its scope beyond its intended purpose of covering the arched or angular form of the carbon used for incandescent electric lights.

"Yours truly, WM. D. BALDWIN."

Adjourned to 3 p. m.

3 p. m.—Adjourned by consent to Thursday, March 14th, 1889. at 10 o'clock a. m.

FRIDAY, *March 15th*, 1889—11 a. m.

Counsel for defendant offers and files in evidence stipulation made between counsel dated March 14th, 1889, marked Exhibit "Interference Stipulation," and requests that the same be copied on the minutes. The stipulation is as follows:

The complainants, by its counsel, hereby stipulates and consents that the defendant may introduce and file in evidence at or before the closing of its proofs in this suit, and as a part of said proofs the deposition of any witness examined in the interference (Sawyer & Man *vs.* Edison), with the right on the part of either party to recall any such witness for further examination or cross-examination, and also defendant may introduce and file in evidence in this 964 suit any exhibits contained in said interference record. Such depositions of witnesses to have same force and effect as if the witnesses had been regularly called, sworn and examined herein, and such exhibits to have same force and effect as originals properly proven, introduced and filed in this suit, subject to objection as to competency and materiality.

This stipulation to be without prejudice to the claim of the complainant that it has already well and sufficiently introduced the entire interference record in evidence, and that the same is now a legal part of the complainant's case herein.

Dated New York, March 14th, 1889.

THOMAS B. KERR,
For Complainant.
H. D. DONNELLY,
For Defendant.

Adjourned to March 15th, at 11 a. m.

N. Y., March 15th, 11 a. m.—Adjourned to March 18th, 11 a. m.

N. Y., March 19th, 2 p. m.—Adjourned to March 20th, 11 a. m.

N. Y., March 20th, 11 a. m.—Adjourned to March 21st, at 11 a. m.

Testimony in Edison vs. Sawyer-Mann Interference, Offered under Stipulation of March 14th, 1889.

MARTIN N. FORCE, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. What is your residence and occupation; by whom are you employed, and how long have you been so employed?

965 A. My residence is Menlo Park, N. J. My occupation is assisting Mr. Edison in his experiments. I have been so employed since about 1875.

2 Q. What sort of work did you first do for Mr. Edison?

A. I did carpenter work.

3 Q. If you did any particular carpenter work for him in relation to the laboratory, please state what it was and when it was done?

A. I helped to erect the laboratory, putting up shelves in the same, and I did carpenter work at his pen factory; about in the fall of '75 and the spring of '76.

4 Q. If at any time you changed the nature of your *your* work for Mr. Edison, what new work did you enter upon, and when did you do so?

A. I was at the pen factory packing the pens, and some of the time I ran the engine. Then I went in the laboratory to assist in the laboratory, about the spring of '78. My duties were anything I was asked to do; assisting at making and charging batteries, cleaning the laboratory and such work. And since that time my work has been general in the laboratory, assisting wherever I was called upon.

5 Q. Please examine the paper now shown you, marked Edison's Exhibit No. 5; state whether the signature M. N. Force upon the same is your signature, and when was the same made?

Question objected to as going to show that the invention in question was made before the date alleged in the preliminary statement of Mr. Edison.

A. I have examined the paper; the signature is mine. It was made at the date of this paper, December 3d, 1877.

6 Q. Please look at exhibit, marked Edison's First Incandescent Lamp, and state whether you have seen the same before, and if so, when and where?

Same objection as to previous question.

966 A. I have looked at the instrument. I have seen it in the laboratory at Menlo Park. I have seen the instrument setting on the shelf at the upper part of the laboratory. I should say it was about three years ago, as near as I can remember.

7 Q. Have you assisted at any experiments in electric lighting with incandescent paper carbons or witnessed such experiments at Menlo Park? If so, state the earliest times of the same.

A. I assisted Mr. Batchelor about September or October, 1878, I don't exactly know which, to make some carbons. The carbons were rolled with a sort of a coating of tar, and carbonized in a crucible filled with charcoal or something of that description, and also carbonized in a combustion tube. As near as I can remember at that time they were put in the bell jar of a vacuum pump. The air was then exhausted, and an electric current passed through the carbon.

7½ Q. Please examine the paper now shown you marked Edison Exhibit No. 9. State whether or not the sketches on that paper represent the bell jar employed in the experiments you have related.

A. I have examined the Exhibit No. 9, and find it to be, as near as I can remember, a drawing of the vacuum pump which we used at that time.

Counsel for Edison gives notice that he here closes his examination-in-chief of this witness, and gives him over for cross-examination.

Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

Counsel for Sawyer and Man gives notice that his cross-examination is not intended to waive any objection taken to the testimony.

8 X Q. Did you sign your name on this paper, Edison Exhibit No. 5, in presence of Mr. Edison and Mr. Batchelor?

A. Yes, sir.

967 9 X Q. Where were they?

A. In the laboratory, at Menlo Park.

10 X Q. Was it in the morning or in the evening?

A. In the evening.

11 X Q. Was it by gas-light or by daylight?

A. I don't exactly remember whether it was by gas-light or by daylight.

12 X Q. What was the object of making that paper?

A. As a record, I suppose, of the experiment.

13 X Q. What experiment?

A. The experiment shown on the paper.

14 X Q. In whose handwriting is this paper?

A. It looks like Mr. Edison's handwriting somewhat.

15 X Q. Did you see him write it?

A. I do not remember seeing him write it.

16 X Q. Can you swear that this is his handwriting?

A. No, sir; I wouldn't swear that it's his handwriting.

17 X Q. Can you swear that that paper was written December 3d, 1877?

A. No, sir; I wouldn't swear that it was written at that date, of course.

18 X Q. Can you swear that you signed your name on it on December 3d, 1877?

A. I can swear that that's my signature.

19 X Q. Can you swear that you made this signature on December 3d, 1877?

A. I made that signature at that time; yes, sir.

20 X Q. How do you fix the date of the making of that signature on that paper?

A. I have no particular way of fixing the date, but generally at the time an experiment is tried we always sign, and I never sign unless I see the experiment.

21 X Q. Did you witness the experiment referred to on that paper?

A. Yes, sir; I was there at the time, but I don't know the details of the experiment.

22 X Q. What was intended to be proved by the experiment?

A. I couldn't say what he intended to prove.

968 23 X Q. What did the experiment consist of? What did he do?

A. I don't remember. I can't give the details of the experiment.

24 X Q. How do you know that the experiment referred to on that paper was made on or about December 3d, 1877? What circumstance can you mention that was contemporaneous with that experiment?

A. I don't know that I have anything particular to call the same to my mind. I used to frequent the laboratory to see them experiment, but did not enter into the details of the experiments. There is no particular circumstance that I recall to my mind.

25 X Q. Did you see Mr. Edison make any experiments with the Exhibit Edison's First Incandescent Lamp?

A. No, sir; I don't remember seeing any.

26 X Q. You say you assisted Mr. Batchelor to make some carbons out of paper coated with tar. Did you mean to be understood as saying that the carbon you assisted Mr. Batchelor to make was in the form of a knitting needle?

A. The carbons that I assisted Mr. Batchelor to make were rolled by the hand, coated with tar, and in the form of a small cylinder.

27 X Q. How big were they?

A. They were different sizes. They may have been the size of a quill, or the size of a finger, or smaller.

28 X Q. How much smaller were they? Were any of them as small as an eighth of an inch in diameter?

A. I don't just remember the sizes, and couldn't say as to that. We didn't care particularly as to the size.

29 X Q. Can you state how long they were?

A. They may have been an inch, or two inches, or three inches.

30 X Q. How many of them did you make?

A. I would not say as to the number. There may have been ten, or there may have been fifty.

31 X Q. Did you see any of these carbons put in the vacuum chamber of the pump represented by Edison Exhibit No. 9?

969 A. Yes, sir; I think I saw those put in.

32 X Q. Are you sure you saw those carbons put in that chamber?

A. Yes, sir; in a chamber similar to this drawing.

33 X Q. How many did you see put in?

A. I don't just remember the number; I think there were more than one.

33½ X Q. Can you swear that there was more than two put in?

A. I wouldn't swear that there were more than two; there may have been. My memory don't serve me as to that point.

34 X Q. Was you present during the whole of the experiment?

A. I was present with Mr. Batchelor at the carbonizing and at the vacuum pump. I wouldn't say that I was always at that place, but I was usually present.

35 X Q. Did you work the vacuum pump?

A. Yes, sir; I used to do the pumping most of the time.

36 X Q. Did you see these carbons illuminated by the electric current in the vacuum chamber of the pump?

A. Yes, sir; I remember of seeing them lighted.

37 X Q. Did you see more than one of them lighted?

A. I don't say as to the number I have seen lit, but I remember seeing the carbons illuminated in that chamber.

38 X Q. Was there more than one pump in the vacuum chamber of which you saw these carbons placed and illuminated?

A. No, sir; there was only the one pump at that time.

39 X Q. Was there more than one carbon in the chamber at any one time?

A. I don't remember more than one at a time, but there may have been more.

40 X Q. Did the experiments last more than one day?

970 A. I would not say as to that. I don't remember how many days.

41 X Q. Who was present during these experiments besides yourself and Mr. Batchelor?

A. I think Mr. Edison was present. I don't call to mind any others.

42 X Q. Were the experiments continued more than two days?

A. I don't remember how many days. It may have been one or two, or perhaps a week.

43 X Q. Can you swear that these experiments continued for more than two days in the fall of 1878?

A. I would not swear that they were continued more than two days, although they may have been.

44 X Q. Can you swear that they were continued for two days?

A. I think, as near as I can remember, they were continued for that length of time.

45 X Q. When the carbons were illuminated by the electric current, how long did they last?

A. I would not say as to how long they lasted exactly.

46 X Q. Well, about how long?

A. As near as I can remember, they lasted probably a minute, or a couple of minutes, or five minutes.

47 X Q. These paper carbons about which you have been testifying, are they the first which you saw made at Menlo Park by Mr. Edison and Mr. Batchelor?

A. As near as I can remember, they were about the first.

48 X Q. And you are certain that that was in the fall of 1878?

A. Yes, sir; it was in September or October, 1878, to the best of my recollection.

MARTIN N. FORCE.

971 Edward H. Johnson, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows in answer to questions proposed by George W. Dyer, counsel for Edison:

1 Q. State your residence and occupation, and whether or not you are one of the assistants of Mr. Edison, and, if so, how long you have been with him in that capacity.

A. I reside in New York city. My occupation is that of a practical electrical engineer. I have been engaged for the past ten years in practically applying Mr. Edison's inventions in telegraphy, telephony, and now in the electric light, and in such capacity I have been his assistant, not directly employed in his laboratory until September last, but always with the parties who were putting Mr. Edison's inventions on the market. My relations with him and his work were such that I was a very frequent visitor at his laboratory.

2 Q. What, if anything, do you know of the experiments of Mr. Edison in the summer of 1876, in the carbonization of paper for various purposes?

Question objected to in so far as it applies to electric lighting, if it is intended to show that Mr. Edison carbonized paper for that purpose in 1876.

A. In the fall or winter of 1876 I sought to organize a small business for myself under the name of the American Novelty Company, the object of which was to acquire numerous inventions of Mr. Edison, Mr. Batchelor, Mr. Adams, my own, and others, and to put them upon the market. Several such were acquired, namely, Edison's duplicating ink, Edison's battery carbons, Edison's jeweller's engraving machines and others which I cannot now recall. The attempt to form a company to carry on such a business was practically a failure, owing to the lack of funds. I remember, in discussing with Mr. Edison at his laboratory, quite prominent 972 mention was made of numerous articles which he, Mr. Edison, was intending to manufacture of carbon. I cannot now recall all of them in detail, but they were such articles as dishes, small vessels, resistance coils, battery carbons, etc. I remember, on frequent occasions, seeing Mr. Edison carbonizing certain of these articles under pressure, that being the particular feature of the invention. In discussing the matter with Mr. Edison, Mr. Batchelor and Mr. Adams, they informed me that they purposed making such carbons of bituminous coal, paper and wood. My knowledge of the experiments was necessarily confined to information given me at the time by these gentlemen, as I was so occupied in New York that my visits to the laboratory were mainly for the purpose and with the object of consulting with Mr. Edison, and not in assisting him in his experimental work.

3 Q. At what date do you know, of your own knowledge, of Mr. Edison engaging in experiments in the electric light, with incandescent conductors made of paper carbon?

A. I fail to recall now the exact date when I first saw Mr. Edison's paper-carbon experiments.

4 Q. When was your first knowledge of Mr. Edison's experiments in electric lights?

A. In the summer of 1878, on his return from the Colorado scientific expedition, which he had accompanied for the purpose of endeavoring to measure the heat of the corona during the sun's eclipse, with the tasimeter, which he had invented. It is from this date that my recollection runs freely as to Mr. Edison's electric-light work. Prior to that, anything that he did did not sufficiently attract my attention to fix either the date or the experiment on my mind.

5 Q. Since the summer of 1878, what has been your knowledge with regard to persistent and continuous work on the part of Mr. Edison in incandescent electrical lights?

A. That Mr. Edison pursued experimentation in this direction uninterruptedly night and day, from that date to this, with 973 his customary energy and persistence, when fully started in a given direction for a given object.

6 Q. What is the earliest date within your recollection of the employment of paper-carbon conductors for incandescent electric lights by Mr. Edison?

A. I have a not well-defined recollection of witnessing certain experiments with paper carbons for this purpose in the winter of 1878–'79. In the summer of '79 I went to Europe, and saw nothing more of Mr. Edison's experiments until January, 1880, when I visited Mr. Edison's laboratory upon a mission from England, and there saw a large number of paper-carbon lamps in actual operation. I returned to England within a fortnight, taking six of the paper-carbon lamps with me, and did not again visit the laboratory until September 1st, 1880.

Counsel for Edison closes the examination-in-chief of this witness and offers him for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

7 X Q. Please state your name and age, Mr. Johnson.

A. My name is Edward H. Johnson, and my age is 35 years.

8 X Q. Please to fix the date exactly when Mr. Edison returned from the scientific expedition organized to observe the sun's eclipse.

A. I can't fix that date from memory.

9 X Q. Have you any memoranda to which you can refer by which you can fix the date?

A. Not to my knowledge. I do not make it a rule to preserve memoranda or papers of any description.

10 X Q. You say, in answer to question 4 of your examination-in-chief, that the first knowledge you had of Mr. Edison's experiments in electric lights was in the summer of 1878, after his return from the scientific expedition to which I have referred. 974 Please to state whether you derived that knowledge from others or whether you witnessed those experiments yourself.

A. I witnessed numerous experiments myself.

11 X Q. These experiments that you say you witnessed yourself, were they made immediately upon his return from the scientific expedition referred to?

A. I cannot now recollect whether they were or were not.

12 X Q. State how long after his return you witnessed these experiments, as nearly as you can recollect.

A. I am unable to do that, being wholly without other guide to my recollection than my memory that it was immediately upon his return that he began active experimentation on the electric light.

13 X Q. These experiments that you say you witnessed, is your recollection of them sufficiently distinct to enable you to describe them? If so, please do so.

A. No, sir; it is not. I only remember the fact of frequently seeing Mr. Edison and his assistants occupied with them. My interest was not enlisted, and I did not particularly examine into or investigate this branch of the laboratory work.

14 X Q. In answer to question 6 of your examination-in-chief you say you have "a not well-defined recollection of witnessing certain experiments with paper carbons for this purpose in the winter of 1878–'79." Please to state whether your recollection of the experiments referred to by you in that answer is distinct enough to enable you to describe them, and if so, please describe them?

A. My recollection is of seeing a feeble light, and of Mr. Edison remarking that here might grow out something from the American Novelty Company experiments. I cannot say what his exact words were, but this is the purport of them; nor can I describe otherwise the light that was shown.

15 X Q. How often did you witness experiments made by Mr. Edison in incandescent electric lighting with carbonized paper in the winter of 1878–'79?

975 A. I cannot say positively that such experiments as I saw were upon the incandescent principle at all, my recollection of these experiments being too indefinite to enable me to describe either the principle or the method of its application.

16 X Q. State, if you please, when you first saw this exhibit, Edison's First Incandescent Lamp.

A. It is impossible for me to state when I first saw it. Mr. Edison showed me his light on more than one occasion in its earlier stages. I have no recollection of the shape or design of the lamp referred to in your question.

17 X Q. State, if you know, when it was that Mr. Edison invented and made the tasimeter to which you have referred for measuring the heat of the corona of the sun during the expedition to Colorado.

A. I cannot fix the date other than that it was during the time of his telephone experimentation, the tasimeter being an invention coincident with the telephone. It was some time during the latter half of the year '77 or early part of the year '78. This is my best recollection.

EDW'D H. JOHNSON.

John Kruesi, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. State your age, residence and occupation.

A. Age, 38; residence, Menlo Park, N. J.; I am a machinist, at present engaged in the electric tube works at 65 Washington street, New York, as manager.

2 Q. State how long you have been connected with Mr. Edison, and in what capacity?

A. For nearly nine years. About five years as machinist and four years as foreman of the machine shop.

976 3 Q. Please look at the paper which I now hand you, marked Edison's Exhibit No. 4, and state whether the signature J. Kruesi, upon the same, is your own handwriting and when it was made.

Question objected to as immaterial.

A I have examined the paper. The signature is my own handwriting. I think it was made about the time the paper is dated. That is November, 1877.

3 Q. Have you any doubt upon that point?

A. I have no reason to be doubtful about it, but I don't remember when I signed it.

4 Q. What was your habit or practice about signing similar papers?

Objected to as not competent. The question is as to when he signed this paper.

A. I generally signed them within a few days after they were written, or after the instrument was made.

5 Q. What is the earliest date which you remember of Mr. Edison experimenting with electric lights?

A. I am not sure whether it was the summer of '77 or summer of '78.

6 Q. What is the earliest date you remember of his experimenting with paper carbons for electric lights?

A. I don't remember the date when he began. When he experimented with paper carbon was in 1877, but I don't know what the paper carbons were for.

Counsel for Edison here closes his examination-in-chief of this witness, and submits him to counsel for Sawyer & Man for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer & Man:

7 X Q. What experiments did you see Mr. Edison make with paper carbons in 1877?

A. I don't remember any experiments.

977 8 X Q. Was you foreman of Mr. Edison's machine shop and his laboratory, and generally of his mechanical works at Menlo Park?

A. Yes, sir.

9 X Q. When did you commence to be foreman and when did you cease to be foreman?

A. I commenced in December of 1877, and ceased to be foreman in February, 1881.

10 X Q. Do you recollect seeing Mr. Edison make any experiments in electric lighting with carbonized paper during the time that you was foreman?

A. Yes, sir.

11 X Q. When did you first witness such an experiment?

A. The earliest I remember was in 1879.

12 X Q. What time was it in 1879?

A. I think it was in summer.

13 X Q. What was the experiment?

A. Paper-carbon horseshoe, substantially like this in Exhibit Edison's Commercial Incandescent Electric Lamp.

14 X Q. Do you recollect seeing Mr. Edison experiment with carbonized paper in this lamp marked Edison's Exhibit First Incandescent Lamp?

A. I do not recollect it.

15 X Q. State where you first saw that lamp?

A. In Newark, N. J.

16 X Q. When?

A. Before we moved to Menlo Park.

17 X Q. What was it used for?

A. It is used with an air pump for experiments.

18 X Q. Have you seen the lamp frequently since?

A. No.

19 X Q. Did you ever see it in the laboratory at Menlo Park?

A. I recollect to have seen it at Menlo Park; yes, sir.

20 X Q. Whereabouts did you see it in Menlo Park—in the laboratory?

A. Yes; in that building which we call the laboratory.

978 21 X Q. Whereabouts was it kept in the laboratory?

A. I don't know that it ever had a certain place.

22 X Q. Was it in plain sight most of the time?

A. Yes, sir; I think so. Everything was in plain sight. There was nothing stowed away.

23 X Q. During the time that you was machinist, and before you became foreman, was you frequently and constantly going in and out of the laboratory as a workman?

A. Yes, sir.

24 X Q. And the same is true during the time that you was foreman?

A. Yes, sir.

25 X Q. Did you put these binding posts on this lamp, Edison's first incandescent lamp?

A. No; I did not put them on personally.

26 X Q. Did you see them put on?

A. No; I do not recollect.

27 X Q. Do you know who put them on?

A. No; I do not recollect who put them on.

28 X Q. Do you know when they were put on?

A. No.

29 X Q. Who did you have in the machine shop at Menlo Park that done that kind of work during the time that you was machinest there?

A. I had several workmen at that kind of work.

30 X Q. Please to give the names of those workmen, and where they are now?

A. Rudolph Heuse, who is dead. Echron, I don't know where he is. I think his first name was Albert, but am not quite sure. Baer was the name of another. I don't remember his first name, and I don't know where he is.

31 X Q. Referring now to Edison's Exhibit No. 4, do you know in whose handwriting it is?

A. Yes, I recognize it as Mr. Edison's own handwriting.

32 X Q. When was it written?

A. I think previous to that date there, or at the time of that date.

979 33 X Q. Do you know of your own knowledge that it was written then?

A. No, I do not.

34 X Q. Have you a distinct recollection of the experiments referred to by this paper?

A. No, sir.

35 X Q. Have you such a recollection of them as to enable you to state when they were made?

A. No.

36 X Q. At the time you signed this paper, was that piece torn out between your name and Mr. Batchelor?

A. I do not recollect, but I don't think so.

37 X Q. Do you recollect whether anybody else's name was signed between yours and Mr. Batchelor's?

A. I do not recollect.

Cross-examination ended.

Re-examination by George W. Dyer, counsel for Edison:

38 X Q. How early do you remember seeing the lamp, Edison's Exhibit First Incandescent Lamp, with the binding posts on it, and the clamps inside of it?

A. I couldn't state the date. I recollect the lamp from general appearance.

JOHN KRUESI.

Francis R. Upton, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your age, residence and occupation.

A. Age, 28; residence, Menlo Park, N. J.; occupation, manufacturer of electric lamps.

980 2 Q. State whether at any time you went into the employment of Mr. Edison, and what your duties were.

A. I entered the employment of Mr. Edison about November, 1878. I can fix the date exactly by reference to my accounts, and will do so. My first occupation was making a search through the records of electric lighting in the Astor library. When this was completed to Mr. Edison's satisfaction I entered his employ at Menlo Park to assist him in making calculations.

3 Q. What special training or acquirements had you for making such calculations?

A. Before entering college, and while in college, I gave special attention to the mathematical branches. After leaving college I studied two years under Professor Brackett, of Princeton, learning how to use physical apparatus, and becoming proficient in algebra and calculus. After that I spent one year in Berlin in the laboratory of Professor Helmholz.

4 Q. Please state now the particular branches connected with the electric light which come under your immediate supervision after entering the employment of Mr. Edison?

A. In the first place I made such calculations as were in my power regarding the electrical conditions necessary in a system of electric lighting in answer to questions asked by Mr. Edison, as for instance, I have the memorandum December 15, 1878, this problem given to me when I first came into the laboratory: "Example No. 1, 100 lamps, 10,000 ohms," (diagram shows lamps in *in* multiple arc); "100 lamps, 1 ohm" (diagram shows lamps in series). "How much heat in each lamp? Heat=C^2 R. Ans. The same." This problem is an example of the work I had to do. Besides calculations I assisted Mr. Edison in experimenting, translating and keeping records.

5 Q. At the time of entering into the direct employment of Mr. Edison in the latter part of 1878, what, if anything, was he doing in experimenting and perfecting electric lighting?

A. He was experimenting with the platinum spiral lamp
981 with a thermal regulator. I remember helping to measure
the expansion of the heated spiral of platinum. Besides this Mr. Edison was making an extended series of experiments to find the laws of magnetism. He was also studying publications referring to constructions of dynamo machines.

6 Q. I wish to call your attention to experiments connected with determining the laws of resistance as applied to carbons, particularly those made of paper, and the mechanism and apparatus essential for the production of incandescent electric lighting.

Objected to by counsel for Sawyer & Man as impertinent.

A. Mr. Edison had me calculate the size and weight of cables necessary to carry the current to a certain number of lamps of given resistance (my impression is 100 ohms) at various distances from the machine, so that a certain per cent. of the energy in the circuit could be used in the lamps. He also had me construct tables, showing the joint resistance of a number of lamps in multiple arc. Mr. Edison concluded that to make a successful electric lamp it should have in the neighborhood of 100 ohms resistence. He tried a large number of devices for obtaining this resistance from metal wire. At the same time he was carrying on experiments with the telephone. In the course of these experiments with the telephone threads of carbon were made. He had these tested for resistance and found them very high. This suggested to him the possibility of successfully making high resistance carbon lamps. He, with the assistance of Mr. Batchelor, made a large number of lamps with carbon filaments. At that time my attention was more particularly drawn to the vacuum pumps, and the construction of dynamo machines. I was employed in testing the efficiency of Mr. Edison's machine, and did not follow all the experiments that led to the paper loop. I recollect when one

982 of the first successful loops was made. Francis Jehl and I measured the resistance, cold, of the carbon My recollection is that it was about 140 ohms. The carbon was burnt for a number of hours and again tested, and no change found in its resistance. This was repeated several times, burning and testing, until the lamp gave out. I remember that we all felt very much elated at the fact of the carbon not changing its resistance, for it showed that there was no wasting away of the carbon. We then felt that it was possible to make a system of the electric lighting, simply by adding to the life of the lamp, which we have since done.

7 Q. Of what material were the threads or filaments of carbon made, referred to in your previous answer?

A. My impression is, from ordinary sewing cotton. I recollect that Mr. Batchelor procured from the Clark thread works special samples of cotton thread afterward.

8 Q. When did you know of Mr. Edison's experiments on conductors made of carbonized paper?

A. I can only recollect now the finished loop, as mentioned in a previous answer.

9 Q. When, to the best of your recollection, did Mr. Edison determine the prerequisite of high resistance for a successful incandescent electric light?

A. Early in 1879.

10 Q. How early was his attention turned to the production of more perfect dynamo machines?

A. He was experimenting on them before I entered his employ.

11 Q. When, so far as you know, did Mr. Edison turn his attention to improved means for producing a vacuum in electric lamps.

A. The first recollection that I have is when he sent me to Princeton to borrow a Geissler pump. I can't fix the date now, but may be able to do so.

12 Q. Did you at any time, under Mr. Edison's direction, experiment on improved means for producing a vacuum in incandescent lamps, and if so, at what time?

983 A. By his wish I commenced to learn to blow glass. Not succeeding at this, he advertised for a competent glass-blower, and the first glass-blower was a German from New York, and then a young man by the name of Boehm. I worked with these, helping to the best of my ability, in making pumps for producing a vacuum in incandescent lamps. Before September 16th, 1879, pumps had been made that worked satisfactorily.

13 Q. At the time these means of producing vacuum had been determined, had resistance of carbon filaments been determined?

A. I cannot recollect.

14 Q. At this same time had the dynamo machines been satisfactorily perfected?

A. They were perfect enough to make us sure that if a lamp of sufficiently high resistance could be made, it could be used successfully in a system of electric lighting.

15 Q. At what date did Mr. Edison produce an incandescent electric lamp fit to compete commercially with gas?

Counsel for Sawyer & Man objects to the question as immaterial.

A. To the best of my recollection it was in November, 1879, when the stable resistance of a paper-carbon loop was determined.

16 Q. At that time was the system worked out, and the various forms of apparatus essential to carry it into successful use?

Objected to as immaterial.

A. Yes.

17 Q. From the date of your employment by Mr. Edison have you labored constantly and incessantly under his direction in the perfection and production of incandescent lights and the apparatus necessary to make them available?

A. With the exception of about two weeks; yes.

18 Q. When did Mr. Edison first produce for public exhibition his incandescent electric lamps with paper-carbon conductors?

984 A. The next day after the publication of the article in the New York "Herald," which I find here, marked Edison Exhibit No. 2, dated December 21, 1879.

19 Q. Please look at the lamp now shown you, which is marked "Exhibit Edison's Commercial Incandescent Electric Lamp." State whether that represents the character of lamp referred to in your previous answer?

A. Yes.

20 Q. State, if you please, about the extent and kind of use made then and afterwards with that kind of lamp.

A. Wires had been run in the laboratory building. In connection with these chandeliers had been placed so that the light from the lamps could be used while experimenting. Lamp posts were placed on the road to the depot. My impression is that this was all done before December 21st. The dynamo machines were in place. Mr. Edison was waiting for his foreign patents to be issued, I understood, at the time. Wires were also run to my house and to Mr. Edison's house; in one case using a special line of poles, in the other the Western Union poles. The light was used in the hall and two rooms of my house, for all ordinary purposes, and while tests were being made burned continually and without interruption for several weeks, from dark until ten or eleven o'clock. There were, I think, from sixty to over one hundred lamps in the circuit. While the public exhibitions were given my duty was to watch the dynamo machines to see that no harm was done them, and to explain to visitors their working and the working of the light. I had a lamp hung over my dining-room table, which we used regularly to eat by at night. I remember having a dinner party, with one lamp hung over the table giving sufficient light. This was all done within three weeks after that publication.

21 Q. State, if you please, whether the data relating to these lamps were put in your charge. If so, about what time was it?

985 A. Mr. Batchelor started the book giving the hours burned of the lamps. The record of the lamps, I notice, is in Mr. Batchelor's handwriting until January 5th, 1880. After that

time a young man named Herrick kept the record. I helped him at various intervals while he was keeping the record, examining into the accuracy of his records, and checking his figures. The record was kept for Mr. Edison, who wished to know the life of the lamps. If the lamps were scattered it required constant watching to make the record exact. The machines were run during the day and night. When Herrick was absent a slip was left for him giving the number of hours which the machines ran. If any lamp broke notice was given him as soon as discovered. All the lamps were numbered, so that they could be recognized. The record I refer to is that from which Edison Exhibit No. 3 is taken.

22 Q. When did you begin to manufacture lamps especially adapted for incandescent electric lights?

Question objected to as utterly immaterial.

A. About November, 1879.

23 Q. From an examination of the record of lamps before referred to, can you state about the average life of the lamp used in the latter part of 1879 and the early part of 1880 at Menlo Park?

Question objected to as immaterial.

A. I think that so much of the record as is printed is a fair statement, though it does not give several lamps that burnt an exceptionally long time For example, one on the lamp post at the corner of Mr. Thornall's barn, which burnt from 1,400 to 1,500 hours. I recollect this lamp distinctly as giving a bright light. I recollect examining it to see if the number was on it. I have a tabular statement of the life of these lamps, which I will endeavor to find and put in evidence.

24 Q. Did all these lamps about which you have just testified have carbon conductors made from paper?

A. Yes.

986 25 Q. Have you continued the manufacture of such lamps since?

A. Yes.

26 Q. What do you know of the sale to and use by other parties of such lamps—I mean electric lamps with paper-carbon conductors?

A. The steamship "Columbia" was fitted out in May of 1880, I think, with about 150 of these lamps. An exhibition was given while the steamer was at the dock in New York, lighting the saloon and a number of state-rooms.

27 Q. Was any publication made by you about the last of December, 1879, or early part of January, 1880, about the state of perfection at that time of Mr. Edison's inventions in incandescent electric lamps?

A. I wrote an article about that time which was published in "Scribner's Monthly" for February, 1880. This article is a full description of Mr. Edison's labors to that date.

Article produced, put in evidence and marked Edison's Exhibit No. 10.

The exhibit is objected to on behalf of Sawyer & Man as incompetent, irrelevant and immaterial, and not legal evidence in any sense.

28 Q. Mr. Man, in his testimony in this interference, speaks of using "principally ordinary blotting paper" for incandescent conductors for electric lamps. Have you had any experience in the carbonization of ordinary blotting paper; if so, with what results?

A. I have had some experience. Carbons made from blotting paper are easily broken and not as durable as carbons made from compressed paper.

29 Q. Mr. Man further testifies in the same interference of "rubbing down and working out by hand the carbons." Have you had any experience in this kind of manipulation of paper carbons?

A. I have never tried the process mentioned. I should judge it to be extremely difficult.

987 30 Q. Referring to the answer to cross-question 67 on page 18 of the printed testimony of Albon Man, what office would be filled by the interior conductor coated in the manner described?

A. I should say that the paper loop is mostly useful for mechanically holding the solutions with which it is said to be treated, and that the larger portion of the current would be carried by the carbon from the substances with which the loop is treated, so that the greater portion of the light would be given by them. The looser and more porous the paper the less will it carry the current and give the light from itself.

31 Q. I call your attention to your answer to question 23, and ask if Edison's Exhibit No. 3 gives a correct statement of the life of the lamps therein recorded as not destroyed, and ask you to supplement the history of the lamps which were not destroyed, so as to show their full duration.

A. So far as it goes it is correct, but on examining the records I find that the lamps are continued in another book, for example, lamp No. 159 is continued in Book No. 74, copying the original record and carrying the record to January 30th, 1880. The lamp is shown to have a life of 683 hours and 45 minutes.

Lamp 223, which is copied on page 3, burned 367 hours and 17 minutes.

Lamp 155 is recorded as burning 562 hours, 14 minutes; 201 is recorded as burning 638 hours. Lamp 164 is recorded as having burned 640 hours, 14 minutes. Lamp 172 is recorded as burning 638 hours and 14 minutes. I find these memoranda on pages 1 and 2, page 5, 7 and 8, 9 and 10, 11 and 12, pages 13 and 14, respectively.

Counsel for Edison tenders the above record book for examination to counsel for Sawyer & Man, and puts in evidence copies of the pages above named, the same being marked Edison's Exhibit No. 11.

988 Counsel for Sawyer & Man objects to the exhibit as an incomplete copy of the record referred to, and as impertinent, the copy being no evidence unless the record itself is put in.

32 Q. Have you read the printed record of the testimony of Messrs. Sawyer & Man in this interference?

A. The larger portion of it.

33 Q. Where a paper-carbon conductor built up in the manner described by Sawyer & Man in their testimony is used in an electric lamp, what special function as regards incandescence is exerted by the paper-carbon portion of such conductor?

A. As a mechanical support for holding the solutions with which the carbon is built up.

34 Q. Would not materials other than paper carbon serve for such a support?

A. Yes; asbestos, for instance, in the cases where they dip the loop into solutions; or fiber of any description.

35 Q. I wish you would examine the answer of William E. Sawyer to the 18th question, and the statement about candle power, duration of burners, fracture, &c., and state what results would follow from the various conditions named in his answer.

A. I should judge from the surface of the lamp in Sawyer's Exhibit No. 4, and from the thickness of the carbon, that it might be possible for a lamp to last, giving twenty-five candles, for the time mentioned. The surface, I should think, is twice as great as that in Exhibit Edison's Commercial Incandescent Electric Lamp. Since the economy of a lamp is inversely as the surface, it would take more power to obtain the same light from the Sawyer, as from the Edison. At the same time the thickness of the carbon is so great that it should also last much longer than the Edison carbon. The resistance of the carbon shown in the drawing must be in the neighborhood of 1 ohm at the most. This, in my opinion, renders the lamp totally uncommercial owing to the enormous loss there must be from conduction through the clamps. For example, the Edison carbon having 100 ohms and the clamp 1 ohm, only $\frac{1}{101}$ of 989 all the energy used by the lamp will be lost in the clamp, while in the lamp, Sawyer's Exhibit No. 4, if the clamp has a resistance of 1 ohm, the same as in the Edison, one-half of the total energy used in the lamp will be lost in the clamps. Besides this, the increase of the size of the carbon allows more heat to be conducted from it to the clamps. As a result, I should judge it would be impossible to seal the lamp unless some device were used to dissipate this heat, making the lamp very large and clumsy.

36 Q. Referring now to the description and sketches given in the printed record of Sawyer & Man's testimony, of the perfected lamp made by them, state whether in your opinion such a lamp would be a practical lamp, and give your reasons?

A. I do not think that it is a practical lamp. The first objection is on account of its low resistance, as stated in the previous answer. Besides the heat at the clamps, owing to the large currents that would have to be employed to give out sufficient energy for light from a small resistance, there would be a great deal of trouble in making the clamp last, as the tendency for arcs to spring between the clamp and the carbon would be so greatly increased.

I do not consider it possible to make such a lamp and hermetically seal it in a glass case, preventing any air from reaching it. Unless this is done, a carbon lamp blackens the globe that surrounds it very quickly. Judging from my experience with nitrogen placed in the globe around a lamp, it would be extremely difficult for a carbon to give the same light continuously for a number of hours. I tried for over a week at one time to make a carbon, composed of paper only, burn in an atmosphere of nitrogen, without success.

I took every precaution that Mr. Edison and his chemist, Dr. Moses, suggested to make the nitrogen pure. The experiment was carried on in the bell jar of an air pump. The air was exhausted from the bell jar, and nitrogen drawn in. Then again exhausted, and nitrogen again drawn in. I made the nitrogen, holding it in large bags, then, before drawing it in, the bell jar was dried
990 and passed over hot copper filings. With loops made of paper only, no light could be made. I should also say, that the lamp, Sawyer's Exhibit No. 4, if filled with nitrogen would soon lose it, if lighted many times. When lighted, the gas inside the globe will be expanded, thrusting out the nitrogen. When cold, the outside air will be drawn in to replace the nitrogen. Judging from the style of the lamp, I should say that the gas would be very much compressed when the lamp was lighted, owing to the great amount of heat evolved in a small chamber.

Counsel for Edison gives notice that he here closes his examination of this witness, and offers him to counsel for Sawyer & Man for cross-examination.

Cross-examination by Amos Broadnax, counsel for Sawyer & Man:

37 X Q. What is your name?

A. Francis R. Upton.

38 X Q. Have you fixed the exact date, by reference to your accounts, when you went into the employ of Mr. Edison?

A. November 15, 1878.

39 X Q. Have you been continually in his employ from that time to this?

A. Yes, to the first of January, 1881, when I became superintendent at the lamp factory of which he is chief owner.

40 X Q. Where is the lamp factory of which he is the chief owner; and what kind of lamps are manufactured there?

A. The factory is situated at Menlo Park; and the lamps are those suitable for his system of electric lighting.

41 X Q. Are the lamps that are manufactured at that factory substantially like the lamp Exhibit Edison's Commercial Incandescent Electric Lamp?

A. Yes, with the exception that bamboo is used in a large 991 number on account of the ease of manipulating it, instead of paper, for the illuminating conductor.

42 X Q. Which makes the best carbon for electric lighting by incandescence, paper or bamboo?

A. Bamboo.

43 X Q. How is bamboo superior to paper for that purpose?

A. On account of the difficulty of procuring paper of even thickness, and because the fibres of bamboo are continuous in the direction in which the current flows.

44 X Q. How does the resistance of an illuminating conductor made of bamboo compare with the resistance of a similar conductor made of paper?

A. The resistance of the bamboo is slightly less than that of paper.

45 X Q. Is the difference in the resistance of the two carbons sufficient to affect the practical working of the lamp?

A. No.

46 X Q. Then, for all practical purposes, in this respect they are the same?

A. Yes, in so far as their illuminating properties are concerned.

47 X Q. What proportion of the lamps manufactured by you are fitted with illuminating conductors made of carbonized paper?

A. One to two per cent., I should judge.

48 X Q. In preparing your carbons for electric lamps, do you treat them electrically in the presence of hydrocarbon gas?

A. No.

49 X Q. What training have you had as an electrician?

A. A college course of electricity, the handling of electrical apparatus in the physical laboratory at Princeton, and one year's work at electrical measurements of various kinds at Berlin before entering Mr. Edison's employ; since I have been with Mr. Edison I have made calculations concerning electrical matters, 992 and assisted in a large number of electrical experiments.

50 X Q. Do you consider yourself an expert in the practical application of electricity in electric lighting?

A. So far as relates to the incandescent electric light, I do.

51 X Q. Before you went in the employ of Mr. Edison, were you acquainted with him?

A. I had met him once in a visit to his laboratory.

52 X Q. In answer to question 5 you say when you went into the employ of Mr. Edison he was experimenting with the platinum spiral lamp with a thermal regulator, and was making an extended series of experiments to find the laws of magnetism, and was also studying publications relating to constructions of dynamo machines. How long did Mr. Edison continue on those experiments, and in studying publications referring to constructions of dynamo machines?

A. Up to the present time, I should say; of course, with intermissions, giving time for his experiments to be carried out.

53 X Q. Does Mr. Edison still continue in his experiments upon the platinum spiral lamps with thermal regulators?

A. Yes; through his assistants.

54 X Q. I read your answer to question 6 of your examination-in-chief (counsel reads): Please to state when it was that he tested the thread of carbon made in his telephone experiments for the purpose of ascertaining its resistance, referred to in the answer I read?

A. My impression is that it was in August or September, 1879; that is the best of my recollection.

55 X Q. In answer to that question you say: "I recollect when one of the first successful loops was made; Francis Jehl and I measured the resistance, cold, of the carbon." State, as nearly as you can recollect, when it was that you and Francis Jehl measured the resistance of the paper-carbon loop, referred to in that answer?

993 A. To the best of my recollection, in November, 1879.

56 X Q. You say, in answer to the same question, that your attention was more particularly drawn to the vacuum pumps, and to the construction of dynamo machines. State, if you please, when it was that you succeeded in getting a pump by which you could obtain a satisfactory vacuum in the illuminating chamber of your lamps?

A. To the best of my recollection, in July, 1879.

57 X Q. In answer to that same question, you also say: "I remember that we all felt very much elated at the fact of the carbon not changing its resistance, for it showed that there was no wasting away of the carbon; we then felt that it was possible to make a system of electric lighting simply by adding to the life of the lamp, which we have since done." State, if you please, in what way you have since added to the life of the lamp?

A. First, by making better clamps for the carbon, so as to hold the carbon firmly, and prevent arcing. Secondly, by making better carbons. Third, by improved methods of getting the vacuum, so as to be sure that all the lamps are well exhausted, even when the workman is not expert.

58 X Q. In answer to question 11 you say the first recollection you have of Mr. Edison turning his attention to improved means for producing a vacuum in electric lamps was when he sent you to Princeton to borrow a Geissler pump. Have you been able to fix the date exactly when that was?

A. I have not. I looked last night but could find no record by which I could fix the date exactly.

59 X Q. Was it after you went to Princeton to borrow the pump, that you came to New York to advertise for a glass-blower for Mr. Edison, as stated in answer to question 12?

A. I did not advertise; but it was after that that Mr. Edison advertised for a competent glass-blower.

60 X Q. State, if you recollect in what paper it was that that advertisement was inserted?

994 A. My impression is, the "Herald."

61 X Q. Give the date as near as you can recollect?

A. It was in the summer of 1879. I can't fix the date.

62 X Q. How often did Mr. Edison advertise for glass-blowers;

and state whether all the advertisements were subsequent to the time that you borrowed the pump at Princeton?

A. My impression is twice. All the advertisements were subsequent.

63 X Q. This lamp referred to by you as being at the corner of Mr. Thornall's barn, as burning from fourteen to one thousand five hundred hours—what was the luminosity of that lamp in candle power?

A. I should judge from twelve to sixteen candles.

64 X Q. How long would such a lamp last, in your judgment, yielding a luminosity of twenty-five candle power?

A. From four hundred to six hundred hours.

65 X Q. What, in your judgment, would be the average life of the lamps referred to in the record, about which you have been testifying, yielding a luminosity of twenty-five candle power?

A. As the lamps were then made, when not very good, they would arc at high candle power, excepting these, I should say from 100 to 200 hours.

66 X Q. Do you mean to be understood as saying, if the plan of the lamp was skillfully carried out in its construction and organization, it would endure from one to two hundred hours at a luminosity of twenty-five candle power—referring of course to the lamps noted in the record?

A. I do.

66½ X Q. Have you ever tried any of your lamps like Exhibit Edison's Commercial Incandescent Electric Lamp, raised to a luminosity of twenty-five candle power?

A. We never have at that point. We have tried above and below, and my judgment is as stated.

995 67 X Q. At what luminosity have you tested the candle power of the lamp referred to in my last question?

A. At forty-eight candles.

68 X Q. How long did the carbon endure at a luminosity of forty-eight candle power?

A. My impression is somewhere in the neighborhood of fifteen hours.

69 X Q. What size was the carbon?

A. Substantially the same as that in the Exhibit Edison's Commercial Incandescent Lamp.

70 X Q. In answer to question 27 you say that you wrote the article contained in "Scribner's Monthly" for February, 1880, marked Edison Exhibit No. 10; are the statements of facts contained in that article true, of your own knowledge?

A. So far as I was able to verify them they were.

71 X Q. At the head of that article I find the following statement: "Editor 'Scribner's Monthly,' dear sir, I have read the paper by Mr. Francis Upton, and it is the first correct and authoritative account of my invention of the electric light. Yours truly, Thomas A. Edison, Menlo Park, N. J." Was that written by Mr. Edison?

A. It was, at the suggestion of the editors of "Scribner's Monthly."

The fac-simile of the letter as written by Mr. Edison is published in the fore part of this book.

72 X Q. Did Mr Edison revise this article before it was published?

A. He revised portions of it.

73 X Q. Did he read the whole of it before it was published?

A. I cannot say. I think he did not read the historical part.

74 X Q. Which one of the patents granted to Sawyer & Man is "for a stick of carbon rendered incandescent in nitrogen"?

A. In answer to the question I refer to the patent 205,144.

996 75 X Q. Now, please to point out the claim in that patent that is "for a stick of carbon rendered incandescent in nitrogen"?

A. Claim 16 is the one that I referred to more especially, which reads: "In the sealed globe of an electric lamp which contains an azotic or other atmosphere, an absorbent of carbonic acid gas," together with the following in the body of the specification, "To charge our lamp we prefer to employ nitrogen gas, and this we produce in the lamp by our improved process in a state of great purity."

76 X Q. Now, after reading the claim and the extract from the specification, don't you think your statement in your magazine article is too broad?

A. Not in a mere brief summary of the history of electric lighting, as is purported to be given in the article.

77 X Q. Do you swear that the statement in the magazine article of the Sawyer & Man patent is an accurate statement of the facts as they appear in the patent?

A. The patent itself is the best evidence of what it contains. If what I stated is right it can be verified from the patent.

FRANCIS R. UPTON.

Mr. KRUESI recalled:

39 Q. I asked you in questions 5, "What is the earliest date which you remember of Mr. Edison's experimenting with electric lights?" To which you answered, "I am not sure whether it was the summer of '77 or summer of '78." Please state whether you have made such examination of memorandum books since giving the above answer, as will enable you to fix the time more definitely.

Objected to on the ground that it is a re-examination of the witness on a point about which he had already been examined.

997 JOHN KRUESI, a witness produced in behalf of Mr. Edison, testifies on oath as follows, in answer to questions proposed by GEORGE W. DYER, counsel for Edison:

40 Q. Have you been previously examined in this case?

A. Yes.

41 Q. Since your former examination have you found a memorandum book which enables you to fix with certainty dates about which you were uncertain when you testified before?

Question objected to upon the ground that it is intended to call out matter and facts about which the witness has been already examined.

A. Yes, sir.

42 Q. Refreshing your memory by such memorandum book, what is the earliest date you are able to fix in which Mr. Edison was engaged in experimenting upon electric lights?

Objected to as immaterial.

A. January the 5th, 1877.

43 Q. If you have such memorandum book, please produce it and describe what the book is?

Objected to as immaterial and impertinent.

A. I do produce the book. The book is a memorandum book in which I put the time down for which I requested pay, showing how the time, or in what the time was occupied.

44 Q. Is this book in your own handwriting?

A. Yes, sir.

45 Q. Were the entries made at the time marked in the book?

A. They were always made never later than the next following Saturday, and generally every day; sometimes even three or four times in one day.

998 46. Q. Please read from the book the items which bear upon experiments in electric lights by Mr. Edison, giving the dates which appear in the book?

Objected to as incompetent to prove the contents of the book, unless the book is put in evidence.

A. "January 5th, 1877, electric lamp, 3 hours," "January 6th, 1877, electric lamp, 4 hours." "1877, January 20, air pump, 8 hours."

47 Q. For what purpose was the work done on this air pump under date of January 20th?

A. To my best recollection for an electric-light purpose.

Memorandum book referred to put in evidence and marked Edison's Exhibit No. 12.

Exhibit objected to as incompetent evidence upon any issue in the cause.

Counsel for Edison gives notice that — here concludes his examination of this witness and offers him to counsel for Sawyer & Man for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

48 X Q. Is this book in your handwriting, the whole of it?

A. Yes; I don't see anything that isn't my own handwriting.

49 X Q. In whose employ were you when you made this memorandum book?

A. In Mr. Thomas A. Edison's.

50 X Q. And does this book show the time that you was at work on different kinds of work for Mr. Edison?

A. Yes, sir.

51 X Q. Where was you working from June the 13th, 1876, to January 2d, 1877?

A. I was working for Mr. Edison in Newark, N. J.

999 52 X Q. Are all the entries in this book made in lead pencil?

A. All except a few entries in the last four leaves of the book, and three entries in October, 1875.

53 X Q. Referring now to the entries in this book made on the page beginning with January 2d, 1877—do you swear that the entries on that page are all in your own handwriting, and that they were made by you on the day of the date set down in the left-hand column of the page?

A. Yes, I am positive that they are all in my own handwriting, and that they are put down not later than the next following Saturday to these respective dates, or on the same day that they are dated.

54 X Q. Does the column of figures on this page headed particular jobs represent the number of hours you were employed each day upon the job mentioned in the middle columns, in which the name of the job is given?

A. Yes, sir.

55 X Q. Does this represent your own time, and not the time of somebody else?

A. It is only my own time.

56 X Q. By this book it appears that January 5th you worked three hours on electric lamps. What kind of electric lamp was you working on, and what was you doing to it during those three hours?

A. I do not remember the lamp, nor exactly what I did to it.

57 X Q. Is the same true as to the work it appears that you done on electric lamp on January 6th—4 hours?

A. Yes, sir.

58 X Q. Is this your book?

A. Yes, sir.

59 X Q. Your own private property?

A. Yes, sir.

60 X Q. Has it been in your possession ever since it was made?

A. It has been in my possession ever since I made the entries.

1000 61 X Q. Why didn't you refer to this book and produce it when you was previously examined in this case?

A. I was called to this examination from my place of business in the city of New York, and the book I kept in my house at Menlo Park, New Jersey. Therefore I did not have it at hand.

62 X Q. Have you got any more books bearing upon this subject?

A. Yes, sir. I have some more, but to my knowledge they do not bear upon this subject.

63 X Q. How does it happen that there are no entries in this book from June 13, '76, to January 2d, '77?

A. The entries may be in another book, on account of the dissolving of partnership between Mr. Edison and Mr. Murray at that time.

JOHN KRUESI.

STEPHEN D. FIELD, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows, in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.,

A. Stephen Dudley Field; 35 years old; residence, New York; occupation, electrical engineer.

2 Q. Please state whether or not you visited Mr. Edison at Menlo Park, in 1877, and if so, at what time during that year.

A. I visited Mr. Edison's place during the summer of 1877. To the best of my recollection it was the middle or latter part of the month of August.

3 Q. When at Menlo Park, at the time named, did you see Mr. Edison perform any experiments in incandescent electric lighting, and if so, please state what the experiments were?

1001 Question objected to as going to prove that the invention was made before the date alleged in the preliminary statement of Mr. Edison, and notice of motion to strike it out at the hearing.

A. I went there at Mr. Edison's invitation to witness experiments in incandescent lighting. The experiment consisted in the heating, by means of a bichromate battery, of small crystals, of what Mr. Edison called silicon, said crystals being supported between carbon clamps.

4 Q. Please examine exhibits marked Edison's Exhibits No. 4 and No. 13, already in testimony in this case, and state whether or not these exhibits indicate substantially the character of the experiments which you then witnessed.

Objected to as immaterial and incompetent. Notice of motion to strike out.

A. The experiments which I witnessed are indicated in figures 1 and 2 of Exhibit 4, and the middle and lower figures of Exhibit No. 13. The exception being that the source of power in the experiments was a bichromate battery in place of magneto machines, as shown in the exhibit.

5 Q. During that visit to Mr. Edison, did he explain to you what he had previously done in incandescent electric lighting, and if so, what explanation or information did he give?

Same objection and same notice.

A. My recollection is that he stated that this use of silicon he hoped would give him an inoxidizable agent for a burner, and thereby greatly simplify the problem of incandescent lighting.

Beyond that I have no recollection of any conversation between us, except he referred to a note book which he showed me, wherein he had first discovered the incandescent properties of silicon.

1002 6 Q. Do you recollect whether or not Mr. Edison spoke of materials for incandescent conductors, which had been previously tried by him and found to be oxidizable?

Same objection and same notice.

A. My recollection is that we had a general conversation on the subject, the details of which have, however, almost entirely escaped my memory.

7 Q. Who was present during these experiments you have mentioned, besides yourself and Mr. Edison?

Same objection.

A. Dr. Cornelius Herz, now in Paris, and Mr. Batchelor, I believe, and one or two of Mr. Edison's assistants.

Counsel for Edison gives notice that he here closes his examination of this witness, and offers him for cross-examination.

No cross-examination.

STEPHEN D. FIELD.

THOMAS B. STILLMAN, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows, in answer to questions proposed by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation?

A. Thomas B. Stillman; 29 years old; residence, Plainfield, N. J.; occupation, analytical chemist and assayer.

2 Q. Please state whether or not you are acquainted with William E. Sawyer, the electrician.

A. I am.

1003 3 Q. Please examine the paper I now show you, marked Edison's Exhibit No. 8, and state whether or not you read the same soon after its publication in the newspapers?

Objected to as immaterial.

A. I have examined the paper shown me; I read it; it might have been one month, but not later than three months after its publication.

4 Q. Did you ever hear William E. Sawyer speak of the authorship of that article, marked Edison's Exhibit No. 8?

Same objection.

A. I have.

5 Q. How often have you heard him so speak?

A. Once, certainly; and I think twice.

6 Q. Repeat what he said as nearly as you can remember it.

Objected to as incompetent and immaterial.

A. I can't state what he said; he called my attention to the article, and asked me if I had read it. I said "No." I then read it.

7 Q. How did he speak of it—as his article?

Objected to as leading.

A. I can't say that he did. My impression is he said "my challenge."

8 Q. Do you remember what he said when he asked you to read the article?

A. I don't recollect any more than what I have said, positively.

9 Q. Have you heard the article referred to in his presence as his article?

Objected to as incompetent.

A. Not in those words as coming from him, but the impression derived from what he said led me to think he wrote the article.

1004 10 Q. Have you heard the article referred to in his presence, as his challenge, or as Sawyer's challenge to Edison?

Objected to as incompetent.

A. Not by other parties, but when Mr. Sawyer drew my attention to it as his challenge.

11 Q. Are you acquainted with Mr. William E. Sawyer's signature?

A. Yes, sir.

12 Q. Please examine the paper now shown you, state whether or not the signature, W. E. Sawyer, is in the handwriting of William E. Sawyer?

Objected to as incompetent.

A. I think it is—yes, sir.

13 Q. Have you any papers in your possession in the handwriting of William E. Sawyer, containing his signature?

Objected to as incompetent and immaterial.

A. I have.

14 Q. Please produce the same?

Same objection.

A. I produce a note sent to me by William E. Sawyer.

The paper first mentioned is put in evidence and is marked Edison's Exhibit No. 23.

Exhibit 23 objected to as not being shown to be in the handwriting of Mr. Sawyer, or caused to have been written by him, and as not being produced by the person to whom it is addressed; and as incompetent, irrelevant and immaterial.

Second paper referred to, being a note to the witness, is put in evidence and marked Edison's Exhibit No. 24.

1005 Objected to as incompetent, irrelevant and immaterial.

15 Q. Please state if you find the newspaper article put in evidence, and marked Edison's Exhibit No. 23, published in the New York "Sun" of January 5, 1880?

Objected to as incompetent, irrelevant and immaterial; and upon the further ground that there is no proof that the paper put in evidence was January 5, 1880.

A. I find it published in the paper dated on that date—January 5, 1880.

16 Q. Also is the paper now shown you, the same extract cut out of the newspaper?

A. Yes.

Extract referred to put in evidence and marked Edison's Exhibit No. 25.

Objected to as incompetent and no proof of anything except its own existence.

17 Q. Were you subpœnaed as a witness in this case for Mr. Edison?

A. I was.

Counsel for Edison here closes his examination of this witness and offers him for cross-examination.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer & Man:

1 X Q. When was this paper marked Exhibit 24 written?

A. I can't give the date of it.

2 X Q. How do you know this paper is in the handwriting of Mr. Sawyer?

A. It is the same handwriting I have always seen him use.

1006 3 X Q. How often have you seen him write, if at all?

A. A number of times; I can't state exactly how many.

4 X Q. About how many?

A. I couldn't state about how many; I have been connected with him nearly three years.

5 X Q. Can you swear that you saw Mr. Sawyer write ten times in these three years?

A. Yes, sir.

6 X Q. And use the same handwriting every time?

A. Yes, sir; with one exception—when he couldn't see.

7 X Q. Did you see him write when he couldn't see?

A. I did not. He had injured his eyes by an explosion. I had a note written from him when his eyes were in that condition, where he stated that fact. That note was in a different handwriting.

8 X Q. In whose handwriting is this paper—Edison Exhibit 23?

A. I don't know; it looks like Sawyer's uncle's—Leonard Sawyer.

9 X Q. Did you see Mr. Sawyer sign this paper?

A. No, sir.

10 X Q. It's not in the handwriting of Mr. Sawyer, is it?

A. No, sir.

11 X Q. Do you know whether Mr. Sawyer read it or heard it read after it was written?

A. I do not.

12 X Q. Do you know whether he dictated it?

A. I do not.

13 X Q. Is this the paper Mr. Sawyer referred to as his challenge to Mr. Edison?

A. No, sir; the paper he referred to as his challenge to Mr. Edison is Edison's Exhibit No. 8.

14 X Q. Do you know who wrote this paper—Exhibit No. 8?

A. No, sir.

THOS. B. STILLMAN.

1007 WILLIAM SAWYER, a witness produced in behalf of Mr. Edison, being duly sworn, testified as follows, in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence, and occupation.

A. Name, William Sawyer; age, 59; present location, Earle's hotel; occupation, gentleman, as near as I can act one.

2 Q. Are you the father of William E. Sawyer, the electrician?

A. Yes.

3 Q. Please examine the paper now shown you which is marked Edison's Exhibit No. 8, and state whether you read the same soon after the date of its publication.

Objected to as incompetent, irrelevant, and immaterial.

A. I think I read that, about the time of its publication. I couldn't swear positively that this is the same thing, but think it is virtually the same. It was a challenge.

4 Q. Did you ever hear your son, William E. Sawyer, deny being the author of this challenge?

A. No, sir; nor I never heard him acknowledge it.

Latter part of the answer objected to by counsel for Edison as not responsive.

5 Q. Have you not stated within a week that your son, William E. Sawyer, wrote this challenge before referred to?

Objected to as incompetent.

A. I may have made that remark. I couldn't say that I did not. I have no recollection of making that remark, neither will I say that this is the challenge, shown me, that he wrote.

1008 6 Q. Have not you stated within a week that you went into a certain place and found your son dictating this challenge to a messenger boy?

Objected to as also being incompetent.

A. Emphatically, no. I may have stated that I understood that he did dictate to a messenger boy, and the messenger boy wrote it down as it came from his lips, but not from my personal knowledge. It was hearsay.

7 Q. From whom did you understand that William E. Sawyer dictated that challenge to a messenger boy?

A. I couldn't tell; not within my recollection.

8 Q. Did you ever hear this challenge talked over in the presence of William E. Sawyer?

A. No, sir; to the best of my recollection, I never heard the subject-matter talked over in his presence, either with myself or any other parties.

9 Q. Have you not stated within a week that you advised your son William E. Sawyer that he ought not to have published the challenge referred to, or so advised him at the time the challenge was being dictated?

Objected to as leading and immaterial.

A. I do not recollect of doing so.

10 Q. At what place did you understand this challenge, so called, was dictated?

A. According to the best of my recollection he was boarding at 200 West Forty-second street, at the time of this publication.

11 Q. I do not ask where he was boarding, but where, as you understand it, he was when this challenge was dictated?

Question objected to as calling for hearsay evidence, and upon the further ground that the witness has not stated that he understood the challenge to be dictated at all.

1009 A. I have answered this question before. He may, however, have been boarding at 267 instead of 200 West Forty-second street. My present impression is that it was dictated either at 200 or 267 West Forty-second street. I would not state positively to either place, as I have no means of fixing it.

12 Q. Have you not stated within a week that that challenge was dictated at the corner of Walker and Elm streets?

Objected to as grossly leading and immaterial.

A. I have no recollection of it.

13 Q. Have you any recollection of talking with any one whatever about this challenge within a week?

A. I have no recollection of it.

14 Q. You stated conversationally, a moment ago, did you not, that you were very much annoyed when you read this challenge in the newspapers?

Objected to as leading and immaterial.

A. I did so state confidentially to Mr. Dyer.

15 Q. Had you any doubt at the time of reading this challenge that it proceeded from your son, William E. Sawyer?

Objected to as leading and immaterial, as to what his opinion was, or doubts upon the subject.

A. Of course, I took it for granted, as all others would, the communication being over his signature.

16 Q. Were you subpœnaed as a witness in this interference?

A. Yes.

Counsel for Edison closes his examination of this witness, and turns him over for cross-examination.

1010 Cross-examination by AMOS BROADNAX, Esq., counsel for Sawyer and Man:

17 X Q. Do you know of your own knowledge, whether your son, William E. Sawyer, wrote or dictated this article, cut from a newspaper, and marked Edison's Exhibit No. 8?

A. No.

WM. SAWYER.

JAMES A. RUSSELL, a witness produced in behalf of Mr. Edison, being duly sworn, testifies as follows in answer to questions proposed to him by GEORGE W. DYER, counsel for Edison:

1 Q. Please state your name, age, residence and occupation.

A. Residence 347 West Thirty-sixth street, New York; I am a canvasser for the Edison Electric Light Company; my name is James A. Russell, and I am 44 years of age.

2 Q. State whether or not you know Mr. William Sawyer, who has just testified as a witness in this case and in this room?

Objected to as immaterial.

A. Yes; I know him.

3 Q. State whether or not you have heard Mr. William Sawyer lately make any statements regarding the authorship of a newspaper challenge published in the New York "Sun," December 22d, 1879, marked Edison's Exhibit No. 8, and if so, when and where were such statements made, and what was the statement?

Objected to as calling for mere hearsay testimony, at second or third hand, and after the witness, William Sawyer, has testified that he really didn't know anything about it.

1011 A. On Sunday last at Earle's hotel, talking with Mr. Potter. Mr. Potter had a conversation with him about a man named William Sharpe, who had formerly been in the employ of William E. Sawyer. Mr. Potter said he would like to hire him as he was an expert mechanic. He said he wanted to hire him for a gentleman friend of his in Reading, Pennsylvania. This man wanted him to do some very fine work. That was his object in calling on Mr. Sawyer.

Mr. Sawyer said: "Do you know how that article was written?" He said: "Ed. was drunk, and it was written by a District telegraph boy at his dictation, and he told Ed. he had made a mistake," and Ed. says, "I've done it, I've done it. They can't answer it." I don't know that he said he was drunk, but that he was a little off.

4 Q. What article was referred to in the last part of your answer?

A. The challenge, Edison's Exhibit No. 8. I want to add to my last answer that Mr. Sawyer said, "Ed. slings a nasty pen, and talks too much."

Counsel for Edison closes his examination of this witness and offers him for cross-examination.

Cross-examination by Amos Broadnax, Esq., counsel for Sawyer and Man:

5 X Q. At the time you overheard this conversation which you have related in your examination-in-chief, did Mr. Potter show Mr. Sawyer this exhibit?

A. No.

6 X Q. How did he identify the article?

A. He mentioned the fact that the article was written in the "Sun" just before Christmas.

7 X Q. Did he say that he saw his son dictate the article?

A. Yes.

8 X Q. How did you come to go there?

1012 A. I went to H. Dralle, 93 Walker street, and he told me that William Sawyer, Sr., could give me all the information.

9 X Q. What did you want of Mr. Sharpe?

A. I wanted some excuse to have an interview with Mr. Sawyer.

10 X Q. And the object of your interview, as I understand you, was to see what you could suck out of him about this matter.

A. Not to suck out of him, but to obtain anything I could that would benefit my employers.

JAMES A. RUSSELL.

James D. Potter, a witness, produced in behalf of Mr. Edison, testifies as follows, in answer to questions proposed to him by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence and occupation?

A. James D. Potter; age 57; residence, 390 Manhattan avenue, Brooklyn; I am engaged in mining.

2 Q. Are you acquainted with William Sawyer, who has just testified in this case and in this room?

A. I am acquainted with the gentleman who calls himself William Sawyer. I have just come in this building and did not see Mr. Sawyer here.

3 Q. Have you had a conversation with William Sawyer lately about the authorship of an article called a challenge, published in the New York "Sun," December 22d, 1879, marked Edison's Exhibit No. 8, and if so, when and where did you have this conversation, and if anybody was present besides yourself and Mr. Sawyer, state who was present?

Question objected to as calling for mere hearsay testimony, as contradicting the statement made by one of Mr. Edison's own witnesses.

A. It was on Sunday, July 17th, at 2 o'clock, at Earle's hotel; Mr. James A. Russell was present.

1013 4 Q. Please state what Mr. Sawyer said in regard to the authorship of the article referred to in the former question?

A. We had a conversation in regard to a man named William Sharpe, desiring to know his locality, as I wished to hire him for a gentleman in Reading. He informed me where Sharpe could be found; said he was at Ansonia, Connecticut, employed by the Wallace Manufacturing Company. Then the conversation drifted off to electricity. He said, "Ed. was one of the best electricians in the United States." I told him I had read many articles of his son's about electricity, electric light, etc. He said, "Did you read that challenge in December, '79?" I said, "Yes, sir;" and also said "that never was answered." He replied, "He couldn't answer it." He then said, "Do you know how that was written—under what circumstances?" I said, "No, I do not." He said, "I'll tell you. Ed. got a telegraph boy to write it." He said "he was pretty full," or "he was drunk;" one or both expressions. "While he was dictating it he would fall asleep or dose off. He would wake up and ask, 'Where did I leave off? What did I say last?' The boy wrote the article, and that was the way he wrote it. He was writing the article when Sawyer came in. He said to him, 'Ed., do you think you're doing right?' He said, 'Yes, I've done it, I've done it. They can't answer it.'"

Examination ended. No cross-examination,

JAMES D. POTTER.

James E. O'Keeffe, a witness, produced in behalf of Mr. Edison, testifies as follows in answer to questions proposed by George W. Dyer, counsel for Edison:

1 Q. Please state your name, age, residence and occupation?

1014 A. James E. O'Keeffe of 65 Monroe street, New York; office boy to the Aldine Publishing Company; age, 15.

2 Q. What were you doing before you went in the office of the Aldine Publishing Company?

A. Working in E. Daly's boat shop.

3 Q. Where before that?

A. With Matthew, Leach & Co.'s wholesale and retail tea store.

4 Q. Were you ever in the employ of the American District Telegraph Company. If so, when and where?

A. In the 15th district, from May, 1879, until February, 1880.

5 Q. Look at this newspaper article I show you which is marked Edison's Exhibit No. 8, and state what you know, if anything about that article?

A. I remember hearing him speak about a challenge, and there was words in it that I couldn't spell and he told me how to spell them—big words.

6 Q. Did you write that article from anybody's dictation?

A. Yes, sir.

7 Q. When was it; and where was it?

A. In Dralle's lager-beer saloon, corner of Elm and Walker streets, in December, 1879, on Sunday morning.

8 Q. What did you do with the article after you wrote it from dictation?

A. I handed it back to Mr. Sawyer.

9 Q. Then what did you do with it?

A. He put it in an envelope, and I went up to the Sun office.

10 Q. Did you leave the paper at the Sun office?

A. Yes, sir; and I brought back an answer.

Counsel for Edison closes his examination-in-chief of this witness, and gives him over for cross-examination.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

11 X Q. Was the article you wrote from Mr. Sawyer's dictation printed in the "Sun"?

1015 A. I don't know; I didn't see it.

12 X Q. Can you produce the paper that you wrote from Mr. Sawyer's dictation?

A. No, sir.

13 X Q. When did you read that paper—Edison's Exhibit 8?

A. To-day.

14 X Q. Is that the first you read it since you wrote it from Mr. Sawyer's dictation?

A. Yes, sir.

15 X Q. Now, can you swear that this paper, Exhibit 8, is a copy of the paper that Mr. Sawyer dictated to you, as you have stated?

A. I can't say that it's all, but I know some of it is.

16 X Q. After the paper was printed, did you compare the printed paper with the paper you say you wrote from Mr. Sawyer's dictation?

A. No, sir.

17 X Q. Have you ever seen the paper that you wrote from Mr. Sawyer's dictation, and that you took to the Sun office, since you took it to the Sun office?

A. No, sir.

18 X Q. What was the answer that you brought back from the Sun office?

A. I don't know; Mr. Sawyer didn't receive the answer, but the man behind the bar. Mr. Sawyer was upstairs.

19 X Q. Was Mr. Sawyer drunk when he dictated the paper to you?

A. He acted like it.

Redirect examination by Mr. GEORGE W. DYER, counsel for Edison:

20 Q. Have you ever written any other paper from dictation for anybody else?

A. Yes, sir; once before; for a man down in New street.

JAMES E. O'KEEFFE.

1016 Present: Amos Broadnax, counsel for Sawyer & Man, and Geo. W. Dyer, counsel for Edison.

Francis R. Upton, a witness produced on behalf of Edison, being duly sworn, testifies as follows in answer to questions proposed by George W. Dyer, counsel for Edison:

1 Q. You have already testified in this case, haven't you?

A. Yes.

2 Q. Do you know Alexander Welsh, who has testified in this case as a witness for Sawyer & Man?

A. Yes.

3 Q. When did you first become acquainted with him?

A I first met him in the fall of 1880.

4 Q. Under what circumstances?

A. He was employed in the lamp factory, and I came in contact with him in my visits to that place; the Edison lamp factory at Menlo Park was referred to.

5 Q. How long did Welsh work at the lamp factory at Menlo Park?

A. Until about February, 1882.

6 Q. What was his employment when he first worked at the lamp factory?

A. My impression is he was employed in exhausting the lamps.

7 Q. Do you know how long it was after that he began to work at carbonizing?

A. He commenced carbonizing about February, 1881.

8 Q. Did he commence then to learn the business of carbonizing?

1017 A. He had some slight acquaintance of the methods used from seeing the process carried on. When he commenced at this time, he was instructed specially in this branch and gave his whole time to it.

9 Q. Were his instructions confined to Mr. Edison's methods of carbonizing?

A. As far as I know, they were.

10 Q. Was there any time he was given full charge or the carbonizing, and if so, about what time was that?

A. From the time he was employed in carbonizing until he was discharged, he was given full charge of the carbonizing.

11 Q. Do you remember the time when he was thus employed in the carbonizing?

A. From February, 1881, till February, 1882, is my recollection.

12 Q. Why was Alexander Welsh discharged?

A. Because we had lost confidence in him.

13 Q. For what reason?

A. When he was placed in charge of the carbonizing it was expressly mentioned that he should report experiments truthfully. We were satisfied he was not doing so; this lack of truthfulness had become a by-word in our factory.

14 Q. Since he was discharged what has been his attitude towards

the Edison Electric Light Company, and the interests of Mr. Edison?

A. Most of the time active opposition.

15 Q. What instances, if any, can you give of active opposition?

A. It has come to my knowledge several times that he was employed in trying to get workmen in the Edison interests, away to other companies.

16 Q. Mr. Welsh in his testimony says that you made promises which you failed to fulfill, which led in consequence to a very bad feeling between us; this was an answer to X Q 105. Have you anything to say in regard to this statement of Mr. Welsh?

A. I have absolutely no recollection of any unfilled promises to
Mr. Welsh. I had no bad feeling towards him, except that
1018 I had been provoked by finding out how grossly he had
abused the opportunities that were given him.

17 Q. Mr. Welsh says in his redirect testimony, in answer to questions 116 and 117, that he has since been solicited to return to the employ of Mr. Edison by yourself. Have you anything to say as to that?

A. After his discharge from the lamp factory I was desirous of preventing him from carrying information gained by him, at the employ of the lamp factory to opposition companies. I recommended him to the superintendent of the Isolated Company, as a bright man, at the same time cautioning him regarding his habit of untruthfulness.

18 Q. Do you know Robert White, a witness who has testified in this case in behalf of Sawyer and Man?

A. I do.

19 Q. Did he work at the lamp factory at Menlo Park, and, if so, in what capacity?

A. He worked there as fireman in carbonizing.

20 Q. About what time did he leave the lamp factory and under what circumstances?

A. He was discharged at the same time as Welsh.

21 Q. Why was he discharged?

A. Because we did not think it prudent to discharge Welsh and leave his intimate friend behind.

22 Q. Mr. Welsh testifies that he made certain exhibits of paper carbon on a morning in July, 1881, between about 7:15 and a quarter to 8, and that it was necessary to complete them at that hour because the train left at eight (8) for New York, and Robert White testifies that you were present during a portion of the time when such exhibits were being made. What recollection have you as to the facts thus testified about?

A. I have no distinct recollection of being present at the time mentioned. I am very positive that there was no train at eight for New York.

24 Q. What hour nearest that time did the train run?
1019 A. At 7.30, within a very few minutes; the next train
after was 9.20.

24 Q. Robert White testifies that in that carbonization you threw

water upon the carbonizing box to hasten the cooling of it. What do you say to that statement?

A. I do not recollect doing anything of the kind.

25 Q. He testifies further that you then carried away the specimens of carbonized paper for the purposes, Mr. Welsh informed him, of giving them to Mr. Chas. Batchelor at the depot. What have you to say to that statement?

A. I can't recollect so doing.

26 Q. Do you remember the fact that at the time Mr. Batchelor testified in this case, in July, 1881, he produced specimens of carbonized paper purporting to have been made in the manner described by Mr. Man and Mr. Sawyer in their previous testimony in this case?

A. I have been informed that he did so.

27 Q. Have you any knowledge or information who made those exhibits produced by Mr. Batchelor, and where they were made, and during what time of the day?

A. I have always understood that he (Mr. Batchelor) made them himself, assisted by Mr. Atcheson, the night before he testified regarding them, and that they were made in the laboratory at Menlo Park.

28 Q. Was the laboratory a distinct building from the lamp factory, and, if so, about what distance from it?

A. It was entirely distinct and separated from the lamp factory by a distance of about 1,500 feet. The lamp factory was at the foot of the hill, the laboratory on top. Men employed in one were not allowed in the other, except on business.

29 Q. Were you present during the time when Mr. Alexander Welsh gave his evidence in this case?

A. I was most of the time.

30 Q. Were you present when Alexander Welsh produced and
put in evidence samples of carbonized paper purporting to
1020 have been made in accordance with descriptions in the former testimony of Mr. Man and Mr. Sawyer?

A. I was.

31 Q. Did you examine such specimens at the time sufficiently to form an opinion upon them?

A. I did.

32 Q. What opinion did you then form of them, as adapted to practical use, in incandescent electric lamps?

A. I formed a very decided opinion that for practical use in incandescent electric lamps they would prove an utter failure. First, in manufacturing lamps the breakage in clamping such loops would be so great as to preclude their use in competition with materials now ordinarily used. Secondly, owing to the irregularity of the carbon they, if it were possible to bring them to incandescence, would be so irregular as to shorten their life very materially. Third, owing to their extreme lack of elasticity it would be almost impossible to transport lamps if such could be made.

33 Q. In the first reason given in the previous answer what would cause the breakage in clamping referred to in that answer?

A. In clamping carbons it is necessary to handle them and to hold them firmly. From my experience I should judge there would be great liability of breakage in either of these operations. The cause of it would be the friable nature of the carbon. I scarcely dared touch the exhibits for fear of breaking them.

FRANCIS R. UPTON.

1021 Same counsel being present, and PHILIP S. DYER being duly sworn, is produced as a witness in behalf of Thomas A. Edison, and answers to the questions propounded to him as follows:

1 Q. Please give your name, age, residence and occupation.

A. Name, Philip S. Dyer; age, 26; residence, East Newark, N. J.; employed as book-keeper for the Edison lamp factory.

2 Q. How long have you been in the employ of the Edison lamp factory as book-keeper?

A. Since January 1st, 1881.

3 Q. Do you know Alexander Welsh, who has testified as a witness in this case in behalf of Sawyer and Man?

A. Yes.

4 Q. Was he at any time in the employ of the Edison Lamp Company at Menlo Park?

A. Yes, sir.

5 Q. When did he enter such employ?

A. About October 1st, 1880.

6 Q. When did he take charge of carbonizing?

A. About the latter part of January, 1881.

7 Q. When did he leave the employ of the Edison Lamp Company?

A. Latter part of January, 1882; discharged.

8 Q. Why was he discharged, if you know?

A. Considered untrustworthy and unreliable.

9 Q. Do you know what his reputation for veracity was among the employees of the company?

A. Very bad.

10 Q. Do you know Robert White, who testified as a witness in this case for Sawyer and Man?

A. I do.

11 Q. Do you know when he was employed by the Edison Lamp Company at Menlo Park?

A. Yes, sir.

1022 12 Q. What date was it?

A. Middle of April, 1881.

13 Q. When did he leave the employ of the Edison Lamp Company, and why?

A. In the latter part of January, 1882; discharged because he was considered unreliable and a friend of Alexander Welsh.

14 Q. What do you know about Mr. Alexander Welsh having attempted to entice away men from the Edison Lamp Company after he had been discharged by them?

A. I know of a conversation he had with one man and know of a telegram he sent to another man, and that man told me Welsh was trying to get him.

Answer objected to as mere hearsay.

Cross-examination by AMOS BROADNAX, counsel for Sawyer and Man:

15 X Q. What was in the telegram?

A. Welsh wanted this man to meet him in Brooklyn on a certain night.

16 X Q. What was the man's name?

A. Robert McKune.

17 X Q. When was that?

A. I think in the fall of 1882.

18 X Q. What time in the fall of 1882 was it?

A. I can't say definitely.

19 X Q. Please to repeat the words of the telegram.

A. As near as I can remember, "Meet me in Brooklyn this evening;" I can't remember where the place was.

20 X Q. And you inferred from the language of that telegram that Mr. Welsh was trying to induce the man McKune to leave the employ of the Edison Lamp Company, as I understand it?

A. I inferred that from the telegram after what McKune told me that Welsh had been trying to get him to go over there previous to that time.

1023 21 X Q. What did McKune tell you; please to repeat his words as near as you can.

A. That Welsh had sent word to him several times to meet him.

22 X Q. To meet him for what purpose?

A. Relative to taking a position in the company that Welsh was with.

23 X Q. Did McKune meet him?

A. Not to my knowledge.

24 X Q. How did McKune come to make this statement to you that Welsh was trying to get him to leave the employ of the Edison Lamp Co.?

A. On account of my giving him the telegram, and friendly relations between us, he being about my age. All the telegrams came to my office by telephone.

25 X Q. What was Mr. Kune's duties in the Edison lamp factory?

A. Cutting bamboo fibres for use in the Edison lamp.

26 X Q. Can't you fix the time a little more definitely when you received this telegram from Mr. McKune?

A. No, sir.

27 X Q. Did you ever know Mr. Welsh to tell a falsehood?

A. Yes, sir.

28 X Q. What did he lie about?

A. Everything.

29 X Q. Lied all the time?

A. Yes, sir; pretty near all the time.

30 X Q. Can you mention something he lied about?

A. Yes, sir.

31 X Q. Please do so.

A. He lied to me one time about owning a horse. He lied to me several times about his accounts.

32 X Q. Did he swear to these lies, any of them?

A. No, sir.

33 X Q. How do you fix the dates of the time that Mr. Welsh went in the employ of the Edison Lamp Company, and the time that he left the employ of that company?

1024 A. From records now in the hands of the Edison Lamp Company.

34 X Q. Do you refer to the time books of the Edison Lamp Co.?

A. Yes, sir.

35 X Q. Who kept those books at the time you say Mr. Welsh went in the employ of that company?

A. The assistant in the office at Menlo Park, John Randolph.

36 X Q. Did you examine that book before you came here to give testimony yourself?

A. I examined that book first when I went in the employ of the Edison Lamp Company in 1881.

37 X Q. When did you last examine it upon this question of fixing time when Mr. Welsh went in the employ of the Edison Lamp Company, and when he left that employ?

A. I examined the book last which contains the memorandum of his entering the employ of the Edison Lamp Company last week not with any idea of testifying here.

38 X Q. How large is that book?

A. Larger than a sheet of legal-cap paper.

39 X Q. How thick and how much larger?

A. The cover of the book is 9 x 14 and 1$\frac{3}{4}$ inches thick.

40 X Q. If you can do so, please to produce the book?

A. I do produce the book.

41 X Q. Please to take this book and read from it all the entries you can find in it respecting the time credited to Alexander Welsh?

A. I do so. (Witness reads from page 166.)

Alexander Welsh.

1025 32 X Q. Is that all you find in the book that goes to show the time when Mr. Welsh entered the employ of the Edison Lamp Company and when he left it?

A. That is all I find in that book to show when he entered the Edison Lamp Company's employ.

43 X Q. How does that account show that Mr. Welsh did not enter the employ of the Edison Lamp Company before October 1st, 1880?

A. The first entry of his name and the first account that we had with him and the first knowledge of a man by the name of Alexander Welsh.

44 X Q. Was this book kept by the Edison Lamp Company or by Thomas A. Edison?

A. Strictly speaking, it was kept by the employees of T. A. Edison, but the Edison Lamp Company paid for the man's services keeping the account.

45 X Q. Do you know of your own knowledge that Alexander Welsh was not in the employ of Thomas A. Edison or the Edison Lamp Company previous to October 1st, 1880?

A. No, sir.

46 X Q. Is your statement that Alexander Welsh went in the employ of the Edison Lamp Company first on October 1st, 1880, based upon the entry in this book you have already quoted?

A. Not wholly.

47 X Q. What other fact or circumstance is your statement to that fact based upon?

A. Conversations with Welsh and other employees of the Edison Lamp Company.

48 X Q. Please to repeat what conversation you may have had with Mr. Welsh upon that subject.

A. Conversation was general. It was a curiosity to know what time Welsh went to work for the Edison Lamp Company.

49 X Q. Can you swear to anything that Mr. Welsh said that enables you to fix that date?

A. A conversation that I remember having one time with Welsh about the rights of the older employees of the lamp company.
1026 Welsh only being there a few months previous to my going there, our rights were about equal.

50 X Q. Is that all?

A. Yes; I remember Welsh saying that he was there about three or four months before I. I also remember Mr. Holzer, the superintendent, saying so, and others.

Redirect examination by Geo. W. Dyer:

51 Re-D Q. This book that you testified about—what is written on the outside of the book?

A. "Time book."

52 Re-D. Q. What is printed on the back of the book?

A. "T. A. Edison."

53 Re-D. Q. After you went into the employ of the Edison Lamp Company, were regular books first started for that company?

A. Yes, sir.

54 Re-D. Q. By whom and under whose directions?

A. By Mr. Wm. Carman, under the directions, I suppose of Mr. Edison. Mr. Carman started the books, and then I kept them afterwards.

55 Re-D. Q. Was this account of Mr. Welsh that you have quoted transferred to the company's books?

A. It was.

56 Re-D. Q. And charged against the Edison Lamp Company?

A. Yes, sir.

57 Re-D. Q. Was that the earliest account in which Mr. Alexander Welsh's name appears on the books of the Edison Lamp Company?

A. Yes, sir.

58 Re-D. Q. Do you know how the morning trains from Menlo Park to New York ran in July, 1881?

A. Yes, sir.

50 Re-D. Q. What were the hours?

A. 6.55 first; 7.21, 9.21 and 11.21.

1027 Recross-examination by Mr. BROADNAX:

60 Re-X Q. What is printed on the side of this book about which you have testified?

A. "Platina."

PHILIP S. DYER.

U. S. Circuit Court, Western District of Pennsylvania.

THE CONSOLIDATED ELECTRIC LIGHT COMPANY
vs.
MCKEESPORT LIGHT COMPANY.
} In Equity.

NEW YORK, *April 25th*, 1889.

Testimony taken on behalf of defendant before William T. Farnham, special examiner herein, pursuant to the 67th rule of the U. S. Supreme Court in equity as amended.

Attended at office of Amos Broadnax, 120 Broadway, New York. Present: Mr. Donnelly for defendant, and Mr. Broadnax for complainant.

CALVIN GODDARD, a witness called on behalf of the *plaintiff* and duly sworn, testified as follows:

By Mr. DONNELLY:

1 Q. What is your residence and occupation?

A. 205 West Fifty-seventh street; my occupation—well, it is various.

2 Q. Well, generally?

A. Say general manager.

1028 3 Q. Do you remember the circumstance of going either alone or with any gentlemen for the purpose of seeing the

Sawyer-Man electric lamp? And if so state when such visit was and who accompanied you.

A. I don't think I can fix the date definitely. I have no memorandum, but I recollect distinctly going to a workshop or laboratory which was occupied by Mr. Sawyer to see an incandescent light, and with me were Mr. Lowery, at whose invitation I went, Mr. Galloway, Mr. Edward N. Dickerson; I think Mr. J. Hood Wright accompanied us. I am not clear about that, but that is my impression, and possibly some one else. I don't remember distinctly as to others.

4 Q. Do you remember the year and the time in the year it was when you made that visit?

A. No, that I cannot fix. My impression would be that it was some time in 1878, for it was early in the history of the Edison Company.

5 Q. And what time in the year was it?

A. I couldn't say.

6 Q. You don't remember whether it was in the fall?

A. I have no means of fixing the season of the year. I think it was later than the summer. It may have been in the fall or winter, because I was absent during the summer.

7 Q. Do you remember where this place was located which you visited?

A. No, I don't know the exact locality. It was on one of the cross-streets I should think out of Broadway, below Canal street, and in the neighborhood of Centre street in this city. I don't remember the exact address.

8 Q. Did you see an electric lamp at this place?

A. Yes, my recollection is very distinct as to what I saw.

9 Q. State what you saw in that respect?

A. I saw a glass tube—straight tube—inclosing conductors, with a piece of carbon held between the two conductors, which, under the current, was made incandescent.

1029 10 Q. What was the shape of this carbon?

A. It was a straight piece of carbon.

11 Q. A straight carbon pencil was it?

A. It was a slight, slender piece of straight carbon.

12 Q. Did you see any other lamp at that place at that time?

A. None other.

13 Q. Did you see any other form or shape of carbon than the straight pencil?

A. Nothing else than that.

14 Q. Did Mr. Sawyer in your presence or in your hearing refer to any other carbon?

A. No.

15 Q. That is, either arch-shaped or any other form than the straight carbon?

A. I have no recollection of any conversation with regard to anything else than what I saw.

16 Q. Was anything said by Mr. Sawyer in your presence or

hearing with reference to fibrous material or carbonizing fibrous material?

A. No; I recollect no description of the process by which the carbon was manufactured. I simply saw what I saw without any description of its method of production.

17 Q. Were you with the other members of the party who visited this place during the conversation at the interview with Mr. Sawyer?

A. Yes; the conversation was general.

18 Q. And all in your presence, was it?

A. As to that I cannot remember distinctly. It is possible that something may have been said which I did not hear. My best recollection is that the conversation was general, and that we were all together.

19 Q. Did you see more than one single lamp?

A. I saw various forms. I recollect now that one lamp that had a piece of carbon parallel with the sides of the tube, and in other cases it was at right angles with the sides of the tubes. These two forms I recollect.

20 Q. You saw several lamps, then?

A. Yes; several lamps—quite a number.

1030 21 Q. But these pieces of carbon were in all instances straight?

A. Yes, sir.

22 Q. Of what size were they?

A. They were quite short; I should think half an inch, perhaps.

23 Q. How thick were they; what diameter?

A. That would be difficult for me to say. They were quite small; perhaps as large as—no; I don't think I can give any illustration of its size. They were small, but not exceedingly slender.

24 Q. You can give us some idea.

A. I don't think of anything to compare it to that would fix it.

25 Q. Of course, we understand it is a mere estimate that you make of the diameter.

A. It might possibly have been a sixteenth of an inch.

26 Q. Was anything said by Mr. Sawyer in your presence or in the presence of the gentlemen who accompanied you—Mr. Lowery and the others—in reference to carbonizing fibre or carbonizing paper or any other material?

A. Nothing of that sort was spoken of in my hearing.

27 Q. Well, if it had been, do you think that you would have remembered it?

A. I certainly should.

28 Q. Please look at Complainant's Exhibit — which I now show you, and state whether the lamp designated "Sawyer-Man electric lamp," shown in said exhibit correctly shows and illustrates the lamp you saw on the occasion of your visit to the shop of Mr. Sawyer, as you have stated.

A. That is as I recollect it.

29 Q. Did you see any other kind of a lamp there except the one shown in said exhibit?

A. My impression is I saw one where the strip of carbon ran between the two conductors, across the tube.

30 Q. That is horizontally?

A. Yes; at right angles to the sides of the tubes.

1031 31 Q. Did it differ from the other in any other respect?

A. Not materially in other respects.

Cross-examination by Mr. Broadnax:

32 X Q. Did you have any conversation personally with Mr Sawyer at the time of your visit there?

A. Not that I recollect, except with all the others.

33 X Q. A sort of a general conversation?

A. Yes, sir. Undoubtedly I asked some questions. If I did it was in the presence of the rest.

C. GODDA*D*D.

Sworn and subscribed before me.

WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

R. M. Galloway, being called on behalf of defendant and duly sworn, testifies as follows:

Direct examination by Mr. Donnelly:

1 Q. Give your residence and occupation?

A. I live at No. 68 East Fifty-fifth street, in the city of New York, and my occupation is that of vice-president of the Manhattan Elevated railroad, No. 71 Broadway.

2 Q. Do you remember any occasion when, in company with Mr. Lowery, Mr. Goddard and others, you visited the shop of Mr. Sawyer for the purpose of inspecting an electric lamp?

A. I visited a shop. I don't know whether it was Mr. Sawyer's or whose shop it was. I remember going with this gentleman, with Mr. Dickerson, Mr. Lowery, Mr. Hood Wright, and this gentleman, Mr. Goddard. We had a dinner, I think, beforehand, and went from there to this place.

1032 3 Q. Do you remember the time and the place?

A. I don't remember the place.

4 Q. It was in New York?

A. It was in New York city.

5 Q. Do you remember the year, whether it was about 1878, or about that?

A. It was about that time. I don't remember the exact time.

6 Q. You visited the shop. Did you see an electric lamp there?

A. Yes; there were electric lamps there.

7 Q. How many did you see?

A. I don't remember.

8 Q. Several?

A. I presume there were.

9 Q. Did you inspect them with a view of ascertaining anything

about their construction—the construction of the lamps you saw at that time?

A. I presume I did at that time, for I was interested at that time in knowing what they were.

10 Q. Do you remember the shape or form of the carbon in the lamp, whether it was straight or arched?

A. I do not; I couldn't say what it was.

11 Q. Do you think if you were to see a cut of the lamp you would be able to recall its form of construction?

A. I might try.

12 Q. Please look at the cut which I now show you, Complainant's Exhibit — and which is design-ed "Sawyer-Man electric lamp," and state whether the lamp therein shown and illustrated is substantially like the lamp which you saw on the occasion of this visit with Mr. Lowery?

A. I don't recognize it at all.

13 Q. You don't recall the construction of it?

A. I do not.

14 Q. Do you recognize the carbon?

A. No, sir; I do not.

15 Q. You don't know what kind of carbons you saw?

1033 A. I do not. I have no recollection of it. I simply remember going to see that light as I went to see at different times many others.

16 Q. Do you remember Mr. Sawyer making any statement in regard to carbonizing material, or fibrous material, or anything of that kind?

A. I don't remember hearing any statement made. We were all there to examine a light, and what that light was, or what statements were made in connection — it, I cannot now remember.

R. M. GALLOWAY.

Sworn and subscribed before me.

WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

GROSVENOR P. LOWERY, a witness called on behalf of the defendant and duly sworn, testifies as follows:

Direct examination by Mr. DONNELLY:

1 Q. Please state your residence and occupation.

A. I reside in the city of New York, at 121 Madison avenue, and am a lawyer by profession.

2 Q. Do you remember visiting the shop of William E. Sawyer about the year 1878, and if so, please state when it was and the circumstances attending that visit, as you now recall them?

A. I remember making such a visit, and I remember being accompanied by Mr. E. N. Dickerson and J. Hood Wright. I don't remember Mr. Goddard and Mr. Galloway being there, but have no doubt whatever that it is so. I do not remember the date, but know that it was March 28th, 1879, by a letter written on my behalf and signed by a young gentleman in my office, which is Complainant's

Exhibit "Rockwell-Kent Letter." As to the place, I don't remember it except that it was a shop on the second or some higher 1034 floor of a building somewhere near Canal street, I should think in Centre street, but I do not doubt that it was at 94 Walker street as stated. The shop or premises consisted of about two or three rooms, one of which seemed to be an office, another a kind of workshop, and the third an engine-room. I went there by some invitation, I don't remember whose, but have no doubt it was at the invitation of Mr. William Church from the evidence which Complainant's Exhibit "Rockwell-Kent Letter" gives me. I saw Mr. William E. Sawyer there. The visit was some time in the evening while we were all on our way uptown to our residences. It occurred, I think, at 8 or half past 8 o'clock in the evening. Mr. Sawyer received me and those who came with me, and exhibited to us certainly two or three, and perhaps five or six incandescent electric lamps. I think they were not all burning at one time, because Mr. Sawyer called our attention especially to the fact that he could burn one or more at the same time, and I remember that the lamps were turned on and off. My impression is that they were never all burning at once. I have examined the endorsement on the back of Complainant's Exhibit "Rockwell-Kent Letter," which is stated by Mr. Broadnax to be in the handwriting of Mr. Sawyer, beginning with the phrase, "Friday night they all came."

3 Q. On the occasion of this visit you said you saw several lamps. Please state fully the form of the carbons which you observed in such lamps, as to their being straight or otherwise.

A. They were all straight; I saw nothing in any other form.

4 Q. Was anything said at that time in your presence, or in the presence of these gentlemen who accompanied you, as to carbons of arch shape or horseshoe shape, or being formed or composed of fibrous material?

A. Nothing was said in my hearing in respect to either the shape of the carbons or of the material of which it was composed. The business of the visit, I might say, on the part of Mr. Sawyer was confined entirely to three subjects: One to show that he had a 1035 lamp which gave a light; second, that he could turn on and off these lamps; third, there was reference made in my hearing to some process by which he treated carbons in olive oil, and I have some recollection that Mr. Dickerson went into the adjoining room to see that. I did not go, being at the time entirely uninformed in respect to carbons for lamps. I did not know but this was the way in which all carbons were treated. It did not excite any interest or attention in my mind.

5 Q. Was anything said at that time about carbonization, or modes of carbonization of paper or any other material?

A. Nothing was said about the way in which the carbons were produced except as might be inferred from what I have stated above, that they were treated in olive oil.

6 Q. What was the size of these carbons which you saw in the lamps; that is, their diameter and length?

A. About that my recollection is not very definite, at least concerning the length. I should say they were exceedingly short—stumps; certainly not more than half an inch; so short that when illuminated the effect upon the eye to me was something like a ball of fire. As to their thickness, I have a more clear recollection. I should say that they were an eighth of an inch thick, as large as a large lead in a lead pencil.

7 Q. Please look at Complainant's Exhibit — and particularly at the Sawyer-Man electric lamp therein shown and illustrated, and state whether it correctly shows and illustrates the lamp which you saw on the occasion of your visit, as you have stated?

A. I had seen the cut now shown me in the "Scientific American" of December 7th, 1878, previous to this visit and expected to see a lamp giving the general impression of this cut. This cut represents a finish and grandeur and fineness quite different to that which the actual lamp produced. It appeared to me a rather shabby original for so fine a picture. The parts all seem to me to be larger here than they really were in that other lamp. The incandescent portion seems to me to be longer. There were one or two lamps
also whose incandescing parts were perpendicular to the
1036 plane of the sides of the lamp. That is, across the top connecting the two conductors across the top.

8 Q. Were the parts in the lamps which you saw similar to the parts represented in the cut?

A. Yes, sir. There were very heavy metallic conductors inside the glass tube or lamp chamber.

9 Q. And the carbons in some of the lamps were arranged perpendicularly as shown in that cut?

A. Yes, and some horizontally.

10 Q. On the occasion of this visit, was anything said by Mr. Sawyer in your presence, or in the presence of these gentlemen, in reference to paper carbons, the carbons for the lamps being made of paper or of fibrous material of any kind?

A. Nothing was said in my hearing as to what his carbons were composed of at all. Certainly he never mentioned the word "paper" nor the word "fiber" in my hearing.

11 Q. Did he state to you that he had made any investigation or experiments in that direction?

A. Nothing was said about that in my hearing. He told me that the incandescent part was that carbon. My limited knowledge of carbon was such—in fact it was not anything. Probably my idea of carbon was something black. Where it came from I had not the remotest idea. I know that he did not speak of paper or fiber, because within a few months after that, while the matter was fresh in my memory, I for the first time heard—after the production by Mr. Edison of the first one hundred lamps in December, 1879, that some one claimed that there was something special about using paper or fiber for carbon, and also something special about having it in a horseshoe or curved form.

12 Q. That was long after this visit?

A. It was several months after this visit, but while the matter was still fresh in my memory, and what I remember now is that at

that time I knew that I had not seen any curved-form conductor anywhere except at Edison's laboratory, and I had never heard paper or fiber spoken of as material for a lamp conductor until
1037 about the time Mr. Edison brought out his one hundred paper lamps.

13 Q. After looking at this letter, is your recollection refreshed as to the time and place of this visit?

A. Not at all; but I have no doubt the date of the letter is correct.

Cross-examination by Mr. Broadnax:

14 X Q. Do you undertake to recollect or to know all that Mr. Sawyer said at the time of the visit referred to?

A. No, not at all. He said very little to me. His conversation was addressed to a group of gentlemen, who walked about his shop with him, and to whom he pointed out things. I don't remember that we separated at all at any time, except a general impression that Mr. Dickerson went to look at the olive oil work. I think I can remember whether he did or did not say any particular thing to me that would be suggested; but I do not pretend that my memory will, upon a call like that, bring up everything.

15 X Q. Did you examine the carbons when they were not illuminated?

A. No; I was never nearer to one of the carbons than as one would stand looking at a light burning; at least I don't think so.

16 X Q. State as to the length of time you were at Mr. Sawyer's place of business examining these lamps that you have described.

A. I should be surprised if it were more than from half to three-quarters of an hour; 40 minutes perhaps, and a considerable portion of that time was consumed in the engine-room with Mr. Dickerson, who gave particular attention to the engine—and I think a dynamo machine was there. The question of special interest at that time to Mr. Dickerson and myself being, not whether the light could be obtained by the incandescence of something through which a current of electricity passed, but what expenditure of energy it would cost to get that light and maintain it, a question
1038 entirely of economy; and I think at least a third of the time we were there was spent either in the engine-room or talking about the engine, and I don't think the entire time would exceed three-quarters of an hour.

G. P. LOWREY.

Sworn and subscribed before me.

WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

James Hood Wright, a witness called on behalf of defendant, and duly sworn, testifies as follows:

Direct examination by Mr. Donnelly:

1 Q. What is your residence and occupation?

A. Banker; 23 Wall street, New York.

2 Q. Do you remember on or about March, 1879, visiting any place in New York city in company with Mr. Lowery, Mr. Dickerson, Mr. Goddard and other gentlemen for the purpose of seeing an electric lamp at Mr. Sawyer's place of business; if so, state what you remember about it?

A. I spent one evening in company with Mr. Dickerson, Mr. Lowery, Mr. Goddard, Mr. Galloway, at a place in Walker street. Mr. Sawyer exhibited to us a lamp. I have no means of fixing the date. I don't recollect it.

3 Q. Did you examine or look at this lamp in company with these other gentlemen?

A. Yes, sir.

4 Q. Do you remember what the form of the carbon was, as to whether it was straight or otherwise—the pencil?

A. My recollection is that it was a small straight pencil.

5 Q. What was the length of the pencil and its diameter cross-section?

A. About an inch or an inch and a half in length and
1039 about the thickness of a lead pencil; quite as thick as that;
a little thicker I should say; it might have been a sixteenth
of an inch.

6 Q. How many lamps did you see on that occasion?

A. I do not remember.

7 Q. More than one?

A. Two or three.

8 Q. Were they all alike in construction as to the carbon pencil?

A. My recollection is they were.

9 Q. Was anything said on that occasion in your presence or in your hearing in reference to arch-shaped carbons or carbons made from fibrous material?

A. Nothing whatever.

10 Q. Was anything said in your presence on that occasion about carbonizing fibrous material?

A. No, sir.

11 Q. Was anything said to you about paper carbons—that the carbons in the lamps were made of carbonized paper?

A. No such statement made to me.

12 Q. Look at the cut of a Sawyer-Man electric lamp which I now show you, being Complainant's Exhibit —, and state whether the cut of the lamp therein shown is a correct representation of the lamp which you saw on the occasion of your visit to Mr. Sawyer's place of business.

A. In general form I should say that was similar to the one that I saw.

13 Q. Were you all there together with Mr. Sawyer during the time of your visit, or did you separate?

A. We were sitting in a room together watching the thing, and during the time Mr. Sawyer took me aside in a little room adjoining and I made some inquiry in regard to the nature of the carbon and his reply to me was that it was ordinary carbon dipped in oil.

That was the only remark he made to me in regard to the character of the carbon.

14 Q. Did he have any conversation with any other of the gentlemen present?

A. That I cannot answer.

1040 15 Q. You don't remember?

A. He had some discussion with Mr. Dickerson in regard to some matters that were too deep for me. They were more of a scientific character. I am not prepared to say.

16 Q. Do you remember to what those discussions related, what particular points?

A. There was a discussion in regard to the number of lamps per horse power, or number of revolutions. That was about what was said, as I remember. It was a question of how many horse power he was using and what lamps he was using.

17 Q. Are you pretty clear that there was no discussion as to fibrous material or paper carbons?

A. I heard none.

Cross-examination by Mr. BROADNAX:

18 X Q. Will you undertake to remember all that Mr. Sawyer said to you in his conversation with you?

A. I do not think our conversation amounted to a great deal more than that, except the general conversation which was addressed to everybody present.

19 X Q. Did you examine these lamps when they were not illuminated?

A. No, sir; they were all illuminated, I think, at the time.

By Mr. DONNELLY:

20 X Q. Do you remember how long you were there examining these lamps?

A. I should imagine an hour or more, or an hour to an hour and half, I should think spent in the room.

J. HOOD WRIGHT.

Sworn and subscribed before me.

WILLIAM T. FARNHAM,
Special Examiner and Notary Public.

1041 *Testimony in Reply, Taken under Order of Court of March* 18, 1889, *Reopening the Testimony.*

Testimony in reply, taken on behalf of complainant before William T. Farnham, special examiner herein, for final hearing, pursuant to the 67th rule of the U. S. Supreme Court, in equity, as amended.

NEW YORK, *March 27th*, 1889.

Attended pursuant to annexed notice. Present: Amos Broadnax, Esq., and Thomas B. Kerr, Esq., for complainant, and Grosvenor P. Lowrey, Esq., and Walter K. Griffin, Esq., for defendant, and the testimony of witnesses on behalf of complainant herein was commenced as follows:

ALBON MAN, being called on behalf of complainant and duly sworn, testifies as follows:

Q. A. What is your name, age, residence and occupation?

A. Albon Man; age, 62 years and upwards; residence, 118 Putnam avenue, Brooklyn; occupation, lawyer. I am also interested in electrical development.

Q. B. Are you the same Albon Man that testified on behalf of complainant in a certain suit in equity pending in the circuit court of the United States for the southern district of New York No. 3553, between The Consolidated Electric Light Co., complainant, and The Edison Electric Light Co. and Thomas A. Edison, defendants?

A. I am.

Q. C. How recently have you read your testimony in that case?

1042 A. Within the last week or so.

Q. D. I place in your hands a printed copy of your testimony in that case. Please to examine it, and state if you recognize it as your testimony?

A. I do; it is a printed copy of my testimony that I have read and referred to in my last answer.

Q. E. Is your testimony in that case, as there printed, a correct copy of the testimony given by you in that case?

A. It is, with certain verbal corrections, of which I have made notes, and which appear in the paper I now produce, and with the exception of some other slight typographical or clerical errors, or errors in orthography which do not change the sense or meaning (or at least the sense or meaning is apparent in the printed copy), of which I have not made note.

Q. F. Upon what page of this printed record does your testimony begin, and on what page does it terminate?

A. It commences on page 304, and ends on page 924.

Q. G. Are the several answers made by you to the questions propounded to you as printed in that book, true, and would you, if the same questions were propounded to you, again make the same answers?

A. They are true to the best of my knowledge, recollection and belief. I notice nothing therein to correct, except the errors I have before mentioned. I should make the same answers now as I made then, unless I should find myself mistaken as to any particular to which I testified in details, by subsequent light being thrown upon the subject as to which I testified.

Q. H. As you are now informed, do you find anything in the answers given by you in this testimony that you want to change, excepting, as pointed out in these notes of correction presented by you?

A. I do not.

1043 Notes of correction offered in evidence, and marked "Complainant's Exhibit Man's Correction of the Deposition as

Printed Given by Him in Case 3553," and the examiner is requested to correct the printed deposition in conformity with these notes.

Q. I. Are you willing to, and do you, as a matter of fact, adopt your deposition in case 3553 in said southern district of New York, as printed in this book, as your deposition in this case?

A. Yes, sir; with the corrections I have noted.

Counsel for complainant offers the said deposition of the witness and the exhibits referred to therein as in case No. 3553 in the southern district of New York, in evidence in this case, and the same is marked "Complainant's Exhibit Albon Man's New York Deposition, March 27, 1889."

Complainant's counsel give defendant's counsel notice that he shall now proceed to examine the witness, continuing from the end of his deposition in the New York case.

Albon Man's New York Deposition.

NEW YORK, *April* 14, 1887.

Parties met pursuant to agreement.

Appearances: Messrs. Broadnax & Bull, for complainant; Messrs. Tomlinson & Dyer, for the defendants.

ALBON MAN, a witness produced on behalf of the complainant, being duly sworn and interrogated by Mr. BROADNAX, testified as follows:

Q. 1. State your name, age, residence and occupation.

A. My name is Albon Man; my residence is 118 Putnam avenue, Brooklyn; I am a lawyer by profession, and my age is sixty years.

1044 Q. 2. Are you actually engaged in the practice of the law, or have you any other occupation?

A. I am engaged in law practice and also in electrical work.

Q. 3. What is the nature of the electrical work upon which you are engaged?

A. The manufacture of electrical motors, storage batteries, and the electric light, with the devising of plans and apparatus for the use of electricity in power and light, and for the methods of producing electrical currents cheaper.

Q. 4. How long since you first turned your attention more especially to electrical work?

A. To electrical work proper in the month of January or February, 1878. Before that time from about the year 1866, I had made electricity a special subject of study for information and pleasure, but not for work.

Q. 5. Since January or February, 1878, about how much of your time has been given to electrical work, and to what extent have you followed up the progress of the application of electricity, more especially to electric lighting and other kindred subjects?

A. During all the year 1878, and up to the spring of 1879, I was actively engaged in electrical work for electric lighting with Mr.

William E. Sawyer. From that time forward until the fall of 1882, I was not actively engaged in any electrical work; but since that time until the present I have been a director of the Consolidated Electric Light Company, and have taken an active interest in its work, but not myself participating in the doing of any work, only acting in an advisory or directing capacity. For the past two years or more I have been president of the River and Rail Electric Light Company, and have given a good share of my time to the electrical work of that company.

Q. 6. Are you the same Albon Man whose name is mentioned as
joint inventor and patentee, in the patent in suit, No.
1045 317,676, dated May 12, 1885, and also in the letters patent of
the United States 205,305, dated June 25, 1878; reissued letters patent No. 10134, dated originally June 25, 1878—the reissue being dated June 6, 1882; also letters patent No. 229,476, dated June 29, 1880; also letters patent No. 210,152, dated November 19, 1878; also letters patent 211,262, dated January 7, 1879; also letters patent 229,335, dated June 29, 1880; also letters patent 210,809, dated December 10, 1878; all of which appertain to the practical application of electricity to electric lighting and to apparatus appertaining to the production of electric lights and the regulation thereof?

A. I am. I have taken out one or two patents beside these, myself, appertaining to the same subject.

Q. 7. Referring now to the patent in suit, a copy of which I place in your hands, please to read the first claim of that patent and state when the invention or improvement covered by that claim was made.

A. In the spring of 1878, in the month of March or April.

Q. 8. Was that invention actually reduced to practice at that time?

A. It was.

Q. 9. What kind of fibrous or textile material was used by yourself and Mr. Sawyer in reducing that invention to practice?

A. At that time, March or April, 1878, principally paper and wood of different kinds, and probably jute and manilla. As to the jute and manilla my recollection is not so distinct in regard to their use in March and April, 1878, as in the months of September and October, November and December, 1878, all of them, we used paper, a great variety of woods, jute, manilla, cotton threads, broom corn, and a great variety of other substances of fibrous or textile material; and the broom corn, as I now recollect, we also used in the
spring, 1878. I think jute and manilla were also used in
1046 the spring. The paper and wood were positively used in
the spring, but I am not so certain of the jute and manilla.

Q. 10. Please to enumerate some of the different kinds of wood you used in the spring of 1878, and also the different kinds of paper used by you during the same time?

A. First, as to the woods; we carbonized a great variety of woods in the spring of 1878, among which were willow, maple, birch, elm, hickory, lignum-vitæ, poplar, and others that I do not recollect distinctly. We got all we could find. I remember one thing that we did in the spring of 1878, but I do not remember the material. We carbonized some endogenous woods, but what they were I do not recollect. We had a particular object in doing it. I do not recollect whether we used any canes, but we did use what strikes me as some of the palms; but I do not recollect what. Whether it was reeds, or cocoanut or palm woods, or what it was I do not recollect. All I know is we did it. The fibres of such woods interlace, and we had an idea that such a wood might make a stronger carbon. The fibres of endogenous woods, to some extent, interlace.

Now, as to the papers: we carbonized a great variety of them, but fell back on ordinary white blotting paper, and I should say manilla paper, and we got some good strong bond paper, linen papers—pure linen papers—and ordinary blotting paper. We used a good deal of bristol-board and a good deal of drawing paper. We had ordinary drawing paper and also cards; we cut up cards; we used a card paper; but, as I say, we fell back upon ordinary white blotting paper which was nearly pure cell*olus*e.

Q. 11. Referring now to the carbons made by you and Mr. Sawyer, of wood, in the spring of 1878, please to state how you made those carbons, and of what form you made them.

A. At first we carbonized the wood en masse and sawed and cut straight pencils of carbon out of them, and turned rings out
1047 of the charcoal on a lathe by first turning up a cylinder,
boring it to make it a tube, and cutting a ring off from the end of the tube so formed. After a few experiments of this kind, we adopted the plan of cutting the wood down substantially to the size of the carbon we desired and bent it to shape and then carbonized it. Some of the wood that we used was already in fine filaments or strings—such as excelsior, used as a packing material and for stuffiing cheap mattresses. It only required to be smoothed up, softened and bent before carbonization. Some of the wood was in the form of veneers, cut extremely thin in sheets, from which we cut out the shapes we wanted, and then smoothed them up and carbonized them. The forms were straight pencils, loops and arches.

Q. 12. As to the paper, how did you make your carbons of that?

A. At first we carbonized the paper in sheets; sometimes several sheets stuck together and pressed, from which, after carbonization, we cut out pencils and arches. After making a few carbons in this way, we cut out of the paper before carbonization various forms—straight pencils with enlarged ends, straight pencils with pointed ends, arches and loops, some of the arches having angular forms in them, some of them waving forms, some of them small crosses and stars in their length; and after cutting them into shape we placed them in boxes and crucibles in powdered carbon or plumbago, or both, in alternate layers of the carbon powder and of the papers or other substances to be carbonized, until the boxes were filled. They were then pressed down, covered up and the covers fastened down, then placed in the fire and heated until carbonized. After being carefully cooled, the boxes were opened and the carbon taken out.

The wood carbons were carbonized in the same manner.

We frequently worked the carbons down and smoothed
1048 them off after taking them from the box. We also soaked
them in sugar in some instances, and frequently when we
did so recarbonize them in a box or crucible.

I have omitted to state that the ends of paper and wood carbons in the loop and arched forms were usually enlarged where they were to be attached to the conductors, but not always. In some of the wood carbons that we made of thin veneers, I think of rosewood and mahogany, we worked the wood down into extremely thin and ten-ous sheets on a lap, or fine emery paper, cemented to a lap, and put several of the sheets together, in some instances with glue and in some instances with sugar, so that the fibre of the wood would run in different directions, and after they were dried would cut pieces for carbonization of all kinds and shapes from them.

By the word "lap," I mean a smooth, even-surfaced face plate, on which the carbons were laid and worked. In some instances we used plate glass for a lap, or face plate.

Q. 13. Please to describe a little more fully how you arranged the wood and paper for carbonization in the boxes, and describe more fully the boxes themselves?

A. We used at first iron boxes about three by four inches in size and two inches deep, with iron covers. These were mostly of heavy wrought sheet metal, with cover. Some of the first were too thin, and we burned them up. We also had one or more of cast iron, with cover. We used these boxes up, and then I got a sand crucible to do it in with cover. We at first simply wired the boxes and covers together by winding them with wire. Afterwards, we luted them with fire-clay in the angles and around the cover. We also luted on the covers of the crucibles, leaving a small orifice in each case for the escape of gases.

We began the preparation for putting the carbons in by putting a layer of powdered carbon or plumbago in the bottom of the box or crucible and pressing that down smooth and hard. We then
put in the articles to be carbonized, sometimes bending the
1049 paper or wood in the shape we wanted it, and pressing it
into the carbon edgewise. We then sifted more powdered
carbon or plumbago into the box or crucible, until the articles were covered, when we again pressed it down and smoothed it off; packed in some more articles in the same way, sifted on more carbon, pressed it down, smoothed it off; put in more articles, and so on until the box was filled, the final layer being a thick layer of powdered carbon pressed down solid, on to which the cover was pressed down.

Q. 14. What, if any other method, did you use in carbonizing these wood or paper carbons?

A. Well, by way of experiment, we filled the paper before it was cut to the size that we wanted it, with plumbago, and polished it, rubbed it down and pressed it, and then cut it to size and put it into our lamps in an atmosphere of hydrocarbon, and passed a current through it to carbonize it. We also, by way of experiment, filled the paper with sugar of lead and other mineral salts of easy reduction—I think one of them was nitrate of silver—soaking them in solutions of the salts, and after drying them and exposing them to an atmosphere of some sort, to partially reduce the mineral salts, to make them conductors we carbonized them in the same manner in the atmosphere of hydrocarbon, but these were only experiments, and we did but little of it.

The first experiment with paper was made in the open air by filling a crease in the paper with plumbago and passing the current through it. Afterwards we filled the paper with plumbago, pressed it, cut it into strips, passed the current through it and burned it up. These were our first experiments made in March, 1878. This was followed at once by the carbonization in boxes, as I have already described; that being the plan adopted in April, 1878, of making our carbons.

Q. 15. Please to give, as near as you can, the lengths and sizes of carbons made by you, as you have described?

1050 A. The carbons that we made of excelsior were as fine as those I now produce, which is a little less than the thirty-second of an inch in diameter. The broom corn was about the same size as that I now produce, or a little less. Our carbons were from that size or less up to an eighth of an inch. The different sizes varied in length, for the reason that we had not sufficient electro-motive force to force a current through the smaller carbons and heat them up to incandescence. The longest were about two inches, possibly over two inches; and the shortest were down to, I should think from recollection, a quarter of an inch. I should think somewhere about a quarter of an inch. Those we made from willow twigs were split and shaved down, the pith being taken out, and the bark off and only the wood used. With the exception of the excelsior, our wood carbons were wider than they were thick, and our paper carbons were usually wider than their thickness. They were from a sixty-fourth of an inch up to a twentieth of an inch in thickness. Possibly some of them were thinner than a sixty-fourth, where made of single sheets of paper. The excelsior which I now produce is in bad condition, and that which we used was selected, as was also the broom corn, the specimens being merely produced to give an idea as to the size and kind of material. I also produce samples of manilla fibre and of broom corn, such as we carbonized.

The specimens of excelsior, manilla, and broom corn, produced by the witness are offered in evidence, and are marked—

"Complainant's Exhibit No. 26, Excelsior, Broom Corn and Manilla, produced by Albon Man, New York, April 14, 1887."

Q. 16. What, if any, means did you take to keep the carbons in shape during their carbonization?

A. At first, we tied them in shape with very fine wire wherever they were bent. Where they were cut into shape of loops or arches, they did not require that. When they were bent in, they
1051 required fastening: sometimes they were fastened by being pressed into the powdered carbon. Subsequently, in the fall,

we got a block of carbon and bent them over that and fastened them to the block with clamps, and carbonized them in that way.

Q. 17. What use did you make of these carbons about which you have been testifying?

A. We used them in our lamps for the purpose of making the incandescent conductor of an electric light.

Q. 18. These carbons, as I understand you, you commenced to make in March, 1878, and continued it throughout the fall of the same year, and the winter of the following year.

A. We did, for the same purpose. And we used them for the purposes for which they were made.

Q. 19. What, if any treatment, did you give the carbons subsequent to their manufacture, as you have described?

A. We usually—and almost always—treated them by a process which we patented, of heating them up to high incandescence in an atmosphere of hydrocarbon liquid or gas. That was a process supplemental to the making of the carbon. We frequently, but not usually, used them in our lamps without treatment. I mean by that that a great many more of them were treated than were used without treatment. We got a better carbon by treating them, and intended to practice that method of treating them after having manufactured the carbons. We not only got better carbon, but we were able by that process to regulate its resistance, so as to make the carbon in itself uniform in resistance throughout its length, or nearly so, and at the same time to make one carbon of the same resistance as another.

Q. 20. Why did you make your carbon of various lengths and sizes as you have stated?

A. We were experimenting to ascertain which was the best carbon for us to use, with the means at our command. Where we wanted a carbon of high resistance, therefore, we made it
1052 small and long. Where of low resistance, larger or shorter, or both.

Q. 21. Is that the method usually adopted for obtaining lamps of high or low resistance, the kind of carbon remaining the same?

A. It is one of the methods. The resistance might also be varied in the same material by the carbonization being carried to a higher degree, or at a higher heat, or at a lower heat. The resistance was also varied by the extent and manner of treatment subsequent to the making of the carbon.

Q. 22. What, if any difference, is there in principle between a high-resistance carbon and a low-resistance carbon? I mean carbons of the same material. What is the difference in the making of carbons of a high or low resistance, and what is understood by a high resistance and low resistance? In other words, what is a high-resistance lamp, and what is a low-resistance lamp?

A. To the first part of the question, I would answer that carbons of uniform section and of the same character and density of carbon, vary in resistance, directly as their length. Double the length, double the resistance, other things being equal. Of the same material, the resistance is decreased as the square of the diameter is increased. This is simply an electrical principle, applicable to all substances which are conductors, and is well known to all electricians. I know of no difference in principle as to resistance peculiarly applicable to carbons.

As to the second branch of the question, it is simply to make the material to be carbonized of the proper size and length for the resistance required, and to carbonize and treat it properly. There is no fixed point where a lamp, or the incandescent portion of the lamp, in and of itself, can be said to be of high resistance or low resistance. The resistance may be made anything almost that is required from two or three hundred ohms down to a fraction of
1053 an ohm. The lamp must be made to suit the current applicable. If a current of high electro-motive force is available, then the lamp may have a high resistance corresponding to the electro-motive force. If the current available is one of low electromotive force, the resistance must be reduced until sufficient current will pass through the incandescent conductor to heat it up so as to give the required light.

It has been said that a great economy can be made by using lamps of at least one hundred ohms resistance. I do not think that any fixed resistance is yet determined upon. It is a question of the current available, the proximity of the lamp to the source of electricity, or its remoteness therefrom, and other resistances in circuit, and other circumstances, as well as of resistance. A lamp of very low resistance, even less than an ohm, might be the most economical one, in my judgment, in one position, and for a given amount of light, and with a given current; and a lamp of over 100 ohms might be the better one and most economical one, under other circumstances.

I intend to say that there is no point agreed upon among electricians at which high resistance begins and low resistance ends. The expression is purely comparative.

Q. 23. Referring now to the second claim of the patent in suit, state, if you please, when the invention, or improvement, covered by that claim, was made?

A. In March or April, 1878, at the same time the other was. It was put in practice by Mr. Sawyer and myself at that time at No. 43 Centre street, in this city. It was continued in practice all through our work, so far as I knew in regard to it, up to March or April, 1879, and, as I believe, by Mr. Sawyer from that time forward until the forming of the Consolidated Electric Light Company in the fall of 1882, and from the fall of 1882 by the Consolidated Electric Light Company until this day.

1054 Q. 24. Referring now to the third claim of the patent in suit, when was the invention, or improvement, covered by that claim, made?

A. At the same time, and in the same manner which I have already described.

Q. 25. Referring now to the fourth claim of the patent in suit, please to state when the invention or improvement, covered by that claim, was made?

A. At the same time, in March and April, 1878, and put into operation by Mr. Sawyer and myself at No. 43 Centre street, at that time; and it was continued in use from that time on down, by ourselves and our successors, and it is now in use by the Consolidated Electric Light Company.

Adjourned to Friday, April 15, 1887, at 10 a. m.

NEW YORK, *April* 15, 1887.

Parties met pursuant to adjournment.

Appearances: Messrs. Broadnax & Bull, for the complainant. Messrs. Tomlinson & Dyer, for the defendants.

ALBON MAN.

Examination continued by Mr. BROADNAX:

Q. 26. You have stated in your previous answers, that in the preparation of the paper for carbonization in some instances you saturated, or filled, and rubbed into it pulverized plumbago, and also mineral salts. Please to state definitely why you prepared the paper in that way?

A. I have explained that our first carbonization was done by a current of electricity. The paper was a non-conductor. In order to make it a conductor, so that a current could be passed through it, we filled it and covered it, as I have explained, with pulverized plumbago, simply for the purpose of making it a conductor.
1055 We used the mineral salts for the same purpose, but did not like the mineral salts, and did very little with them.

After having found that the paper filled with powdered plumbago before carbonization became a conductor, we continued in some instances, but not always, nor usually, to fill the paper with plumbago before carbonization in the boxes, in order to reduce the resistance of the loops and carbons, after they were carbonized, so that we could pass a current through them to light them up, as we had no very high electro-motive force dynamos, and no available current of a high electro-motive force.

The practice we adopted in April, 1878, was to carbonize the papers without any such treatment before putting it in the boxes and covering it with powdered carbon or powdered plumbago, as I have explained, to protect them while being carbonized. In other words, we carbonized the paper without any preparation beyond that of cutting it to the desired size or form.

Q. 27. Did you ever treat any carbon made from paper or wood with plumbago after carbonization?

A. No; we never did.

Q. 28. You have stated that it was your usual practice to treat the carbons after carbonization in the presence of hydrocarbon gas—for the purpose of bettering the carbons and equalizing their resistance. Is the process referred to by you the same as that described in your patent No. 211,262, granted January 7, 1879?

A. Yes; it is the same process described in the specification of that patent.

Q. 29. What proportion of this wood and paper carbons, made and used by you, were treated by the process referred to in the patent mentioned in my last question?

A. I could not give any definite proportion. All I can say is it was our usual practice to treat them after carbonization, but 1056 that some of them were used without such treatment. The number of untreated carbons was small in comparison with those that were treated.

Q. 30. Where is Mr. William E. Sawyer now?

A. He is dead.

Q. 31. State, as near as you can recollect, when he died.

A. I should think it was four or five years ago. I think he died in the summer of 1883. It may have been a year later that he died.

Q. 32. Do you know, and if so, please mention them, of any statements in writing to which you can refer, and by which you can fix the date certainly of the making and reducing of the invention to practice covered by the several claims of the patent in suit?

A. There was an agreement between Mr. Sawyer and myself, contained in a small memorandum book which has been mislaid, or lost. That agreement was dated February 15, 1878, and was referred to by me and quoted in my testimony in the interference between Thomas A. Edison and Sawyer and Man, about the invention of the patent in suit. Its exact words are given at page 201 of a certified copy of Sawyer and Man's supplemental proofs in that interference. The agreement was in the words and figures following:

"Advances to William E. Sawyer on account of experiments in electric lighting, made by Albon Man, and not to exceed in amount $250, and to be returned by Sawyer within fifteen months from date, in case that Man is not satisfied to go on after seeing result of preliminary experiments, for which these advances are made. Dated February 15, 1878. (Signed) W. E. Sawyer." I quote the above from the book referred to.

In addition to this agreement there followed a second agreement, dated March 19, 1878, which I now produce.

1057 The agreement is offered in evidence by complainant's counsel and marked "Complainant's Exhibit No. 27, agreement between Sawyer and Man, March 19, 1878."

The WITNESS: There was also an agreement between Mr. Sawyer and me about these same inventions, dated May 11, 1878, which I also produce.

The agreement is offered in evidence by complainant's counsel and marked "Complainant's Exhibit No. 28, agreement between Sawyer and Man, May 11, 1878."

The WITNESS: These agreements are handed to me by Mr. Broadnax, counsel to the complainant, for production in evidence here, the same having been, and still are, in his custody.

Counsel for defendants consents that typewritten copies of these agreements may be substituted for the originals and used in evidence with the same force and effect as the originals, counsel for the complainant agreeing to produce the originals in case any exigency may arise, making it necessary to do so.

Q. 33. In whose handwriting is the agreement of March 19, 1878?

A. In my own.

Q. 34. It is signed by you and Mr. Sawyer?

A. It is.

Q. 35. Mr. Sawyer signed it in your presence?

A. He did.

Q. 36. In whose handwriting is the agreement of May 11, 1878?

A. In the handwriting of William E. Sawyer.

Q. 37. And that is also signed by you and Mr. Sawyer?

A. It is. It was signed by him in my presence. That agreement of the 11th of May, 1878, it is proper to say, was prepared by Mr. Sawyer himself, and upon his own suggestion, made long be-
1058 fore the date of the agreement. He talked with me about it often, and said he would prepare such a paper, and did so, and we both signed it.

Q. 38. Do these agreements refer to, and include the invention covered by the patent in suit?

A. The first agreement of February 15th, 1878, refers to inventions of Mr. Sawyer alone, and would only cover this matter had it been the sole invention of Mr. Sawyer. The second agreement of the 19th of March, 1878, does not, in exact words or terms, refer to the invention which is the subject-matter of this suit; but prior to this, before the 19th of March, 1878, experiments had been made in the matter. At the time of the third agreement, dated May 11, 1878, the invention had been completed, and is included in that agreement, and was intended so to be.

Q. 39. The paper of May 11, 1878, mentions three joint inventions, namely: Electric lamps, regulators for electric lights and electric lighting systems, and other apparatus and inventions now under consideration. Under which of these heads was included the invention covered by the patent in suit?

A. Under both of them. At the time the paper of May 11, 1878, was made, we had already completed our electric lamp, our regulator, and our lighting system, and were considering further improvements upon them, and the carbon which makes the principal subject-matter of the patent in suit and the combinations covered by the several claims, had also been made before that agreement, and were mostly completed before the end of March, as I now recollect it; certainly before the end of April, 1878. I started in with Mr. Sawyer, with him as sole inventor; but Mr. Sawyer producing nothing practical, I commenced to work with him, and from that time we worked together in the production of these inventions. We worked together from the 6th or 7th of March, 1878, that being the date when we went to No. 43 Centre street. But the realization

that what was produced and done was a joint invention, or
1059 joint inventions, as matter of law, did not come to us until
after the execution of the agreement of March 19, 1878. It was the consideration of the subject-matter of taking out patents referred to in that agreement that brought us to consider the legal question that what was produced was, as matter of fact and law, joint invention.

Q. 40. Is it or not true that from the time that you and Mr. Sawyer started in to work upon electric lighting, at No. 43 Centre street, in the early part of March, 1878, the inventions made and patented by you and him jointly were the joint productions of both of you working together for a common end?

A. It is true that they were our joint productions, as I have already stated.

Q. 41. Can you produce any incandescent electric lamp, or part of such lamp, made in the spring of 1878, in which these carbons were used, about which you have been testifying, of filaments of paper and wood?

A. I now have and produce a glass globe of an incandescent electric lamp which I myself had made at a glass factory in the eastern district, Brooklyn, in the latter part of March, or first of April, 1878, and which I have had in my possession, first as an individual, and second as president of the Electro Dynamic Company, until the spring of 1879, when I took it into my own possession as a sample of one of our globes. It has remained in my possession ever since that time until recently, when I brought it and gave it to Mr. Broadnax, the complainant's counsel. The lamp is peculiar in having a particular size and shape, but more particularly from the fact that the flange of the lamp was made of a separate piece of glass and put on in a melted state upon the globe proper.

In the month of April or May, 1878, and before we left 43 Centre
street, we got a mould for making the flange upon the glass
1060 at the same time as the making of the globe, and ceased to
have the flange put on with a separate piece of glass.

I distinctly recollect the use of the paper, wood and other fibrous carbons in the form of lamp, the globe of which I produce. We did not have any lamp globes made after leaving 43 Centre street, in which the flange was made of a separate piece of glass fused onto the globe.

The lamp globe produced by the witness is offered in evidence by complainant's counsel, and is marked "Complainant's Exhibit No. 29, globe of lamp produced by Albon Man, April 15, 1887."

Adjourned to Saturday, April 16, 1887, at 1 o'clock p. m.

NEW YORK, *April* 16, 1887.

Appearances: Messrs. Broadnax & Bull, for the complainant. Messrs. Tomlinson & Dyer, for the defendants.

Parties met pursuant to adjournment.

ALBON MAN.

Examination continued by Mr. BROADNAX:

Q. 42. I understand from your testimony that the inventions covered by the patent in suit were made and embodied in the lamp that is referred to in the paper of May 11, 1878, as one of your joint inventions previous to the making of that paper. Am I correct in my understanding in that particular?

A. You are.

Q. 44. How long before this paper was made were the inventions of the patent in suit reduced to an operative condition as part of an incandescent electric lamp?

A. The carbons being the subject-matter of controversy in this suit, made of paper, wood and other fibrous substances, were
1061 made and put into the lamps and used, to the best of my recollection, some time in the latter part of March. It may have been the fore part of April, 1878.

Q. 45. And the lamp globe that you have produced here and put in evidence as Complainant's Exhibit No. 29, is a part of such incandescent electric lamp, as I understand you?

A. It is.

Q. 46. What kind of a bottom was used in connection with, or as part of the enclosing chamber of this lamp?

A. At first the bottoms were made of plate glass perforated to admit the passage of the conductors. This was an expensive method, and we at once got a mould for making the bottoms with perforations through them directly from the glass pots in the glass factory. And after we got that mould, which was in March, I think, 1878, we used the glass bottoms made with the moulds. They were similar to the one I now produce, but of a size adapted to the lamp Exhibit No. 29, which I have produced.

Q. 47. Can you produce any of the glass bottoms suited in size to lamp Exhibit No. 29, referred to in your last answer?

A. I do not know. I think so. I will look, and if I can find any, I will produce them. I had some.

Q. 48. State, if you know, who made this glass globe, your Exhibit No. 29.

A. I had globes like those made at two glass factories in the eastern district, Brooklyn. I cannot identify which one, nor can I give the names of the owners of the factories at present. I might find them.

Q. 49. State, if you know, whether this globe, Exhibit No. 29, was blown directly from the pot in the glass factories.

A. It was. I was present at the making of a great number of the globes. I waited at the glass factories to have them blown and made, and saw them made.

Q. 50. After you and Mr. Sawyer went to 43 Centre street,
1062 in March, 1879, did you and Mr. Sawyer make any lamps wholly of glass in which the leading-in conductors were sealed in the closing chamber of the lamp by fusing the glass upon

the conductors, and in which the glass chamber was sealed by the fusion of the glass?

A. Mr. Sawyer did have some of the bottoms fused to the globes of our lamps.

Q. 51. State, if you recollect, when Mr. Sawyer did this and how he did it.

A. In the fall of 1878, while we were at 94 Walker street, Mr. Sawyer got a glass-blower, who had his place directly opposite to ours in Walker street, to fuse some of the bottoms onto the lamps, and fuse glass tubes into the bottoms. The interiors of the lamps were set up, and the glass tubes fused in with the conductors in the glass tubes before the bottoms were fused onto the globes. The bottoms were fused onto the globes after the interior part of the lamp was set up. Mr. Sawyer also had some of our lamps blown in which there were no bottoms separate from the globe, but the conductors were led through the glass of the globes and fused in them, the works of the lamp being set up inside it, before this operation was performed.

Q. 52. As I understand you, Mr. Sawyer, in making these lamps, first made the leading-in conductors, and fixed upon them the illuminating conductor, or incandescent portion, and then after inserting these parts into the globe of the lamp, fused the glass around the leading-in wires, and then fused the tube into the globe for filling and exhausting?

A. Yes, sir; that is right. That was the way with some of them, but in some of them, he first fused the conductors through the bottom, which was a separate piece of glass, and then fused the bottom to the globe.

Q. 53. In that way, as I understand you, an all-glass lamp having its several glass parts fused together was obtained?

1063 A. Yes.

Q. 54. And the leading-in wires fused in the glass?

A. Yes.

Q. 55. How many of such lamps were made or caused to be made?

A. I do not know. Only a few.

Q. 56. Were any of them put in operation?

A. Yes, sir; some of them were in the shop at 94 Walker street.

Q. 57. State, if you know, the name of the glass-blower who made these lamps.

A. I do not know.

Q. 58. Were those lamps made in the latter part of 1878, or in the beginning of 1879?

A. They were made in the fall of 1878, before Mr. Lawrence Meyers came to the shop to stay.

Q. 59. Do you know what became of those lamps?

A. I do not; I think Mr. Sawyer took them.

Q. 60. In the manufacture of your lamps, was it your practice to grind the bottom of the lamp upon, or to the bottom of the globe of the lamp?

A. The bottom and flange of the globe were first ground accurately true upon a lap or face plate. They were then ground together until they were accurately fitted so as to be positively air-tight, and to preserve a vacuum within the lamp without anything further, without any cement, or anything of the kind.

Q. 61. Why did you prefer to make your lamps in that way rather than to fuse the bottom to the lamp?

A. We preferred to make them in that way, for the reason that we could take them down and put them up as often as we pleased, and restore the incandescent portion of the lamp, without injury to the rest of the lamp.

Q. 62. Was it common knowledge with you and Mr. Sawyer, that is, was it a thing well known to you both at the time you
1064 were making these lamps, that the bottoms of the lamps could be fused to the globe as well as ground to the bottom of the enclosing chamber?

A. We not only knew that the bottoms could be fused onto the lamps, and the conductors fused through the walls of the globe or its bottom, but we had had such experience in regard to the matter ourselves, in having the globe of the lamp itself, which was broken, mended, by putting the piece back and fusing it in by the glass-blower. Further than this, we both knew of the common use of Geissler tubes in which the conductors were led through and fused into the walls of a glass chamber in which a vacuum existed or was produced. One of the lamps referred to in my testimony in the interference case with Edison as to this patent, was broken. It was an exhibit in this case. I took it to Mr. Hahn with the piece that had been broken out of it, and he fused the piece in again, restoring the globe of the lamp. This was while we were at 43 Centre street.

Q. 63. Do you wish me to understand that the idea of making the enclosing chamber of the lamp wholly of glass, and having its several parts fused together, was a thing well known to both Mr. Sawyer and yourself, but that you preferred to make your enclosing chamber wholly of glass, having its two parts ground together, instead of fused together, for the convenience of taking the lamp apart and renewing the carbons, or any other part of it in the enclosing chamber?

A. I do; that is exactly what I mean. The fusing of glass together was old and well known, and the fusing of conductors through glass was old and well known. Sawyer and I frequently discussed the subject-matter of fusing instead of grinding and fitting the parts together.

Q. 64. Is it true, as a matter of fact, that it was well known to both you and Mr. Sawyer that it was a common thing to make glass enclosing chambers wholly of glass, having their several parts either fused or ground together, as might be considered most expedient.

1065 A. Yes, sir; it was known in this way. We, both of us, knew of the ordinary receivers of air pumps in which the vacuum is produced, and in which the bottom being of glass, the bell jar was ground and fitted to it; and our method of making the lamp was a mere matter of preference. We both knew of the fusing of the several parts of a glass vessel together, and of the fitting of them together, and we adopted as our ordinary practice the fitting of them together in preference to fusing them together for the reason I have stated.

Q. 65. Please to state exactly what your usual practice was in sealing your lamps so as to maintain a vacuum in the enclosing chamber, or an atmosphere of attenuated inert gas?

A. As I have said, we accurately fitted the parts together, so that a vacuum would be pretty well maintained, in the lamp with nothing further done. We then placed Canada balsam, the exudation from the blisters of the balsam fir tree, upon the glass, very slight in amount, and rubbed the glass parts together with the balsam between them, until they were perfectly transparent, in the same manner as achromatic telescope lenses are made. We then firmly clamped the pieces together and covered the junction with melted wax, or other substance, to exclude all air from it. We then inserted the whole base of the lamp in a cup of melted wax and allowed it to cool so as to exclude all possible air getting at the base of the lamp.

Q. 66. By this method of sealing, did you, as an actual fact, get an enclosing chamber in which you could maintain a high vacuum?

A. We did.

Q. 67. For an indefinite period of time?

A. Yes; so much so that when we took our lamps down it was difficult to separate the parts.

1066 Q. 68. In the use of your lamps, made as you have described, did you experience any difficulty in the sealing of the lamp from the heat generated by the incandescent burner?

A. We did not.

Q. 69. How long did you succeed in getting your lamps to burn continuously or periodically in 1878?

A. For hours, days and weeks; I have testified fully in regard to that matter in the interference case between ourselves and Mr. Edison about this invention, and I have nothing further to add to that testimony; it is correct to the best of my recollection, and I make my testimony on that subject in that interference my answer to your question.

Q. 70. In your last answer you have referred to an interference between yourselves and Mr. Edison. I place in your hands a certified copy of the testimony on behalf of Sawyer and Man in that case; please to take it and state between what pages of that record your testimony is to be found.

A. In the original case my testimony is to be found on pages two to twenty-five, both inclusive, and also on pages 101 to 106, both inclusive, of the same record. In the supplemental record, my testimony is to be found on pages thirty-five to sixty-three, both inclusive.

Q. 71. State whether you have recently read that testimony, and if so, whether you find it correct and true, and whether or not you desire to make any additions to or alterations of that testimony.

A. It is correct and true to the best of my recollection, except in one particular. On page twelve of the original record, in answer to cross-question 42, it appears by the record that I stated, "We moved there (meaning 43 Centre street) on the 6th or 7th of February; of that there is no doubt." The word February is either a mistake of the printer or a *lapsus lingua* of mine. It should be changed to March, so as to read, "We moved there (meaning to 43 Centre street) on the 6th or 7th of March, 1878; of that 1067 there can be no doubt." I then had in my possession a letter from Mr. Sawyer, of the same date as the day we moved to Centre street, referring to the securing of that place, and requesting me to come there, which enables me to positively fix the date. I have read the testimony recently, and I should testify to the same effect to-day, if called upon to do so, as I testified then, according to the best of my recollection.

Q. 72. Referring now to your testimony as given in the interference is that testimony, in so far as it bears upon the date of the making of the incandescent conductor of carbonized paper, applicable and pertinent to the date of the making of such conductors of other fibrous or textile material about which you have testified?

A. It is. The work was done as one whole, and at about the same time in the spring of 1878, and was continued in the fall and winter following.

Q. 73. What was the decision of the Commissioner of Patents in the interference?

A. The Commissioner awarded priority of invention to Sawyer and Man.

Q. 74. Please to produce, if you can, a certified copy of the Commissioner's decision in that interference.

A. I now do so. Copy offered in evidence and marked "Complainant's Exhibit No. 30."

Q. 75. Were you acquainted with William Sawyer, one of the witnesses who testified in the interference?

A. I was.

Q. 76. State, if you know, where he is?

A. He is dead. He was the father of William E. Sawyer.

Q. 77. And the father and son are both now dead?

A. The father and son are both now dead.

Adjourned to Monday, April 18, 1887, at 1 o'clock p. m.

1068 NEW YORK, *April* 18, 1887.

Appearances: Messrs. Broadnax & Bull, for the complainant; Messrs. Tomlinson & Dyer, for the defendants.

Parties met pursuant to adjournment.

ALBON MAN.

Examination continued by Mr. BROADNAX:

Q. 78. Referring to the invention claimed by the patent in suit, what advantage was obtained in incandescent electric lighting by such improvements?

A. By the invention of the patent in suit we obtained a pure homogen-ous carbon burner of exactly the length, form and size we wanted it, a burner that had also the necessary tenacity and density, and one in which the electrical resistance necessary to insure success could be exactly regulated; the production of an illuminating conductor for an incandescent electric lamp having these properties all united in it was a great improvement in electric lighting, as by it, it became possible, taken in connection with other improvements made by us, to make an incandescent electric lamp that was practically permanent; a lamp that cast no shadows, and in which the burner could expand and contract without injury to itself or the lamp.

An illuminating conductor having the properties I have pointed out was a new article at the time we made the invention, and it forms the essential feature of the patent in suit and makes an element in each and all the claims, and upon this element all the claims of the patent depend for their novelty; and upon a carbon burner having these properties depends the practical success of the incandescent electric lamp of to-day.

Q. 79. To what degree of perfection did you and Mr. Sawyer reduce this invention in the spring of 1878?

1069 A. We made a thoroughly operative incandescent electric lamp, having a carbon burner possessing the properties I have specified; and we made a number of such lamps in the fall of 1878 and the winter following; and we also made arrangements to have such lamps manufactured at once upon a commercial scale. The manufacture and introduction of our invention, however, was not carried out until later on by other parties, but not because the lamp as made by us in 1878 was not practical or operative. The failure to manufacture and introduce our invention at the time or immediately after it was first made was due to causes wholly outside of the invention of the lamp in which it was embodied; I do not mean that we did not afterwards make a better lamp by availing ourselves of better workmanship and by perfection of details already embodied in the lamp, but the lamp embodying these inventions which we made in the spring of 1878 was a thoroughly operative lamp.

Q. 80. I place in your hands Complainant's Exhibit No. 21, being Edison's incandescent electric lamp, and I also place in your hands the admission of complainant's counsel as to the manner in which that lamp is made. Please state whether or not, as a matter of fact, that lamp made upon the plan described in that admission embraces and includes an incandescent conductor for an electric lamp of carbonized fibrous or textile material, and of an arch or horseshoe shape.

A. It does.

Q. 81. Please to state whether or not that lamp embraces and includes the combination substantially of an electric circuit and an incandescent conductor of carbonized fibrous material included in and forming part of said circuit, and a transparent hermetically sealed chamber in which the conductor is enclosed.

A. When put into use it does.

1070 Q. 82. Please state whether or not that lamp embraces and includes an incandescent electric lamp composed of the following elements in combination: First, an illuminating chamber made wholly of glass, hermetically sealed, and out of which all carbon-consuming gases have been exhausted or driven; second, an electric circuit conductor passing through the glass walls of said chamber and hermetically sealed therein; third, an illuminating conductor in said circuit and forming part thereof within said chamber, consisting of carbon made from a fibrous or textile material, and having the form of an arch or loop.

A. I cannot know from the appearance of the lamp that the air has been exhausted from it sufficiently or completely, or that it is filled with gas inert to carbon at high incandescence. But taking the defendant's admission as the fact in regard to these things, together with the fact that it would not be an operative electric lamp unless the air were properly exhausted, or it were filled with proper gases replacing the air, and taking his admission as to the character of the carbon contained therein, I answer it does.

Q. 83. In the manufacture of the incandescent conductors for your electric lamps as you have described, did you, as a matter of fact, cut your blanks for carbons to size and shape before carbonizing them, in the year of 1878 and subsequently?

A. We did, ordinarily.

Q. 84. Why did you do that?

A. Because, first, the material before carbonization was more easily worked than afterwards. Second, we selected paper, because it was already reduced to size in one dimension, and its fibres were nearly all in one plane. We cut the wood and other vegetable material so as to have the fibres run in the direction of length of the conductor, as far as practicable, and to reject any imperfect portion of the wood or paper, and, so far as other fibrous material was concerned, to get that which would be perfect after carbonization.

1071 It was impossible to make such selection as to quality of material or disposition of the fibres if the material were carbonized in mass. Third, because by these means we were able to get a pure carbon by the use of these materials cut to shape, without flaws or cracks, with which we were troubled in endeavoring to carbonize in mass, and afterwards to reduce to size and shape; and also because the carbonization of the small incandescent conductors was more perfect and uniform where they were cut to size and shape before carbonization than could be made from substances in mass.

And besides that, it was a very difficult and painstaking work to reduce the carbons to uniform size and of proper tenuity after carbonization. We succeeded in doing it, but our failures were many compared with one success. And even when we succeeded the conductors were deficient in uniformity and homogen*ie*ty. We decided that it was too expensive and unsatisfactory to work them down after carbonization.

Q. 85. What success did you meet with in making these fibrous carbons from willow twigs split up and the pith and bark removed, as you have stated, and bent to shape?

A. We made and used them a good deal, and they made very good lamps. The same is true of the excelsior.

Q. 86. How did the large carbons differ, if at all from the small carbon made of the same material?

A. They differed in size, length and resistance, as I have said. They did not differ in their properties as carbon incandescent conductors.

Q. 87. You say you experienced no difficulty in the sealing of your lamp from the heat generated by the lamp; why then did you use the soapstone disc just below the incandescent conductor?

1072 A. We used the soapstone discs in our first lamps as a mere matter of precaution. At first our lamps did not last as well as we wanted them to. We did not know to what particular cause, of many possible causes, to attribute this to. We suspected one might be the radiation of heat to the part where the lamp was sealed, by which the sealing might be rendered imperfect, thus admitting air to the chamber of the lamp. To avoid this heat radiation we introduced the soapstone disc and the spirally formed conductor, by which means we avoided the heating of the base of the lamp, which was objectionable not only as regards the sealing of the lamp, but also the handling of it. We thought it a good device and patented it. We subsequently ascertained that it was not necessary, and ultimately left it out.

Q. 88. In answer to question twelve you say that in some cases you stuck several thicknesses of paper together before carbonization. Why did you do that?

A. When we wanted a thick carbon we stuck together several thickness- of the paper. When we wanted a thin or fine carbon we made it of a single thickness, or a less number of sheets stuck together.

ALBON MAN.

Direct examination closed.

Subscribed and sworn to before me this 27th day of June, 1887.

JOHN A. SHIELDS,
Examiner, etc.

Upon the conclusion of the foregoing examination-in-chief, defendant's counsel enters the following objections to the question mentioned in each objection, and it is consented that said objections shall have the same force and effect as if made upon the conclusion of each of said questions:

Q. 7. Objected to as calling for a conclusion, and it is insisted that the witness must state what was done by him and Sawyer, which it is asserted constitutes the making of the invention, and witness must define what the invention so alleged to be made is.

1073 Q. 8. Objected to as calling for a conclusion, and it is insisted that the witness must state the facts which it is claimed constitutes a reduction to practice.

Q. 9. Objected to upon the grounds that the question assumes that the invention was reduced to practice and does not call for any fact or facts which show such a reduction to practice; and further that the question calls for a conclusion of the witness as to what was "used," whereas inquiry should be made as to the facts alleged to constitute a use.

Q. 10. Objected to as calling for a conclusion, and defendant's counsel insist that it is entirely improper to ask the witness as to the kinds of wood used, but must ask the witness concerning the facts upon which the alleged use is based.

Q. 16. Objected to as irrelevant and immaterial.

Q. 17. Objected to as calling for a conclusion, and not as to any facts.

Q. 19. Objected to as irrelevant and immaterial.

Q. 21. Same objection, and as calling for a conclusion.

Q. 22. Objected to as irrelevant and immaterial.

Q. 23. Objected to as calling for a conclusion, and defendant's counsel insist that the witness must be asked concerning the facts alleged to constitute the making of the invention; and further, that witness must be compelled to define what the invention of the second claim is.

Q. 24. Same objection.

Q. 25. Same objection.

Q. 27. Objected to as irrelevant and immaterial.

Q. 28. Same objection, and as calling for a conclusion.

1074 Q. 39. Objected to as incompetent, and that the papers must speak for themselves.

Q. 42. Objected to as calling for a conclusion and not asking for any facts.

Q. 44. Same objection.

Q. 49. Objected to as incompetent, irrelevant and immaterial.

Q. 50. Same objection.

Q. 51. Same objection.

Q. 52. Same objection.

Q. 53. Same objection.

Q. 54. Same objection.

Q. 55. Same objection.

Q. 56. Same objection, and as calling for a conclusion.

Q. 62. Same objection as to Q. 49.

Q. 63. Objected to as calling for a conclusion, and as incompetent, irrelevant and immaterial.

Q. 64. Same objection.

Q. 66. Objected to as calling for a conclusion.

Q. 67. Same objection.

Q. 68. Same objection.

Q. 69. Objected to as incompetent, irrelevant and immaterial, and as not calling for any testimony concerning lamps in which the invention of the patent in suit was employed.

Q. 71. Objected to as incompetent, irrelevant and immaterial, and further that the testimony in the interference referred to cannot be made a part of the testimony-in-chief in this case by reference and general corroboration.

Q. 72. Objected to as calling for a conclusion and not as to any facts, and as entirely incompetent, irrelevant and immaterial, and upon the further grounds stated in objection to Q. 71.

Q. 78. Objected to as incompetent, irrelevant and immaterial, and as calling for a conclusion, and, further, as not defining what the invention in suit is.

1075 Q. 79. Same objection.

Q. 80. Objected to as incompetent, and as calling for a conclusion and not for any facts.

Q. 81. Same objection.

Q. 82. Same objection.

Q. 83. Objected to as incompetent, irrelevant and immaterial.

Q. 84. Same objection.

Q. 85. Objected to as calling for a conclusion and not for any facts.

JUNE 27TH, 1887.

Met pursuant to agreement.

Present, counsel as before.

Cross-examination by Mr. TOMLINSON:

X Q. 90. Who prepared the original application for the patent in suit?

A. I do not recollect; I think a Mr. Baldwin had something to do with it, whether he prepared it or not, I can't say.

X Q. 91. Where did you execute the application?

A. I can't recollect.

X Q. 92. Did you and Mr. Sawyer execute it at the same time and before the same officer?

A. I think not at the same time, whether it was before the same officer or not I could tell better by looking at the papers.

X Q. 93. What makes you think that you and Mr. Sawyer did not execute the application at the same time?

A. My recollection of the matter.

X Q. 94. Please to state what you recollect on this subject that gives you this opinion?

A. My recollection is that Mr. Sawyer executed the paper first, and then it was brought to me and I executed it.

X Q. 95. Did you know of its preparation prior to its being brought to you?

1076 A. Yes, I think so.

X Q. 96. Do you know whether you did or not?

A. That is my recollection.

X Q. 97. Had the preparation of this application been a matter of consultation between you and Mr. Sawyer prior to its preparation?

A. Yes, sir.

X Q. 98. Was the application prepared by a lawyer or solicitor of patents, and if so, by whom?

A. I think the draft of the application was made by Mr. Sawyer and myself, or some minutes with reference to it, that Mr. Baldwin, who is a patent solicitor and attorney at Washington, prepared the application, or had it prepared, I don't know which, from the draft or minutes which Mr. Sawyer and I prepared.

X Q. 99. Did you have any interview or consultation with Mr. Baldwin with regard to the application before it was prepared?

A. Yes, sir.

X Q. 100. How many, should you think?

A. At this distance of time I can't recollect more than one.

X Q. 101. As many as three or four?

A. It may be, I don't know.

X Q. 102. Was Mr. Sawyer present at these interviews?

A. No, sir; I think not.

X Q. 103. Where did these interviews take place?

A. In New York.

X Q. 104. At whose office?

A. The first was at my office, No. 3 Mercer street, another at the office of the Electro-Dynamic Light Company, No. 11 Nassau street, still another, and I think several in the Tribune building.

X Q. 105. At whose office in the Tribune building?

A. Mr. Cheever's—Charles A. Cheever.

1077 X Q. 106. Were these all anterior to the preparation of the application?

A. Yes, all these that I have spoken of.

X Q. 107. Having specified three interviews with Mr. Baldwin, and having said several others may have taken place at the Tribune building, are you not now quite confident that more than one took place?

A. Yes.

X Q. 108. Did you retain Mr. Baldwin to prepare the application, or was he retained by some one else?

A. I did not retain him, but I think it would be considered that he was retained by the Electro Dynamic Light Company, by this I mean that I did not retain him personally; I probably did so for the Electro Dynamic Light Company.

X Q. 109. I do not understand your last answer; did you, in person, see Mr. Baldwin, or retain him either for yourself or on behalf of others?

A. I made a bargain with him in regard to the matter for the Electro Dynamic Light Company.

X Q. 110. Was this at your first interview with him?

A. No, sir; I think not.

X Q. 111. What I desire to know is whether Mr. Baldwin had been spoken to by others in this matter before you saw him, or whether his connection with the matter originally came from you?

A. I think Mr. Baldwin was employed at the suggestion of Mr. Cheever.

X Q. 112. Was this before you had seen Mr. Baldwin?

A. The suggestion, I think, was before I had seen Mr. Baldwin, or at the time I first saw him.

X Q. 113. What was Mr. Cheever's connection with the matter?

A. Mr. Cheever wanted an exclusive right for the invention from the Electro Dynamic Light Company that owned it, reserving only the right of the Electro Dynamic Light Company itself to use it, as I recollect, and it may be that he wanted the whole right, I cannot recollect at this time. 1078

X Q. 114. Are you speaking of a time anterior to the preparation of the application?

A. Yes, sir.

X Q. 115. From whom did Mr. Cheever first hear of the invention?

A. I think from me, but I do not know.

X Q. 116. When did he first hear of it from you?

A. Some time before this application was made, how long I can't recollect.

X Q. 117. Did you have more than one interview with Mr. Cheever?

A. Yes, I saw Mr. Cheever several times, not in reference to this subject-matter; this subject-matter came up incidentally at first, in talking with Mr. Cheever about the matter of electric lighting; he called on me at my office a number of times, he was interested in the Jablockoff patent, and was endeavoring, as he represented, to form a combination of electric lighting interests.

X Q. 118. How long before the application was filed did you tell Mr. Cheever about this invention?

A. About a month or two, it may have been more.

X Q. 119. A month or two is your best recollection?

A. Yes. It was in the fall preceding this application.

X Q. 120. Had Mr. Cheever heard of this invention from others, or were you the first to tell him of it?

A. As far as I now recollect I was the first to tell Mr. Cheever of it, though since you called attention to the subject-matter, it seems to me possible that he had seen Mr. Sawyer before I spoke of the subject-matter to him, and may have also heard it from Mr. Sawyer.

X Q. 121. But is it your recollection that you were the first to inform him of the invention, and that he had not heard of it from others?

1079 A. My recollection in regard to the matter is just this, that Mr. Cheever first came to me with a letter of introduction from a friend, and that by an appointment then made and continued he came to my office to see me several times, to talk about electric lighting matters, and that I very fully explained to him at these times many of the inventions which Mr. Sawyer and I had made, among others the subject-matter of the patent in controversy. I remember that at some of these interviews he spoke of matters that Mr. Sawyer had told him about, whether this was one or not I can't recollect, I simply recollect that I told him of it.

X Q. 122. Do you recollect now whether you were the first to inform him of this invention, or whether he had heard it from others first?

A. I cannot, but my impression is that I told him of it first, still I cannot be certain of it.

X Q. 123. Who gave you this letter of introduction to Mr. Cheever?

A. I should think either Mr. Wm. Man, my cousin, or my uncle, Mr. A. P. Man, I don't recollect which.

X Q. 124. You say in your 111th answer that you think Mr. Baldwin was employed at the suggestion of Mr. Cheever, how did Mr. Cheever come to suggest the employment of counsel?

A. Through an arrangement he had made with the Electro Dynamic Light Co.

X Q. 125. What was the arrangement, and when was it made?

A. It was made some little time prior to the application for the patent, I cannot give the exact agreement between Mr. Cheever and the Electro Dynamic Light Co. without the papers before me, and I don't know where they are.

X Q. 126. Was there an agreement in writing between Mr. Cheever and that company?

A. Yes, I think so.

1080 X Q. 127. Do you know where that agreement is?

A. I do not.

X Q. 128. When, and in whose possession did you last see it?

A. I don't recollect.

X Q. 129. Were the papers of the Electro Dynamic Light Co. preserved?

A. They were at that time, yes, sir.

X Q. 130. When was this agreement last in possession of the company?

A. That I don't know.

X Q. 131. Who has the papers of that company now?

A. I don't know, only as to some of them.

X Q. 132. Who, on behalf of the company, conducted the negotiations resulting in this agreement with Mr. Cheever?

A. The directors of the company.

X Q. 133. Which of the directors?

A. I think all of them.

X Q. 134. Mention their names.

A. Mr. Laurence Myers, Mr. Jacob Hays, Mr. Wm. Hays, Mr. Hugh McCulloch, Mr. Horace Little (I think he was a director at the time, I am not certain), Mr. Sawyer, Mr. Thomas Wallace, myself, Mr. H. L. Judd, no other names occur to me at present.

X Q. 135. Which of these gentlemen, to your own knowledge, conducted these negotiations with Mr. Cheever?

A. Written propositions were sent to the company from Mr. Cheever. The trustees met and considered them, and answered them, and the result was finally an agreement between the company and Mr. Cheever.

X Q. 136. Which of these gentlemen to your own knowledge personally saw Mr. Cheever?

A. I think they all saw him, I think he was present at that meeting.

1081 X Q. 137. Did you have any interview with Mr. Cheever on this subject?

A. Yes, sir; I should think so.

X Q. 138. Do you remember what the substance of this agreement was?

A. Not very fully, I remember some of it.

X Q. 139. You say in your 124th answer that Mr. Cheever came to suggest the employment of counsel through an arrangement with the company, what was there in this arrangement which gave to Mr. Cheever the right or opportunity to make this suggestion?

A. I have already explained that Mr. Cheever was endeavoring to secure the right to use the invention or some part of it of the subject-matter of this patent in controversy. He sought to have the patent prepared and obtained by his own counsel, as I suppose any one would under those circumstances.

X Q. 140. Was there anything in this arrangement which gave Mr. Cheever the right to select counsel?

A. My impression is that there was, I cannot be certain at this length of time.

X Q. 141. How long before the application was filed was this arrangement made?

A. I do not know. I can give my best recollection in regard to it.

X Q. 142. What is your recollection?

A. That, a few days before the application was prepared for filing, this agreement was entered into, perhaps a week, perhaps less, perhaps more.

X Q. 143. The application for the patent in suit was filed January 9th, 1880, and was verified January 8th, 1880. How long was the application prepared before it was filed?

A. I think it was completed on the same day that it was verified.

X Q. 144. Was it prepared on the same day?

A. That I don't know. The minutes for the application
1082 made by Mr. Sawyer and I were made previous to the day of execution.

X Q. 145. Was this agreement with Mr. Cheever at about the time of the interviews you had with Mr. Baldwin to which you have referred?

A. No; prior to any interview with Mr. Baldwin; but whether the written agreement was dated at aboat that time I don't know. The actual agreement was made prior to that time.

X Q. 146. What was there in the subject-matter of this agreement which made Mr. Cheever desire to employ his own counsel?

A. I can't answer in any other way than I have answered it in my 139th answer.

X Q. 147. Was Mr. Cheever, as stated by you, desiring to secure the right to use this invention? and was his desire to employ counsel due to the fact that he wished to employ counsel in whom he had confidence?

A. I assumed such to be the fact.

X Q. 148. Did Mr. Cheever contemplate going into the business of electric lighting?

A. He was already engaged in the business of electric lighting.

X Q. 149. What rights did this contract give him?

A. The right to use this invention on the payment of a certain sum of money within a specified time.

X Q. 150. How extensive was the right, both territorially and as to his right to assign to others?

A. I can't recollect the exact details of the agreement. My impression is that he was to have the right to use the invention and have the right to license others to use it throughout the United States. Not the whole invention, but some specified portions.

X Q. 151. Was his right exclusive as against the company?

A. I don't recollect; my impression is that it was not ex-
1083 clusive against the company, but I think the company was
not to license anybody else. I may be mistaken about its not being exclusive.

X Q. 152. Within what time was Mr. Cheever to make the payment you have referred to?

A. I can't recollect the exact time. It was perhaps sixty days.

X Q. 153. Was the time fixed by days, or upon the happening of some event?

A. No, sir; it was a fixed time, not depending on any contingency.

X Q. 154. What was the sum he was to pay?

A. My recollection, one hundred thousand dollars.

X Q. 155. Did he ever pay the money and acquire his rights?

A. No, sir; he allowed it to lapse.

X Q. 156. Did his rights lapse on the expiration of the period named in the contract, or was the contract time extended?

A. I do not recollect any extension; still, I could not swear that there was not any extension.

X Q. 157. Did this contract include the other patents to Sawyer and Man?

A. No, sir.

X Q. 158. You say his right was of a specified portion of the invention; what portion?

A. My recollection of the matter would be that his rights were to be confined to paper carbons.

X Q. 159. Do you know why Mr. Cheever did not consummate this contract?

A. I do not.

X Q. 160. Do you know who was the first person to whom Mr. Cheever broached the subject of the purchase of this right, and who was the person who first broached the subject to him?

A. I think I do.

1084 X Q. 161. Who?

A. I think he first broached the subject to Mr. Sawyer.

X Q. 162. Did he approach Sawyer or Sawyer him?

A. I don't know.

X Q. 163. Who procured the signature of Thomas Wallace to the paper concurring in the appointment of Mr. Baldwin as the attorney in charge of the application? I refer to the paper dated January 9th, and witnessed by you?

A. I don't know. It must have been done by a resolution of the board of directors. I do not recollect the paper.

X Q. 164. At the time this application for a patent was signed, to wit, January 8th, 1880, had not you and Mr. Sawyer quarreled?

A. Before this time we certainly disagreed; I don't think we ever quarreled.

X Q. 165. Was not the Eastern Electric Manufacturing Company formed on the 17th of January, 1880?

A. I have no personal knowledge of the matter, but the certificate of incorporation appears to have been filed on that day.

X Q. 166. Was not that company organized by Mr. Sawyer hostile to the Electro Dynamic Light Co. and the Sawyer and Man interest?

A. I so understood it, and believe that to be the fact.

X Q. 167. Is it not true, then, that at this time, to wit, January, 1880, Sawyer was hostile to the Electro Dynamic Light Company and to the Sawyer and Man interest?

A. I think it is.

X Q. 168. Had not, at this time, your association with Mr. Sawyer as an experimenter, and your personal relations with him ceased?

A. My associations with him as an experimenter had ceased. My personal relations with him had not, if you mean by personal relations personal intercourse.

1085 X Q. 169. Did you not at this time know him to be a man capable of dishonest and dishonorable acts?

A. I believed him to be then, especially at such times as he was under the influence of liquor.

X Q. 170. When did Sawyer and Man cease their experimental work?

A. About March, 1879?

X Q. 171. About when was the last application of Sawyer and Man for a patent prior to the application in suit filed?

A. I can't recollect.

X Q. 172. Had the filing of this application any connection, or was it prompted in any way by the publication in December, 1879, of Mr. Edison's experiments?

A. Yes, I think it had something to do with the filing of this application, in this way: During all the fall of 1879, the Electro Dynamic Light Co. had been trying to get Mr. Sawyer to unite with me in application for patents, this among others. He had refused to do so, except upon conditions not satisfactory to the company; and I think the fact of the publications of Mr. Edison had to do with Mr. Sawyer's consenting to make this application. In fact, I know that; I know the argument was used with Mr. Sawyer by myself when things appeared in the papers claiming what Mr. Sawyer and I had personally invented, that if we laid still and did not make application for them that patents would be granted to others.

Adjourned till Tuesday, the 28th inst., at 1 p. m.

1086 TUESDAY, *June* 28, 1887.

Met pursuant to adjournment.

Present counsel as before and the cross-examination of Mr. MAN proceeded as follows:

Counsel for complainant*s* objects to the cross-examination taken yesterday, June 27, 1887, on the ground that the cross-examination is not pertinent or relevant to anything brought out in the examination-in-chief, and is not in fact cross-examination, and gives defendant's counsel notice that in such examination he makes the witness his own, and that he shall insist on his right to cross-examine the witness upon any matter brought out by the examination that does not pertain to the matter brought out on the examination-in-chief, and counsel further objects on the ground that none of the matter brought out by the examination of yesterday has any pertinency or relevancy to any issue in the cause, and gives defendant's counsel notice of the motion to strike it out.

Counsel for defendant consents that this objection and notice shall have the same force and effect as if made when the questions were asked.

X Q. 173. How long a time elapsed between your first seeing Mr. Baldwin in regard to this application and the filing of the application?

Same objection and notice.

A. I can't recollect definitely.

X Q. 174. What is your best recollection?

Same objection.

A. My best recollection would be, a day or two from that to a week prior to the day of the execution of the application, which was one day prior to the filing.

X Q. 175. Was not the arrangement with Mr. Cheever made prior to your seeing Mr. Baldwin?

Same objection and notice.

1087 A. I can't recollect.

X Q. 176. Do you recollect how Mr. Baldwin came to be in New York at this time?

Same objection and notice.

A. I don't know as I ever knew in regard to it, except that he told me he was attending to other business beside this, and went out to keep appointments therein.

X Q. 177. Did not Mr. Cheever tell you, or write you, that he would telegraph Mr. Baldwin to come on at once?

Same objection and notice.

A. I don't remember.

X Q. 178. If he had so written you, do you think you would have remembered it?

Same objection and notice.

A. I might, or I might not.

X Q. 179. Did Mr. Cheever ever write, or state to you immediately prior to the filing of this application that he was anxious to have it get in the office before the Edison patent was issued?

Same objection and notice.

A. I don't know. I do know that he was not as anxious to have it filed as I was.

X Q. 180. Will you swear that he did not so state to you?

Same objection and notice.

A. I have already said that I did not know.

X Q. 181. Will you swear that you did not know, prior to the filing of this application, that Mr. Cheever's object in getting control of the invention, and in preparing and filing the application, was to get an interference with what he, Mr. Cheever, supposed to be a pending application of Mr. Edison's?

Same objection and notice.

1088 A. I will swear that it was my object and intent to get the application for the patent filed at the earliest day possible, for fear that there might be other applications by other parties, and especially Mr. Edison, already filed in the Patent Office, and I think that both Mr. Cheever and I frequently discussed this matter, and both intended that if any such application were on file to get in interference with it.

X Q. 182. Did you not know that it was Mr. Cheever's purpose to try and sell this application and invention to the Edison Electric Light Co.?

Same objection and notice.

A. No, sir; not especially to the Edison Electric Light Co.

X Q. 183. Did you not know that he intended trying to sell the application and invention to the Edison Electric Light Co., or to others, for a sum larger than the hundred thousand dollars mentioned in his option?

Same objection and notice.

A. No, sir, I did not; on the contrary, it was fully understood, so far as I was concerned, that the application should be prosecuted. It was not to be sold as an application to anybody, as I understood it, but I did fully understand that the invention might be sold by Mr. Cheever, and that he expected to make money in buying it. The only object that I could understand in Mr. Cheever's taking hold of the matter was to make money out of the invention.

X Q. 184. Let me ask you right here whether, since the last session, you have been informed that I have seen Mr. Cheever and had access to his books, letters, papers and memoranda?

Same objection and notice.

A. No, sir, I have not; but I have been informed that you have made application for such purpose, and I expected that you would do so.

X Q. 185. When did you get this information?

1089 Same objection and notice.

A. I got it to-day, but I expected that you would make such application from the outset and in course of your examination.

X Q. 186. Do you remember asking Mr. Cheever, prior to the preparation of this application, and when he made you the conditional offer of a hundred thousand dollars, whether he represented the Edison people or intended to sell to the Edison people, and his replying that he would sell it wherever he could get the most money for it?

Same objection and notice.

A. I recollect at several times asking Mr. Cheever whether he was the agent of, or represented the Edison people, and also asking him whether he represented, or was agent for the United States people, or what was known as the Maxim people. I think it highly probable that this was in reference to other transactions with Mr. Cheever mainly, though possibly with reference to this transaction. I don't recollect distinctly the answer which you propose as made by Mr. Cheever, but think it highly probable, and if Mr. Cheever should say so, I should believe that he made that answer.

X Q. 187. Is it true that before this application was filed you knew Mr. Cheever's object to be to sell out the invention to parties other than the Sawyer and Man interest?

Same objection and notice.

A. Of course I expected that he would sell it, or give licenses to use it.

X Q. 188. Is it not also true that you knew that he thought that the most likely purchaser would be the Edison Company?

Same objection and notice.

A. The fact is that I strongly suspected that Mr. Cheever was the agent of the Edison Company in the transaction.

1090 X Q. 189. Were you not very early disabused of any such suspicion?

Same objection and notice.

A. On the contrary, I was led to believe, and still believe, that it was a manœuvre of the Edison Company, and I will add right here that one or more patents of Sawyer and Man abroad were sold through parties representing themselves as acting for foreign capitalists interested in electric lighting, and it subsequently turned out that the sale was made to Mr. Edison and Mr. Swan, or the companies they represented.

Defendants' counsel moves to strike out all after "I will add right here" as irresponsive.

X Q. 190. Manœuvre of the Edison Company to do or get what?

Same objection and notice.

A. To secure for themselves this invention and the patent therefor.

X Q. 191. And you thought, and think Mr. Cheever was acting for the Edison Company in this behalf?

Same objection and notice.

A. I answered before that I was led to believe, perhaps I should have said suspect that he was acting for the Edison Company, and had some encouragement from them in the matter. That suspicion has never been removed.

X Q. 192. Then, was it your opinion at that time, and is it your opinion now, that Mr. Cheever was acting for and in the interest of the Edison Company?

Same objection and notice.

A. I cannot express it more clearly or succinctly than I have already done. I will say that I thought then that such might be the fact, and I have seen no reason to change my opinion.

1091 X Q. 193. Well, now, what do you mean, that you think he was at this time acting for the Edison Company, or that you did not so think?

Same objection and notice.

A. I mean just what I say, that I suspected it, and didn't know what to believe fully, sometimes I think I believe it, and sometimes I was in doubt, and am in doubt to-day.

X Q. 194. If Mr. Cheever represented the Edison Company, what object could he have had in trying to stop the issue of Mr. Edison's patent by applying for a patent on this alleged invention?

Same objection and notice.

A. A great many people, including Mr. Cheever, knew what Sawyer and Man had done in this matter, and if the Edison people knew it nothing was more natural than that they should desire to control it.

X Q. 195. Question repeated.

Same objection and notice.

A. If the invention of Sawyer and Man were older and better, and he represented the Edison Company, they would control their own application and could also carry on this application without controversy. Mr. Cheever as their agent, might properly be following out their instructions in that particular to prevent future contests, or on the other hand he might be seeking to make money for himself alone.

X Q. 196. In this connection, let me ask whether you were aware of the efforts of Mr. Cheever and Mr. Baldwin to obtain surreptitiously from the Patent Office the position and status of Mr. Edison's applications?

Same objection and notice.

A. No, sir.

X Q. 197. Are you quite confident of that?

Same objection and notice.

1092 A. I am.

X Q. 198. Do you think it possible that you may not be mistaken?

Same objection and notice.

A. I am quite confident of it.

X Q. 199. Are you confident that Mr. Cheever never wrote you on this very subject, and prior to the filing of this application?

Same objection and notice.

A. No, I am not.

X Q. 200. Do you mean he may have so written you on this subject?

Same objection and notice.

A. He may have written me, but the substance of his letters I have not in mind and know nothing about it.

X Q. 201. In this connection let me also ask whether Mr. Cheever did not inform you by letter, that, owing to a depression in the Edison stock, he could not sell out then, and ask you for a further extension until there was another Edison boom?

Same objection and notice.

A. I do not recollect it.

X Q. 202. Are you confident he did not so write you?

Same objection.

A. I have no recollection, that is all I can say.

X Q. 203. Do you wish to be seriously understood as seriously thinking that Mr. Cheever was acting for the Edison Company, and in its interest?

Same objection and notice.

A. I mean to be understood as saying as I did before, that I suspected it, sometimes believed it, and that the suspicion has never been removed from my mind.

X Q. 204. As you now know that I have seen Mr. Cheever
1093 and the papers that he has, I desire to ask whether you now
adhere to the statements made by you yesterday, and which
I shall point out? Are your answers to the 108th and 109th questions true?

Same objection and notice.

A. I think so; I think they are right. Perhaps the word "bargain" may be stronger than I intended. I had an understanding with him.

X Q. 205. Is your answer to question 117 true. I refer particularly to where you said "this subject came up incidentally at first"?

Same objection and notice.

A. Yes, that is my recollection of it.
X Q. 207. Are your 118th and 119th answers true?

Same objection and notice.

A. That is my recollection of it. You will understand me as speaking from recollection only. I don't know anything more about it than I did then.
X Q. 208. Are your 132d to 138th answers, inclusive, true?

Same objection and notice.

A. My recollection is that Mr. Cheever was at the meeting of the directors at this time in reference to this subject-matter, I may be mistaken about it.
X Q. 209. Have you any personal objection to Mr. Cheever's furnishing to the counsel for the defendant his various papers and letters relating to this subject?

Same objection and notice.

A. I have no personal objection. So far as the matter of the business of the company is concerned, I might have objections; that, I could tell better after looking at the papers. In regard to matters not relating to this suit, I object, on general principles, to my correspondence with other people, or their letters to me being produced.
1094 X Q. 210. Have you any personal objection, provided it be proper evidence, to the entire truth in regard to this matter being told by whoever may know it?

Same objection and notice.

A. I have no objection personally to the whole truth in regard to any matter pertinent to the issues in this case being told. In regard to confidential matters between myself and other people, not pertinent to this issue, I have objections.
X Q. 211. In all these questions, are you willing that the court should determine the question of pertinency?

Same objection and notice.

A. The court will ultimately determine the question of pertinency, and I will adhere to my opinion in regard to the pertinency of the matters sought to be introduced here, and the opinion of the counsel for complainant, and will endeavor to keep out matters that are not pertinent.

Mr. Cheever, who is now present, produces certain papers in his possession in one bundle, to be cared for by the examiner as Mr. Cheever's agent, and to be returned to Mr. Cheever at his request, counsel for both parties to have access to the same while in the examiner's possession until recalled by Mr. Cheever.

Adjourned until Thursday, the 30th inst., at 1.30.

THURSDAY, *June 30th*, 1887.

Met pursuant to adjournment.

Present, counsel as before, and the cross-examination of Mr. MAN continued as follows:

X Q. 212. Since Mr. Cheever produced his papers at the last sitting, have you read the same, and have you also read what purport to be copies from his letter books of letters written by him to you in December, 1879, and in the year 1880?

1095 Objected to as incompetent, irrelevant and immaterial, and not cross-examination, and notice of motion to strike out this question and answer is hereby given.

A. I glanced at the package of papers which was left in the possession of the examiner by Mr. Cheever at the time they were handed to him at the last session and cursorily read parts of some of them. I have this morning read over what purported to be extracts from Mr. Cheever's letter book of letters from him to me and other people, including W. E. Sawyer and Mr. Baldwin.

X Q. 213. Did you have any personal acquaintance with Mr. Cheever before he called on you in relation to this alleged invention?

Same objection and notice.

A. I have already stated the manner and time of my becoming acquainted with Mr. Cheever, to the best of my recollection. The question assumes that he called upon me with reference to this invention. Such is not my recollection of the fact, and I do not think that the subject-matter of the invention was a matter spoken of by either Mr. Cheever or myself for some little time after he first called upon me, and then, as I said before, my recollection is that it was mentioned by me to Mr. Cheever incidentally. I had no acquaintance with him before his first calling upon me with a letter of introduction.

X Q. 214. Please look at the paper that I hand you, and state whether it is in your handwriting, and whether it was sent by you to Mr. Cheever.

Same objection and notice.

A. The paper referred to is a letter dated January 5, 1880, to Charles A. Cheever, Esq., it is in my handwriting, signed by me.

Defendant's counsel offers the letter just shown witness in evidence, and the same is marked, "Defendant's Exhibit Man-Cheever Letter," January 5, 1880, June 30, 1887.

1096 Exhibit objected to as incompetent, irrelevant and immaterial, and not cross-examination, and same notice is also given.

Complainant's counsel stipulates that a copy of the exhibit just offered in evidence may be received in evidence with the same force and effect as the original, and subject to the same objections and notice.

X Q. 215. This letter says:

"Yours of this morning received."

Have you in your possession the original letter to which you in this exhibit refer?

A. I do not think I have.

X Q. 216. Will you make a search for the letter referred to, and let me know the result of such search at the next sitting?

A. Yes.

X Q. 217. Please look at the paper I now hand you, and state whether you remember receiving a letter from Mr. Cheever similar to this, and, if you can, whether this is a copy of the letter referred to in Defendant's Exhibit Man-Cheever letter.

Same objection and notice.

Defendant's counsel in looking over the papers given by Mr. Cheever at the last session to the examiner, notices that an original telegram which forms part of said papers has been removed, and requests the examiner to state on the record every fact within his knowledge in regard to the removal of the same.

The examiner states that on yesterday afternoon, about three o'clock, Mr. Bull, one of complainant's counsel, came to examiner's office, and said that Mr. Cheever desired to see his papers in examiner's charge, for the purpose of removing such as were confidential; that examiner, alone, thereupon took the package of papers to Mr. Cheever, whereupon Mr. Cheever looked over the same 1097 and detached therefrom a paper, which appeared to be a telegram, and thereupon handed the remaining papers back to the examiner.

A. I recollect receiving letters from Mr. Cheever during the fall of 1879, and the year 1880. I recollect generally the subject-matter of Mr. Cheever's letters, not, however, to identify by a copy any particular letter, or the contents of any particular letter. If the paper produced is a copy of a letter sent by Mr. Cheever and received by me. I do not think it is the letter of Mr. Cheever referred to by me in my letter to him of the 5th of January, and last put in as exhibit in this case. I do not identify this as the copy of a letter received by me.

X Q. 218. Between now and the next sitting will you look carefully among your papers to see if you have the following letters to you from Charles A. Cheever, substantially as follows:

1. A letter dated January, addressed to you and signed by him, and stating in substance as follows:

"Please bear in mind that the sale of Sawyer light invention, as talked of between us on Saturday last, it is of the utmost importance that I should have the refusal from your company at a very early date. You are, of course, aware the only chance of getting a large price for it is by taking advantage of the present boom on the subject, I hope to hear from you as to progress.

"If the Edison excitement dies out before you give me a chance to take action, the object of my present customer will be frustrated to a great degree, and it is doubtful if he would want it at all.

"Yours truly, CHARLES A. CHEEVER."

2. A letter addressed to you, dated September 30, 1880, and signed by him, stating in substance as follows:

1098 "I note Mr. Baldwin's request in his letter of September 27th, that you furnish him with a full memoranda as to the facts of this invention, especially, exactly what was done with the carbonized paper itself. I will have you do this in writing, include what you told me verbally yesterday and such of the facts as occur to you, and send the same to me, that I may familiarize myself with it and send the same to Mr. Baldwin.

"Yours truly, CHARLES A. CHEEVER."

3. A letter addressed to you, dated July 24, 1880, and signed by him, stating in substance as follows:

"I have information from a party who has recently visited Menlo Park that there will be shortly another electric light boom. I wish to see you in regard to the matter of our horseshoe patent application and other points in regard to the matter. Please call on me between twelve and two either Monday or Wednesday of next week. I shall be out of town Tuesday, am obliged to leave my office early every afternoon in order to reach Rockaway.

"Yours truly, CHARLES A. CHEEVER."

4. A letter addressed to you, dated June 22, 1880, and signed by him, stating in substance as follows:

"I heard from Mr. Baldwin some days ago that it would probably be necessary to appeal the examiner's decision in the horseshoe application, but that there was no hurry in the matter, he would let us know in time and defer acting immediately, understanding that he wished not to incur expense in the matter.

1099 Is there anything new in the matter I spoke to you about some days ago?

"Yours truly, CHARLES A. CHEEVER,
"Per W. S. C."

5. A letter addressed to you dated Feb. 26, 1880, signed by him, and stating in substance as follows:

"I enclose herewith lithograph copy of the ∩ form electric lamp. This is taken from the patent-application drawing; I thought perhaps you would like to have it with your copy of the papers. I understand Mr. Church has kept you posted as to my operations. I have not heard from Mr. Sanders since day before yesterday.

"Yours truly, CHARLES A. CHEEVER."

6. A letter addressed to you dated Jan. 26, 1880, signed by him, and stating in substance as follows:

"Dear Sir: Would your company like to light a large building by electric light of your system? The building at present spends about twelve hundred dollars per annum for gas, and would pay same for electric light. Should like to see you on the subject.

"Yours truly, CHARLES A. CHEEVER."

"I haven't heard from you in answer to mine of the 20th."

7. A letter addressed to you dated May 12, 1880, signed by him, and stating in substance as follows:

"Dear Sir: How long before we may expect to see the new lamps completed? If you will let me know the prospect I will be obliged.
Do you not think it would be a good plan to secure the Hol-
1100 comb regulator if it can be done on proper terms? Holcomb
also has patents on generators which I believe are good. It strikes me he would be a good man to take charge of manufacturing lamps; possessing, as he does, intelligence, electric knowledge and persistency.

"I shall be out of town to-morrow, Thursday, but would like to see you Friday, if it would be convenient to call.

"Yours truly, CHARLES A. CHEEVER."

8. A letter addressed to you March 27, 1880, signed by him, and stating in substance as follows:

"Dear Sir: I have heard nothing more from Mr. Sanders in regard to your matters since the telegram sent to you day before yesterday.

"Since I saw you I have been thinking over the question of electric light exhibition, and am very much convinced of the importance of preparing for one. Can you not arrange with Wallace to have a consultation with him on the subject at my office some time Tuesday next, March 30th; I shall be away on Monday. At such a consultation we could canvass the various aspects of the case and see what was best. If Mr. Wallace would come with a memorandum as to what he had on hand in the way of apparatus which could be put in working shape in that order, it would be of assistance to us in making our plans. I think my electric knowledge is sufficient to take charge of putting up connections, and I know of an old assistant whom I had in telephone business who will work in it with me. At any rate, do not, please, leave Sawyer in charge.

"Yours truly, CHARLES A. CHEEVER."

"I shall be here only till 3.30 to-day. Let me know what you think of the above."

1101 9. Letter addressed to you dated Jan. 20, 1880, signed by him, and stating in substance as follows:

"Dear Sir: I enclose herewith copy of patent just received from Mr. Baldwin; you will observe that all mention of the Ω form is left out. Mr. Baldwin says the horseshoe and fibrous application of Edison is held for interference by the Patent Office. I have developed a new claim from Sawyer for which he applied for a patent within the last two weeks. Have you heard of it? I have a sketch of it. You had better call and see me; it is rather important.

"Yours truly, CHARLES CHEEVER."

10. Letter addressed to you dated Jan. 7, 1880, signed by him and stating in substance as follows:

"DEAR SIR: I enclose herewith a formal letter addressed to your company in regard to continuance of time for me in the arch-form electric matter. I rely on your kindness to more fully explain my views to your associates.

"I have been considering the idea of a combination, or amalgamation of all electric light interests, as suggested by you, and the more I think of it the more I like it. I shall have a plan of operations in the matter to submit to you within a few days. In the meantime I should like to have a written statement from you as to the various points you claim to control, and a list of patents on which you base your claims. I have set agents, who will not be recognized as coming from me, at work to get an idea of some of the other parties whom we will want to join with me.

"Yours truly, CHARLES A. CHEEVER."

1102 11. Letter addressed to you dated Jan. 5, 1880, 5 p. m., signed by him, and stating in substance as follows:

"I have been considering the matter proposed by you. I think perhaps the parties whom I have may be persuaded that it is for their interest to carry out your idea after a little time, but not at a day's notice, as they will wish to investigate the matter; this will take a little time. In regard to the particular lamp they want, *i.e.*, the Edison one, as talked of between us, after they have looked it up and are ready to come to a conclusion, as a 'bird in the hand is worth,' etc., I think it best to sell them what they want now, and then negotiate with them for the balance afterwards. You can get more selling a thing in two parts than we could in one lot. I have just seen Mr. Church; he says Sawyer has promised to do all in his power to help us along. I hope you will be ready to give a definite answer by to-morrow afternoon. I should prefer having my own lawyer draw the application for the horseshoe Edison patent, if we buy the invention. He will come to New York on telegraphic notice from me.

"Yours truly, CHARLES A. CHEEVER."

12. Letter addressed to you dated January 7, 1880, signed by him, and stating in substance as follows:

"I enclose copy of your letter to me of this date.

"Yours in haste, CHARLES A. CHEEVER."

Question objected to—

1st. Upon the ground that it has not been proved that any such letters were written by Charles A. Cheever or received by Albon Man.

2d. That it is not relevant or material or competent in any issue in this case, and

1103 3d. That it is not cross-examination, and notice is given by complainant's counsel that a motion will be made to strike it out, this question and answer.

A. If I am furnished with a list of them, yes.

Defendant's counsel requests the examiner to furnish the witness with a copy of the question at the earliest possible moment.

X Q. 219. If you find you have the letters mentioned in my 218th question, or any of them, will you produce the same at the next hearing?

A. I will be governed by the advice of counsel in regard to the matter.

X Q. 220. Will you bring the letters before the examiner at the next hearing, if you find them, or any of them, so that they may be here for such disposition as may be proper?

A. I will, if so advised.

Counsel for defendant request counsel for complainant to instruct the witness, in case he finds the letters referred to, or any of them, to bring them before the examiner at the next sitting, in order that they may be here present, in custody of the witness, for such disposition as may be proper.

Counsel for complainant declines to instruct the witness as requested by defendant's counsel, unless defendant's counsel can show that such letters have been written by Mr. Cheever and received by the witness, and show upon record that such letters are in some way pertinent and material upon some issue in this case.

X Q. 221. You have stated you would make search and see whether you had such letters, and you have heard read the request of defendant's counsel, and the reply of complainant's counsel. Now, if as a result of such search you find said letters, or any of them, will you produce them here at the next hearing?

A. That remains to be seen.

1104 X Q. 222. Do you decline to state now whether you will or will not produce them?

A. If I find that I have any such letters, and am instructed by counsel to do so, I will produce them. I have no personal objection in producing such letters if I have them, but I am almost certain that I have none.

X Q. 223. In making this search should you find any letters from Mr. Cheever other than those mentioned in my question, will you make a note of the date of such letters?

A. Yes.

X Q. 224. Does your letter to Mr. Cheever of June 5, 1880, refresh your recollection as to when you first made Mr. Cheever's acquaintance? You have stated that you made his acquaintance through his calling upon you with a letter of introduction from your cousin, Mr. Wm. Man, or your uncle, Mr. A. P. Man. In this letter you say:

"After seeing my cousins, I feel better acquainted with you."

Objected to as incompetent, irrelevant, immaterial and not cross-examination, and notice of motion to strike out.

A. It confirms me as to the accuracy of my recollection with regard to the time when I formed Mr. Cheever's acquaintance, as a considerable time prior to the writing of this letter.

X Q. 225. What do you mean by "considerable"?

Same objection and notice.

A. Some weeks prior, possibly more than a month.

X Q. 226. What did you mean by saying in this letter that after seeing your cousins you felt better acquainted with Mr. Cheever?

Same objection and notice.

A. Before this time I frankly told Mr. Cheever that I wanted to know more about him and what his associations were before talking with him further, and he referred me to my cousins, Frederick and Wm. Man.

1105 X Q. 227. Then, immediately prior to this letter, you did not know Mr. Cheever well?

Same objection and notice.

A. Not so well as I wanted to.

X Q. 228. To what did you refer in this letter when you state, "I am at work in regard to the matter to get our people together and answer you," and what was the "large project" you had to propose in place of your (Mr. Cheever's) proposition?

Same objection and notice.

A. I do not remember whether the proposition I was to answer was a proposition on his part with reference to the particular invention in this case, or a proposition with reference to all the patents and inventions of the Electro Dynamic Light Co. He made request in regard to fixing price upon all such patents and inventions, and also as to the invention now in interference, and I can't tell at this time which I referred to. The larger proposition, to which I referred, was the making of Mr. Cheever the instrument or agent for the consolidation of all electric light interests, a project which I deemed would result to the benefit of all parties by avoiding extensive litigation between them, and it was in reference to this matter that I wished to know more about him before talking with him further.

X Q. 229. From this letter it appears that Mr. Cheever had made you a proposition at this time, now what was this proposition to which you in this letter refer as his, it also appears in the letter that you had a "larger" project to propose in place of his proposition; now tell me specifically what this proposition was.

Same objection and notice.

A. I do not so read the letters. The words I use in the letter are,

"Yours of this morning received, and I am at work in regard to the matter to get our people together and answer you."

1106 I refer again to a "project" in place of your proposition the word "proposition" as used here does not imply necessarily anything further than a request to fix a price upon patents and inventions. I do not think in point of fact Mr. Cheever had made an offer for either at this time, for the whole or for any single patent or invention, but if he had the word "proposition" would refer to that.

X Q. 230. You have not been called upon to construe a paper you have never seen before, but you are shown one of your own letters in regard to a transaction in which you took an important part. You either do or do not understand your own letters. I don't want you to quibble on words and phrases, but to tell me, if you know what you meant, and to what you referred in this letter when you speak of "your" (Mr. Cheever's) proposition. If you don't know what you meant, say that, but answer my question?

Same objections and notice.

A. I repel with the scorn it deserves the base and unworthy intimation of quibbling, I think it unworthy of counsel, and utterly uncalled for. I have answered the question fully and entirely, and until some reasonable and proper question is asked me, I refuse to answer further.

X Q. 231. Upon now reading your letter, have you any recollection as to whether Mr. Cheever had stated anything to you which you could have described properly as "your" (Mr. Cheever's) proposition?

Same objection and notice.

A. Yes.

X Q. 232. Was there any matter in——

The witness here says, "I had not finished my answer." Witness continues his answer.

He had stated before this time to me in substance that he was in a position to make a sale of the patents and inventions of the Electro Dynamic Light Co., and that he desired either to sell 1107 them to others or purchase them for himself. He had proposed to me that the company should employ him to make a sale or sell them to him and make a price for them at which they would sell.

Defendant's counsel says that he will move to strike from the record the entire answer of the witness, beginning with "He had stated" as irresponsive.

X Q. 233. Was there any matter in regard to which you were at work on in getting your people together and answer Mr. Cheever?

Same objection and notice.

A. Undoubtedly there was, or I would not have said so in my letter.

X Q. 234. In my 229th question, I asked "What was this proposition to which you in this letter referred as his?" I also stated that it appeared in the letter that you had a larger project to propose in place of his proposition, and requested you to tell me specifically what this proposition was, to which you replied "The word 'proposition' as used here does not imply necessarily anything further than a request to fix a price upon patents and inventions. I do not think in point of fact Mr. Cheever made an offer at this time for the whole or for any single patent or invention, but if he had the word 'proposition' would refer to that." I did not, and do not understand that this answer was anything more than a carefully guarded statement as to what the word might mean, and a more carefully guarded concealment of what you thought them really to mean. If I am mistaken, I regret the severity of my language, but I adhere to my opinion, all I am anxious to know is, first, whether you remember now, not argumentatively or speculatively, but remember what you meant and intended to have Mr. Cheever understand by this letter. I ask this question courteously, and request you to answer categorically?

Same objection, and further that the question has been already fully answered.

1108 A. After reading the letter, I do remember what I intended Mr. Cheever to understand by that letter.

X Q. 235. You have stated that there was a matter at which you were then at work getting your people together. You state here in this letter that you "shall perhaps have a larger project to propose in place of your (Mr. Cheever's) proposition." I understand the fact to be that Mr. Cheever called upon you with the sole view of purchasing the alleged invention, and that you subsequently made to him the proposition that a consolidation of all the electric light interests would be desirable. In other words, at the time this letter was written, his sole proposition was as I have stated, and that the scheme to work at consolidating all the electric light interest eminated from you. Now, I wish to be fair to you, and I show you what purport to be copies of Mr. Cheever's letters to you at, and prior to the date of your letter to him, in which he appears to have written prior to January 5th, as follows:

"Please bear in mind that the sale of Sawyer light invention, as talked of between us Saturday last, it is of the utmost importance that I should have a refusal at a very early date. You are of course aware that the only chance of getting a large price for it is by taking advantage of the present 'boom' on the subject. I hope to hear from you as to progress. If the Edison excitement dies out before you give me a chance to take action, the object of my present customer will be frustrated to a great degree, and it is doubtful if he would want it at all."

I understand what I have just read to be the letter to which you replied in the exhibit; I have also what purports to be a letter to you from Mr. Cheever, dated January 5th, at 5 p. m., in which he says:

"I have been considering the matter proposed by you, I think perhaps the parties whom I have may be *pursuaded* to carry 1109 out your idea after a little time, but not at a day's notice, as they will wish to investigate the matter, this will take a little time. In regard to the particular lamp *i. e.*, the Edison one, as talked of between us, after they have looked it up and are ready to come to a conclusion as 'a bird in the hand is worth,' etc. I think it best to sell them what they want now, and then negotiate with them for the balance afterwards. You can get more selling a thing in two parts than we could in one lot. I have just seen Mr. Church; he says Sawyer has promised to do all in his power to help us along. I hope you will be ready to give a definite answer by to-morrow; I should prefer having my own lawyer draw the application for the horseshoe Edison patent if we buy the invention. He will come to New York on telegraphic notice."

You have stated that you knew what you meant by your letter of January 5th, was not the matter at which you were at work, this alleged invention, and did you not mean by "your" proposition, Mr. Cheever's proposition to get a refusal for it and to apply for a patent. And was not the "larger project" you had to propose the consolidation of the electric light interests?

Objected to—

1st. For the reason that none of the so-called letters quoted from by counsel are in evidence.

2d. That there is no proof in the case that such letters were ever written by Mr. Cheever or received by witness, and

3d. That there is no evidence that witness' letter is in response to the first letter quoted from by counsel in the nature of a proposition from Mr. Cheever. So that if the witness' letter, which is in evidence, is in response to any proposition to Mr. Cheever it could not be in response to that letter. Counsel objects on the further ground, as before, that the question is not pertinent to any 1110 issue in this case, competent or material, and not proper cross-examination, and counsel gives notice of motion to strike out this question and answer, and further objects to the question that it draws false inference from the so-called letters quoted from, and is misleading to the witness.

A. I think undoubtedly the "large project" to which I had reference in my letter of January 5th was the employment of Mr. Cheever in the matter of consolidating all electric light interests. My recollection does not confirm your statement of your understanding or opinion that Mr. Cheever first came to me to purchase this invention alone, but generally with reference to electric lighting matters, but as I cannot know what was in Mr. Cheever's mind or what his intentions were, except by what passed between us, I cannot know but that the purchase of this invention was his sole object. I can only know that other matters were proposed and talked of between us before the subject-matter of this invention came up. I do not think that Mr. Cheever's alleged letter to me first quoted by you is the one to which I replied in my letter of January 5th. The matter of selling all the patents of the electric light Co., and of selling the invention in controversy here, had been a subject of consideration before and up to the time of the writing of my letter of January 5th, it is possible that my letter of January 5th had reference solely to the proposition or plan to sell only the invention, the subject-matter of this controversy, but inasmuch as other propositions or plans were in hand at the same time, in my previous answer I simply wished to say that in my judgment, and according to the best of my recollection, my letter of January 5th did not have reference solely to the sale of the invention in controversy here, but rather reference to the whole subject-matter that had gone before and conversations previously had between Mr. Cheever and myself. I am confirmed in this view of the case from 1111 the fact that I yielded at last to the idea of selling this invention alone, for the reason that my co-inventor, Mr. Sawyer, was thereby induced to sign the application for the patent, which he had up to that time refused to do. I will add that in my own mind it is a matter entirely unimportant whether this letter had reference to the sale of one or the whole of the patents, and I only make the distinction for accuracy's sake, and because it accords with my recollection.

Defendant's counsel gives notice that he will move to strike out all that portion of the witness' answer near the conclusion thereof, and beginning "I am confirmed in this view of the case," as irresponsive.

Adjourned till Friday, July 1st, at 11 a. m.

FRIDAY, *July* 1*st*, 1887.

Met pursuant to adjournment.

Present: Counsel as before, and the cross-examination of Mr. MAN proceeded as follows:

X Q. 236. Since the last sitting, have you made careful search among your papers to ascertain whether you had the letters from Mr. Cheever to which I referred in my question yesterday?

A. I have.

X Q. 237. Have you found such letters, or any of them?

A. I have not.

X Q. 238. Did you find any letters from Mr. Cheever to you?

A. None whatsoever.

X Q. 239. Has your search been so careful that you are satisfied that the original letters sent by Mr. Cheever to you cannot be found or produced by you?

A. I may have some letters subsequent to the year 1880, 1112 but I do not think I have. I am confident that I have none of, or prior to, the year 1880 in my possession, and am very positive that I have none relating in any way to the subject-matter of this controversy.

It is stipulated between the counsel for the respective parties hereto, that defendants' counsel be allowed to treat the copies of Mr. Cheever's letters to Mr. Man, made from Mr. Cheever's letter book, and now in possession of counsel, in all respects as the original letters written by said Cheever to said Man, it being understood that the correctness of these letters as copies be hereafter verified by comparison with Mr. Cheever's letter book, and that Mr. Cheever be connected with the writing of the same, said copies to be compared with Mr. Cheever's letter book by the examiner and certified to by him as correct.

Adjourned till Tuesday, the 5th inst., at 11 a. m.

NEW YORK, *July* 5, 1887.

Parties met pursuant to adjournment.

Present: Counsel as before.

The examiner here states that on Saturday, the 2d inst., he attended at the office of Mr. C. A. Cheever, 13 Park row, with the copies of the letters handed to him by Mr. Tomlinson at the last session, and that there compared said copies with the letter books of said Cheever, and that said copies as now corrected by the examiner are true and correct copies from said letter books and of the whole of said letters as copied in said books.

Examiner also says that at the request of complainant's counsel, as made at the last session, he asked Mr. Cheever to restore the telegram heretofore detached by him to the set of papers now in the custody of the examiner, as the agent of Mr. Cheever, for the purposes of this examination, as heretofore appears on this record, but that Mr. Cheever declined to do so, saying substantially, 1113 that it related to confidential matters between himself and Mr. Baldwin, said telegram being referred to in statement of defendant's counsel immediately following cross-question 217.

X Q. 240. Please look at the letters I now hand you and state whether you remember receiving the same from Mr. Cheever at about the time of their respective dates.

Question objected to as being incompetent, irrelevant and immaterial upon any issue in this case, and not cross-examination. And complainant's counsel gives notice to defendant's counsel that all this testimony brought out from this question, and all of the foregoing questions and answers to and of the witness in his examination-in-chief as defendant's witness, and that he shall insist upon his right to treat the witness as defendant's witness in his re-examination of him, and that he will move in due time to strike out the deposition in so far as it pertains to this so-called cross-examination.

A. I remember receiving letters from Mr. Cheever during the period included in the dates of these so-called copies. I remember the subject-matter of some of the things spoken of in these copies; I do not remember the letters otherwise.

X Q. 241. Have you any substantial doubt that letters of which these are copies were written by Mr. Cheever and received by you?

Same objection and same notice.

A. I have no doubt that all of them were written by, or for Mr. Cheever at his dictation and copied in his letter book. The only doubt I have about my receiving them, or his sending them, is that sometimes he told me on meeting me that he had written letters to me, but thought better to call upon me instead, in the morning as he came down town on the way to his office, and having talked with me, I did not receive his letters, I suppose he did not send them; whether these copies are any of those I don't know.

1114 X Q. 242. I do not understand from your answer whether you have any doubt as to receiving these letters, or not; can you not answer me categorically whether you have any doubt as to having received them?

Same objection and notice.

A. I have doubt as to my having received all of the letters, for the reasons stated in my last answer; it is highly probable to my mind that I received most of them, and I cannot say that I did not receive all of them, nor can I say that I did.

X Q. 243. Are you able to point out which of these letters you have doubts concerning receiving?

Same objections and notice.

A. I am not.

Defendant's counsel offers in evidence the following letters from Charles A. Cheever to Albon Man as follows:

Letters dated January and marked Defendant's Exhibit "Cheever-Man Letter of January."

Letter dated January 5, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of January 5, 1880."

Letter dated January 7, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of January 7, 1880."

Letter dated January 7, 1880, and marked Defendant's Exhibit "2d Cheever-Man Letter of January 7, 1880."

Letter dated January 20, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of January 20, 1880."

Letter dated January 26, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of January 26, 1880."

Letter dated February 26, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of February 26, 1880."

1115 Letter dated March 27, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of March 27, 1880."

Letter dated May 12, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of May 12, 1880."

Letter dated June 22, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of June 22, 1880."

Letter dated July 24, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of July 24, 1880."

Letter dated September 30, 1880, and marked Defendant's Exhibit "Cheever-Man Letter of September 30, 1880."

Each and all of the foregoing letters objected to as incompetent, irrelevant and immaterial upon any issue in this case, and not cross-examination, and notice of motion is given to strike them out.

The witness states that of the above letters he has no doubt of having received the one dated June 22d, 1880, and the one dated July 24th, 1880, as he holds in his hands the originals of these letters produced to him by plaintiff's counsel, having been previously given to plaintiff's counsel by me years since, and left in his possession until now.

It is stipulated between counsel that the letters just put in evidence are the copies of the letters compared by the examiner, and referred to in his statement made upon the record at the commencement of this session.

Defendant's counsel offers in evidence the following:

No. 1. Telegram from W. D. Baldwin to Chas. H. Cheever, dated January 6th, 1880, and the same is marked Defendant's Exhibit "Baldwin-Cheever Telegram, January 6, 1880."

1116 No. 2. Telegram from Wm. D. Baldwin to Chas. A. Cheever, dated January 6, 1880, and marked Defendant's Exhibit "2d Baldwin-Cheever Telegram of January 6, 1880."

No. 3. Telegram from Baldwin, Hopkins & Peyton to Chas. A. Cheever, dated January 7, 1880, and marked Defendant's Exhibit "Baldwin, Hopkins & Peyton-Cheever Telegram of January 7, 1880."

No. 4. Telegram from Wm. D. Baldwin to Chas. A. Cheever, dated January 5, 1880, and the same is marked Defendant's Exhibit Baldwin-Cheever Telegram of January 5, 1880.

No. 5. Telegram from Chas. A. Cheever to William D. Baldwin, dated January 6, 1880, and marked Defendant's Exhibit Cheever-Baldwin Telegram of January 6, 1880.

No. 6. Telegram from William D. Baldwin to Chas. A. Cheever, dated January 7, 1880, and marked Defendants' Exhibit Baldwin-Cheever Telegram of January 7, 1880.

No. 7. Press copy of letter from Wm. D. Baldwin to Thomas Wallace, pres't of the Electro Dynamic Light Co., dated January 8, 1880; and the same is marked Defendants' Exhibit "Baldwin-Wallace Letter of January 8, 1880."

No. 8. Memorandum signed by Chas. A. Cheever, and witnessed by William D. Baldwin, and dated January 8, 1880; and the same is marked Defendant's Exhibit "Memorandum of Agreement of January 8, 1880."

No. 9. Letter of Amos Broadnax to Charles A. Cheever, dated January 8, 1880, and the same is marked Defendant's Exhibit "Broadnax-Cheever Letter of January 8, 1880."

No. 10. Letter of Arnoux and Hochausen to Charles A. Cheever, dated January 9, 1880, and the same is marked Defendant's Exhibit "Arnoux and Hochausen-Cheever Letter of January 9, 1885."

1117 No. 11. Bill dated February 1st, 1880, electric lamps, "horseshoe," to Charles A. Cheever, treasurer, for $344.04, and the same is marked Defendant's Exhibit "Horseshoe Cheever Bill of February 1st, 1880."

No. 12. Bill from Hopkins, Baldwin and Peyton to Charles A. Cheever, dated February 1, 1880, for $302.81, and the same is marked Defendant's Exhibit "Hopkins, Baldwin and Peyton-Cheever Bill."

No. 13. Letter from William D. Baldwin to Charles A. Cheever, dated April 27, 1880, and the same is marked Defendant's Exhibit "Baldwin-Cheever Letter of April 27, 1880."

No. 14. Letter from William D. Baldwin to Charles A. Cheever, dated April 27, 1880, and the same is marked Defendant's Exhibit "Baldwin-Cheever Letter of April 27, 1880."

No. 15. Letter from William D. Baldwin to Charles A. Cheever, dated April 29, 1880, and the same is marked Defendant's Exhibit "Baldwin-Cheever Letter of April 17, 1880."

No. 16. Letter from Frank L. Pope to Charles A. Cheever, dated May 12, 1880, and the same is marked Defendant's Exhibit "Pope-Cheever Letter of May 12, 1880."

No. 17. Letter from William D. Baldwin to Albon Man, dated September 27, 1880, and the same is marked Defendant's Exhibit "Baldwin-Man Letter of September 27, 1880."

No. 18. Letter from Albon Man to Charles A. Cheever, dated December 12, 1880, and the same is marked Defendant's Exhibit "Man-Cheever Letter of December 12, 1880."

Each and all of the foregoing exhibits are objected to upon the ground that none of them is proved to be letters, papers, or telegrams written or sent by the parties mentioned in them, or received by the parties to whom they are addressed; and upon the further grounds that they are incomplete, irrelevant and immaterial
1118 upon any issue in the case, and upon the further grounds
that they are not proper cross-examination—not referring to anything brought out by the examination-in-chief—and notice is given of motion to strike them out of the record. Said exhibits are further objected to upon the ground that no connection or privity is shown between the complainant in this action and these letters or exhibits, and the writers, senders or receivers of them. And complainant's counsel demands that defendant's counsel states upon the records how these exhibits, or any of the exhibits put in by him, or any of the testimony given by the witness upon his so-called cross-examination, is pertinent, relevant or material upon any issue in this cause, or how his examination of the witness is in any sense a cross-examination, and upon his failing to do so, he gives him notice that he will instruct the witness not to answer any questions appertaining to said exhibits, and requests the examiner to certify the whole of the witness' deposition to the court, and will thereupon submit to the court whether the witness must answer, and whether the so-called cross-examination is in fact a cross-examination, and whether it shall stand as part of the testimony in the case, or shall be stricken out.

Complainant's counsel submits the witness for cross-examination, and the witness will answer fully upon any matter brought out in the examination-in-chief. This entry is made upon the record in the absence of the witness.

In response to the request of counsel for complainant, counsel for defendant state that they propose to show:

1st. That the invention forming the subject-matter of the patent in suit was never in fact made by Sawyer & Man, and

2d. That if made it was abandoned by them, and that upon such defenses the testimony referred to is material.

1119 Counsel for complainant, in view of the response made by defendant's counsel, consents that the examination proceed, but does not waive his objection to the testimony on the ground that it is not cross-examination, or that it is pertinent, relevant or material or competent upon any issue in this case, but insists upon his objection, and gives notice of motion to strike out the matter objected to.

Adjourned till Wednesday, the 6th inst., at 11 a. m.

NEW YORK, *July 6th*, 1887—11 a. m.

Parties met pursuant to adjournment.

Present, counsel as before.

X Q. 244. Defendant's Exhibit "Memorandum of Agreement of January 8, 1880," the agreement made with Mr. Cheever in regard to the invention in controversy?

Same objection and notice.

A. The paper shown me appears to be solely a memorandum of Mr. Cheever's. It conforms substantially in terms to the agreement between Mr. Cheever and the Electro Dynamic Light Co., according to the best of my recollection of that bargain. It has reference to the whole or a part of the subject-matter of the controversy in this action.

X Q. 245. Were you aware of Mr. Cheever's telegraphing Mr. Baldwin to come on here to New York to prepare the application?

Same objection and same notice.

A. I do not recollect, but I think it probable that Mr. Cheever told me that he had done so, or would do so.

X Q. 246. Were you aware of Mr. Cheever's efforts to ascertain the status in the Patent Office of Mr. Edison's applications for patents?

Same objection and notice.

1120 A. I was not, except that it seems to me that Mr. Cheever was anxious as I was myself to get this application filed before any patent should issue to Mr. Edison or anybody else for this invention, and I think I knew that Mr. Cheever was watching each issue of patents as it was published.

X Q. 247. Did you know, or have any reason to believe or suspect that Mr. Cheever was endeavoring to ascertain the situation or condition of Mr. Edison's application for patents?

Same objection and notice.

A. I did not know, or have any reason to suspect that Mr. Cheever was seeking any information in any way, in regard to Mr. Edison's application or the applications of any others for their inventions in any surreptitious manner, nor to obtain any information which he might not legally and properly obtain, and have from the Patent Office, or from other sources. I did know that Mr. Cheever was very closely watching and trying to obtain information about all inventions having reference to electric lighting, and his information upon the subject was very great, and seemed to me to come from the inventors themselves (including Mr. Edison's) very largely.

Defendant's counsel moves to strike out the answer of the witness as irresponsive.

X Q. 248. Did you know, or have any reason to believe or suspect that Mr. Cheever was endeavoring to ascertain the status of Mr. Edison's applications in the Patent Office?

Same objection and notice.

A. If you mean by this, applications not yet resulting in patents or issues made public, no.

X Q. 249. Did Mr. Cheever show you, or ever inform you of the
telegrams from Mr. Baldwin or from Baldwin, Hopkins & Peyton,
Defendant's Exhibits "Baldwin-Cheever Telegram, January 6,
1880." 2d, Baldwin-Cheever Telegram of January 6, 1880. Bald-
win, Hopkins & Peyton-Cheever Telegram of January 7,
1121 1880. Baldwin-Cheever Telegram, January 5, 1880. Bald-
win-Cheever Telegram of January 7, 1880.

Same objection and notice.

A. I don't think I ever knew or heard of any of these telegrams, further than I think Mr. Cheever told me that Mr. Baldwin, of Washington, would represent the application for the patent.

X Q. 250. Mr. Cheever wrote you on January 20, 1880, Mr. Baldwin says that "the horseshoe and fibrous application" is held for interference by the Patent Office. When you received this letter did this strike you as a peculiar fact for Mr. Baldwin to know?

Same objection and notice.

A. I don't know that I received the letter in the first place; in the second place, if I received it then I have no recollection of how it struck me. In the third place, it does not now strike me as anything peculiar or singular.

X Q. 251. Had you known of the telegrams concerning which I have asked you, would you have considered the action of Mr. Baldwin, in endeavoring to ascertain the condition or position of the Edison application as peculiar and improper?

Same objection and notice.

A. It would depend upon whether Mr. Baldwin was trying to find out what he had no right to know, or of what he had a right to know.

X Q. 252. Did you know then, or do you know now, whether a person can properly obtain from the Patent Office, knowledge of what an inventor has applied for a patent upon or the condition of his application?

Same objection and notice.

A. I do not think that my information then or now is very accurate as to what is kept secret by the Patent Office or what is public. I did, however, then know, or believed I did,
1122 that parties other than the applicant for the patent, had a right to know and be informed by the Patent Office under certain circumstances as to at least parts of what was sought to be patented, and perhaps the whole.

X Q. 253. Under what circumstances could parties other than the applicant obtain information, in your judgment?

Same objection and notice.

A. Parties to interference, parties who had filed caveat upon the same subject-matter, and perhaps, though I am not certain, parties seeking to be put in interference with known or publicly claimed inventions.

X Q. 254. What do you mean by "known or publicly claimed inventions"?

Same objection and notice.

A. I mean the inventions of those who publish the facts of their inventions and of claiming patents for them, or of having made applications for patents for them. In other words, I see no reason for the Patent Office keeping secret which parties themselves make public and advise others of.

X Q. 255. If, prior to the filing of any application by Sawyer & Man, you had known that Mr. Baldwin was endeavoring to obtain from the Patent Office information as to what Mr. Edison had applied for patents on, or the condition of such application, would you have considered his action improper?

Same objection and notice, and further objection that the question is purely hypothetical, and based upon a state of facts not proved to exist, and directed to a person who confessedly has no knowledge of the patent laws; could not know what was improper and what was proper. Moreover, as a matter of fact, that it was strictly proper for Mr. Baldwin to ask the examiner any question he chose, and to take his answer and make such use of it as was proper in the practice of his business.

A. It would depend entirely upon the circumstances of the case. I might think it entirely proper or the reverse.

1123 X Q. 256. If, prior to Sawyer & Man filing the application for the patent in suit, you had known that Mr. Baldwin was endeavoring to ascertain from the Patent Office whether Mr.

Edison had an application for a horseshoe conductor, or a fibrous carbon, and what the state and conditions of such applications were, would you have considered his conduct proper?

Same objection and notice.

A. Without pretending to know or decide whether Mr. Baldwin's action was proper or not, it strikes me that the fact that prior to this time, Mr. Edison had made publication claiming such inventions, and at the same time the publications in regard to his applications for patents were inserted in the newspapers of the day, that it would be entirely proper for Mr. Baldwin being employed, or about to be employed, to prosecute an application for a patent for the same matter, to seek information at the Patent Office as to whether any patent had been issued, or was about to issue for the same matter to Mr. Edison, and to ask questions at the Patent Office in regard to the same, understanding that the examiner and Patent Office officers would withhold such information as was not proper to be made public or to be communicated to Mr. Baldwin under the circumstances, and that it would be entirely proper for Mr. Baldwin to make use of the information so obtained, and communicate it to those who had employed him.

X Q. 257. If, then, you had known that Mr. Baldwin had obtained from the Patent Office information to the effect that the application of Mr. Edison had not passed for issue, you would not have considered his action in getting this information improper?

Same objection and notice.

A. Not necessarily. He could have asked the examiner whether any patents had passed to issue to Mr. Edison lately, and if 1124 the examiner had said no, as seems to me he properly might, the information would have been properly obtained by Mr. Baldwin, and under other conceivable circumstances Mr. Baldwin might have properly obtained this information; but it nowhere appears that this information, or any information, was obtained by Mr. Baldwin from the Patent Office, or through the Patent Office, or that it was not voluntarily communicated to him by Mr. Edison or his agents.

X Q. 258. Now, I understand that you do not know, and never did know, what Mr. Baldwin did, so far as obtaining information from the Patent Office is concerned. Is this correct?

Same objection and notice.

A. I do not know now, and I do not recollect that I ever knew, and I do not believe that I ever did know what Mr. Baldwin did in the matter of obtaining information from the Patent Office, or elsewhere.

X Q. 259. In your 256th answer, you say that "prior to this time (referring to the Sawyer and Man application), Mr. Edison had made publications claiming such inventions." What inventions did you refer to?

Same objection and notice.

A. I referred to the loop-form of carbons, particularly as connected with paper carbons.

X Q. 260. What publications do you refer to?

Same objection and notice.

A. Prior to this time different people came to see me, stating that they had been out to Menlo Park and seen Mr. Edison's electric lamps exhibited there, and described them, and told me the shape and character of the carbons as they had seen it and been told about it at Edison's exhibition at Menlo Park. I do not now remember in detail the publications in the newspapers and magazines, except the one you have referred to—the New York Herald of December 21, 1879; but it seems to me that there were others besides that.
1125 Certainly other papers were publishing about it, possibly copies or extracts from the New York Herald.

X Q. 261. Please to tell me all you remember concerning the preparation for the application of the patent in suit, beginning with the time when you first saw Mr. Baldwin, stating fully what you did in connection with the matter?

Same objection and notice.

A. The final preparations on Mr. Baldwin's coming here of the application was by his taking up for the specifications what Mr. Sawyer and I had told Mr. Cheever, and probably also Mr. Baldwin, before that time, about the making and use of the invention. My recollection is that prior to Mr. Baldwin's coming, which was on the 7th or 8th of January, 1880, a meeting of the directors of the Electro-Dynamic Light Co. was held, at which Mr. Sawyer was present. My recollection is that Mr. Cheever was either present at the meeting or was communicated with during its progress. At that meeting Mr. Sawyer consented to unite in an application for the patent, and to assign it to the Electro-Dynamic Light Co., and a memorandum of the claims to be contained in the patent was made out by me and approved by Mr. Sawyer. Mr. Baldwin was furnished with this memorandum in regard to the claims, and went on to prepare the application for the patent. Mr. Sawyer was not present, nor was I, during the preparation of the application. During the day I was sent for to come to Mr. Cheever's office, and told that Mr. Sawyer had refused to execute the application, claiming that it was not what had been agreed upon between him and me. I then sent to Mr. Sawyer the memorandum that had been made between himself and me, the same as given Mr. Baldwin, I think; and sent word to him that I would execute the application if he would. My recollection is that he made some slight alteration in the memorandum which I sent to him, returned it to me, stating again that the claims were not according to that memoran-
1126 dum. I cannot recollect for a certainty, but think he sent some other paper back, of claims which he proposed. Sawyer sent word that if the papers were brought back to him, and he liked them, he would sign them, and wanted Mr. Cheever or Mr. Baldwin, or both of them, to come and see him. I went away for

my counsel, Mr. Amos Broadnax and Mr. William Man, to advise with me and Mr. Thomas Wallace in regard to the matter. Mr. Wallace came to Mr. Cheever's office; Mr. Wm. Man, Mr. Broadnax and myself also went there; new papers were prepared or the others amended. Mr. Cheever and Mr. Baldwin, I think, and a notary public, went to Mr. Sawyer. I cannot be certain about Mr. Cheever going, but that is the best of my recollection. It may have been Mr. Cheever's man who had been to see Mr. Sawyer before with the notary public.

They were gone a long time. Meanwhile, Mr. Broadnax, Mr. Wm. Man and myself remained, and Mr. Wallace went away, leaving the matter in our hands. The parties finally returned with the application executed by Mr. Sawyer, but not in the precise form in which they took it away. I took the application, and, after consultation over it with Mr. Broadnax and Mr. Wm. Man, I executed it and swore to it before a notary, and gave it to Mr. Cheever or Mr. Baldwin or both of them. Before I went, I required from Mr. Cheever or Mr. Baldwin that the application should be filed immediately. Upon receiving their assurance that it should be done, and that I should be advised by telegraph of its filing the next day from Washington, Mr. Broadnax, Mr. Wm. Man and myself left.

X Q. 262. Do you know what has become of the memorandum of the claims for the patent prepared by you and approved by Mr. Sawyer, and referred to in your last answer?

Same objection.

A. I gave them to Mr. Broadnax.

1127 X Q. 263. Who informed you that Mr. Sawyer had refused to execute the application, claiming that it was not what had been agreed upon by him and you, as stated in your 261st answer.

Same objection.

A. Mr. Cheever and Mr. Baldwin, or both of them, orally.

X Q. 264. By whom did you send to Mr. Sawyer the memorandum of the claims prepared by you, with the word that you would execute the claims if he would?

Same objection.

A. I don't know who the messenger was; I think it was an oral message.

X Q. 265. Who brought you back word from him that the claims were not according to this memorandum?

Same objection.

A. I think the same messenger.

X Q. 266. Do you remember whether you executed the application in Mr. Cheever's office?

Same objection.

A. I think I did.

X Q. 267. Do you know what the occasion was of Mr. Baldwin writing to Mr. Wallace the letter of January 8, 1880, "Defendant's Exhibit Baldwin-Wallace Letter of January 8, 1880"?

Same objection.

A. I think it was a requirement of the Electro-Dynamic Light Co., in order that Mr. Baldwin should be the attorney of the company, and to make it clear that the company had a right to substitute another attorney at any time, and to control the prosecution of the application.

X Q. 268. Were you cognizant at the time of the writing of this letter?

Same objection.

A. I think so.

1128 X Q. 269. Were you the person who requested the writing of the letter?

Same objections.

A. I don't know whether I or Mr. Wallace required it to be written.

Adjourned till Thursday the 7th inst., at 1 p. m.

THURSDAY, *July* 8, 1887.

Met pursuant to adjournment.

Present, counsel as before, and the cross-examination of Mr. MAN continued as follows:

X Q. 270. Were you the active person in the negotiation with Mr. Cheever?

Same objections and notice.

A. I was one of them.

X Q. 271. Between the time that Mr. Cheever first saw you in regard to purchasing the alleged invention, and the day on which the application for a patent was signed, had you seen Mr. Wm. E. Sawyer in regard to the matter?

Same objections and notice.

A. Yes, I think so; that is my recollection.

X Q. 272. How many times should you say?

Same objection and notice.

A. Two or three times, perhaps.

X Q. 273. Was the sale of the invention to Mr. Cheever discussed between Mr. Sawyer and you?

Same objections and notice.

A. My recollection is that it was.

X Q. 274. Did Sawyer tell you he had seen Cheever?

Same objections and notice.

A. I do not recollect.

X Q. 275. Did you tell Sawyer you had seen Cheever?

Same objection and notice.

A. I think so.

1129 X Q. 276. Did you tell him the purpose of Mr. Cheever's call upon you?

Same objections and notice.

A. I do not remember the exact conversations between Mr. Sawyer and myself. They had reference generally, first, to Mr. Sawyer's uniting with me in an application for a patent for this invention; secondly, to Mr. Cheever's being desirous of obtaining the invention or some part of it; and thirdly, after Mr. Cheever had given an intimation more distinctly, that he desired to buy, and the price he would be willing to pay, the consultation had reference to the claims to be made in an application for a patent. In such a consultation it must have been spoken of, or understood between us, that we had both seen, or conferred with Mr. Cheever.

X Q. 277. Did Mr. Sawyer show you the letters he had received from Mr. Cheever?

Same objections and notice.

A. I have no recollection that he did, and think and believe he did not.

X Q. 278. Have you any reason to think that anything was concealed from Mr. Sawyer, or is it your understanding and recollection that he was cognizant of Mr. Cheever's negotiations, and understood his purposes so far as you understood it?

Same objections and notice.

A. I have no reason to think that anything was concealed from Mr. Sawyer which I understood or knew. I don't think Mr. Sawyer knew, and I don't think I then knew of any negotiations or correspondence of Mr. Cheever with other parties than Mr. Sawyer, the Electro-Dynamic Light Co. and myself. In other words, Mr. Cheever was not in the habit of disclosing, and certainly did not to me, very much of his plans, purposes or negotiations with other people.

1130 X Q. 279. You understood, after seeing Mr. Cheever, did you not, that he was not proposing to buy the invention himself, but wanted a refusal to buy it, expecting to sell it to others.

Same objections and notice.

A. After I first saw Mr. Cheever, how long I can't remember, I understood Mr. Cheever was desirous of purchasing the invention himself, and associating others with him in interest in the matter.

X Q. 280. Are you speaking of a time subsequent or prior to the application?

Same objection and notice.

A. Prior. It is proper to add that Mr. Cheever declined, before the option of purchase was given to him, to tell me what he would do with the patent to be obtained for the invention.

X Q. 281. Do you mean to state that prior to the filing of the application you did not understand that Mr. Cheever desired an option, and expected to sell the invention to parties other than himself?

Same objection and notice.

A. I did understand that Mr. Cheever expected to interest other parties, but I got the idea that Mr. Cheever himself intended to remain interested.

X Q. 282. Did you understand that he expected to sell the invention for a price larger than his option?

Same objection and notice.

A. No. I understand that he expected to make money out of the transaction, whether by selling the invention at a larger price as a whole without retaining any interest in it or by interesting others with him to make money out of the interest he should retain. I do not know, nor did not know whether he expected to retain his interest in the invention, such as he could do and obtain the money to pay for it from the other parties interested, but I got the idea
that he expected to personally be interested in or have a
1131 share of the invention or rights under it; at the same time
I did fully understand that Mr. Cheever could, if he saw fit to do so, sell the patent and not retain any interest in the invention.

X Q. 283. What did you understand Mr. Cheever to mean by his letter, Defendant's Exhibit "Cheever-Man Letter of January, 1880," by his statement that to "sell the Sawyer light invention it is of the utmost importance I should have the refusal," and by the further statement that "the object of my present customer would be frustrated to a great degree, and it is doubtful if he would want it all," if the Edison excitement dies out before you give me a chance to take action?

Same objection and notice.

A. I understand that Mr. Cheever would not want to buy it or wanted me to think he would not want to buy it.

X Q. 284. Is that the best answer you can give to my question?

Same objection and notice.

A. I might add more to it.

X Q. 285. Was this letter the first suggestion from Mr. Cheever that he had a customer for the invention?

Same objection and notice.

A. I don't know; it was not the first suggestion that he had parties who wanted to be interested in the matter, or whom he could interest in the matter.

X Q. 286. It would seem from this letter that on the Saturday previous to its date, you and Cheever had been talking of the sale of the invention by him (Cheever). Is such your recollection of the fact?

Same objection and notice.

A. Yes.

X Q. 287. It appears that on January 7th, Cheever sent you a formal letter addressed to your company in regard to a continuance of time in the arch-form electric matter. To what did this continuance of time refer?

Same objection and notice.

1132 A. The letter dated January was written I think by Mr. Cheever to me on Thursday or Friday, probably Friday, of the week prior to my letter to him of January 5th, and had reference to a conversation which took place the Saturday previous to his writing the letter in which the subject-matter of the sale to him was discussed. I think that there must have been some understanding between Mr. Cheever and the Electro Dynamic Light Co., that he would make definite proposition at some time prior to an elapsing time which he had in mind while writing the letter of January 7, and that he wanted more time in which to make his proposition or to carry it out. My impression is that the first idea was that Mr. Cheever should pay the money down at the time of the making of the application, but I am not certain of this.

X Q. 288. Prior to January 7, had you or the Electro Dynamic Light Co. given Mr. Cheever any time in which to do anything with this invention?

Same objection and notice.

A. It would appear by the letter that we had, or had told him that if he did certain things by that time it would probably be accepted.

X Q. 289. Have you any recollection in regard to this subject?

Same objection and notice.

A. Yes

X Q. 290. It would seem from this letter that you understood Mr. Cheever's views, for he asks you, when asking for a continuance of time, to explain his views to your associates. Now does this letter refresh your recollection, and, if you remember, please state the time and for what purpose Mr. Cheever desired a continuance, and who prior to January 7th had given him this time?

Same objection and notice. Counsel for complainant instructs the witness not to deduce or infer anything that may appear on the face of the letters, but to state only what he recollects.

1133 A. I recollect that prior to the refusal which was given to Mr. Cheever by the Electro Dynamic Light Co., on the 8th or 9th of January, other negotiations for the sale of the inventions in controversy had been had with Mr. Cheever, by which he was to take some action or do something, what I do not distinctly recollect, by some fixed time. My impression is, it was to pay some money and make a definite proposition to the company.

X Q. 291. Was there any meeting of the board of directors of the Electro Dynamic Light Co. between January 1st and January 8th, 1880?

Same objections and notice.

A. My recollection is that there was.

X Q. 292. Where are the minute books of the company?

Same objection and notice.

A. I don't know.

X Q. 293. In whose possession did you last see them, and when?

Same objection and notice.

A. I don't remember.

X Q. 294. After the application for the patent was filed, did Mr. Baldwin continue to have charge of it until Mr. Broadnax was substituted?

Same objection and notice.

A. I think so.

X Q. 295. Were you aware, prior to January 8, 1880, of Mr. Cheever's having made any contract with Mr. Sawyer?
